Clement Dunforth's appearance was certainly in his favor, though Noel could not help thinking that this grave young lawyer was the last person to have won the affections of one so thoughtless as Irene. He had none of those ready smiles and little gallantries at hand which would have recommended him to her, and occasionally there was a flash in his deeply-set eyes, and a stern knitting of his brows, that would have made a more sensitive girl feel half afraid to offend him. Yet the impression that he had a stern, ill-restrained temper, was generally forgotten when he began to speak, for he had such a low, well modulated, and thrilling voice, that some had been heard to say Mr. Clement Dunforth would owe to it his successes at the bar.

He evinced no embarrassment when ushered into Noel's room, though he must have seen how keenly and anxiously he was being surveyed; and it was with a happy blending of self-respect and cordiality that he made a few polite inquiries, and congratulated the invalid on the progress he had made. Yet, in spite of the favorable impression his address created, Noel was conscious of being repelled by an intangible something in his visitor's look and manner for which he could not account. No one could express himself in choicer language, no one appear more desirous to win his esteem, or more deserving of it, and Noel, searching in his heart for the reason why he could not reciprocate these friendly advances, began to think it must lie with himself; that his long illness, and his annoyance at Mrs. Estcourt's reticence, had combined to render him irritable and distrustful.

"Irene has given me no satisfactory reason," he said, presently, "why I have been kept in ignorance of an engagement to which she tells me that her mother has consented:"

"Yes," said Mr. Dunforth, answering the latter part of this speech only, "Mrs. Estcourt consents, and I hope we shall see more of each other, Lord Carlsforde. Irene is so proud and fond of her brother, that for her sake you and I must be good friends."

This was very pleasantly said, but it did not touch upon the sore topic of the concealment that had been practiced; and Noel returned to it.

"I hope with you that we shall be able to be friends; but why, I ask, have I not been made acquainted with the engagement?"

"Pardon me, you did not ask me why; nor could I have answered, if you had. You must not make me answerable for any of Mrs. Estcourt's arrangements."

Noel bit his lip.

Was it, then, wholly the fault of his step-mother? and had she been foolish, nay, wicked enough to lead this young man into a proposal made perhaps in the belief that Irene would be handsomely dowered. The suspicion had already crossed him, and he felt that Clement's mind must be immediately disabused.

"I may not discuss Mrs. Estcourt's motives for her silence; doubtless they are good ones, and she has a right to dispose of her daughter as she pleases; but, as Irene's nearest relative, I hope I may be permitted to inquire if you are aware that she is wholly without fortune?

Clement bowed.

"She has herself been impressing this fact upon me within the last hour."

"But you were not aware of it when you declared yourself. You imagined, naturally enough, that as the sister of a peer she would have a marriage portion."

"My dear Lord Carlsforde, you forget that I was paying my addresses to Miss Estcourt before you succeeded to the title," was the suave reply.

"And yet I knew it not," muttered the perplexed Noel. "Why did I not hear this from you, Mr. Dunforth? Did Mrs. Estcourt request you to keep me in the dark?"

"Certainly not; but, on the other hand, she did did not refer me to you; and by the time I began to think it odd that you testified no interest in an affair that so nearly concerned your sister's happiness, I learned that Viscount Carlsforde was dead, and you had quitted London."

"As Mrs. Estcourt practises so much secrecy," exclaimed her aggrieved step-son, "she may not have thought proper to tell you the position in which the late Lord Carlsforde's will has placed me."

Clement Dunforth looked politely attentive, and Noel briefly explained how her father's remorseful affection for his child had rendered the heir to the title penniless.

"But you will marry the lady," was the comment, spoken so confidently that Noel reddened with angry emotion.

"No, sir; I certainly shall not attempt to wed an unfortunate girl solely that I may enjoy her properly. Never! And Miss Carlsforde has testified a repugnance to the scheme as great as my own, by withdrawing from the house until I am sufficiently recovered to quit it. As this is a very distasteful topic to me, we will now take leave of it for ever, Mr. Dunforth. I should not have alluded to it if I had not felt that it was only just to you to make you understand that Irene brings you nothing but herself."

"Thanks for your candor, but the explanation was quite uncalled for. I am not mercenary, and some of my legal friends are wont to say that those fellows often succeed most who have nothing to back them but their own energies. We will hope that this will be my case."

"Then, as yet, you have no standing at the bar?"

"No standing!" Mr. Dunforth coolly echoed. "I have my reputation to make, as well as my fortune."

"And yet you meditate marriage. Isn't this rather rash?"

"It would be very," was the smiling reply, "if I contemplated rushing into wedlock before the tables and chairs are purchased. Irene must be content to wait till I can make her a home."

Realizing how positively his sister had assured him that Clement would hear of no delay, Noel did not know how to reconcile such conflicting speeches; but, at the risk of being considered over officious, he asked if, under these circumstances, Mr. Dunforth had acted wisely, or even rightly, in persuading Irene to agree to what might be a long and therefore unsatisfactory engagement.

"I might answer that, as Mrs. Estcourt consents to entrust me with her daughter's happiness, no one else has a right to interfere," Clement answered, but in so smiling and suave a manner, that it would have been difficult to take offense; "but, to Irene's brother, I shall only say—yes, I am forced to admit that it was a selfish act on my part; but I cannot wish it undone."

"Irene is so young," her brother expostulated. "I fail to see how you, at least ten years her senior in age, and double that in worldly experience, could have been attracted by my childish sister."

"Am I the first man who has had a fancy for educating a wife to his mind," laughed Clement, rising from his seat. "You will find a spice of romance, Lord Carlsforde, in the most matter-of-fact of our sex. But your attendant is making signs to me that I have overstayed my time. May I come and see you again to-morrow? I am collecting some information at Corby, and Mrs. Hurst kindly invites me to spend all my leisure here. Do you indorse the invitation?"

"Impossible! I am not in my own house," answered Noel, shortly.

"Well then, I shall accept without your doing so, and spare you the responsibility of answering for my good behavior. Adieu, till to-morrow."

But when Clement Dunforth reached the door, he suddenly returned to lean over the bed, and, with suppressed eagerness, exclaim:

"One question before I go. That girl—Hillian Gray! It is not the first time that I have met her. What is she doing here?"—To be continued.

SCIENTIFIC TEMPERANCE.

This is the new basis on which, we are persuaded, temperance doctrine will win brilliant victories in the near future. Scientists are giving close and successful study to the action of drinking habits on the structure of the brain. Within a few years great progress has been made in giving us the physiology of drunkenness. We have long known what are the general moral and mental effects of intemperance. The destruction of conscience, judgment and will, and the wider physical and social results are patent to the commonest observation. It makes wonderful transformations of the mind, body and social organism. The world has long known it is the most gigantic evil in the way of the world's progress and happiness. In a general way the world has long known how thoroughly drunkenness wrecks the body and mind. The evidence is too common and the demonstration too appalling to leave room for ignorance of these final results. But late scientific investigations have given us the physiological and chemical reason of these last results.

It is in these the world should be profoundly interested. The scientific basis will furnish new temperance arguments and people who are too coarse to feel the appeal based on sentiment or morals may bow to one rested in science.

Microscopic examination has shown the effect of alcohol on the blood. Dr. Harriman in a series of experiments in Boston showed that alcohol produced these among other essential changes in red blood corpuscles. It acts specifically on the coloring matter, making it colorless. It distorts and in some cases wholly breaks up the red corpuscles and produces a parasitic vegetation in the fluid of the blood and hydro-carbon substances can readily be detected by the microscope. In throwing upon a screen magnified corpuscles, both of healthy blood and of that which had been subjected to the action of alcohol, the difference was marked and striking. The effect of the alcohol was thus shown to be destructive of the very life currents of the body and, of course, having a deteriorating effect upon the whole system.

But as the vigor and tone of the brain is largely dependent on the purity of the blood with which it is supplied, it is manifest that the effect of alcohol would be deleterious to the brain and to all mental action in precise ratio to the quantity taken into the system. Recent investigations have made it clear not only that alcohol is bad for the brain, but that it is specifically on the brain that it does its most harmful work. It is sometimes said of the drinker, "the liquor has gone to the brain." That is precisely where all liquor goes, not as a sanitary or tonic agent, but as a steadily and scientifically destructive agent.

It may work slowly, well-nigh imperceptibly in its hardening and deadening effect, but it surely goes to the brain of all who use it, it surely weakens that brain, and if taken in sufficient quantity will as certainly destroy reason and conscience, as it will destroy the body. Indeed, it has been shown that it acts first on reason and afterward on the body. It benumbs and confuses the drinker's brain, before it makes him stagger, or puts him to sleep. He is garrulous in a partially dethroned mind before he falls into the gutter.

There is a corollary to this scientific fact. Of course these experiments are made on the brains of inebriates. But the logic of them goes farther back, and infallibly points out the peril of moderate drinking. If alcohol goes to the brain to work destructively, it will do its work in the exact ratio of the amount of it. Proof alcohol will work faster than that which is diluted; distilled liquor, faster than fermented; but each will do its utmost to break down the man. Brandy will shoot the drinker most swiftly to the grave. But wine will slowly, and scientifically, according to the amount of alcohol it contains, work toward the same result.

If the conclusions of doctors are correctly drawn, they overturn totally and forever the idea advanced by moderate drinkers, that wine and beer are wholesome, but whiskey is ruinous. The difference is only one of degree.

A further argument for total abstinence is herein suggested by the fact that the taste for diluted alcohol is the precursor of a taste for purer alcohol. The moderate drinker uses wine for its alcohol. It is the alcohol effect he prizes. It will lead him on to seek more of it. But even should this not be the case, out of his wine he can in the course of years distil alcohol enough in his brain to weaken intellectual action and deaden moral sensibility. Thus science points the way of the Bible when it declares the unwisdom of the man who allows either wine or strong drink, either fermented or distilled liquors, to deceive him.—*The Interior.*

RIPPLES.

"Oh tell me, Leander," she said,
"Now what would you do were I dead?"
The warm glance of her eye
Begged some tender reply,
And she blushed as she hung down her head.

"I'd remember thee always, dear Jane;"
Then, biting the head of his cane,
He added in this saddening strain:
"For darling, you see
I never could be
Such a fool as to marry again."

THE TROUBLES OF A POET.

While Col. Bangs, editor of the Argus, (American) was sitting in his office one day, a man whose brow was clothed with a thunder entered. Fiercely seizing a chair, he slammed his hat on the table, hurled his umbrella on the floor, and sat down.

"Are you the editor?" he asked.

"Yes."

"Can you read writing?"

"Of course."

"Read that then," he said, thrusting at the colonel an envelope with an inscription on it.

"B——," said the Colonel, trying to spell it.

"That's not a B; it's an S," said the man.

"S? Oh, yes, I see. Well, the words look a little like 'Salt for Dinner,'" said the Colonel.

No, Sir," replied the man, "nothing of the kind. That's my name—Sam'l H. Brunner. I knew you couldn't read. I called to see about that poem of mine you printed the other day, on the 'Surcease of Sorrow.'"

"I don't remember it," said the Colonel.

"Of course you don't, because it went into the paper under the infamous title of 'Smearcase To-Morrow.'"

"A stupid blunder of the compositor, I suppose."

"Yes, sir, and that is what I want to see you for. The way that poem was mutilated was simply scandalous. I haven't slept a night since. It exposed me to derision. People think I am a fool. Let me show you."

"Go ahead," said the Colonel.

"The first line, when I wrote it, read in this manner:

'Lying by a weeping willow, underneath a gentle slope,'

That is beautiful, poetic, affecting. Now, how did your vile sheet present it to the public? There it is. Look at that. Made it read in this way—

'Lying to a weeping widow, to induce her to elope,'

That is too much—it's enough to drive a man crazy!"

"I'm sorry," said the Colonel; "but—

"And then take the fifth verse. In the original manuscript it said, plain as daylight—

'Take away the jingling money; it is only glittering dross,'

A man with only one eye, and a cataract over that could have read the words correctly. But your pirate upstairs there—do you know what he did? He made it read—

'Take away the jeering monkeys, on a sorely glandered hoss,'

By George! I felt like braining him with a shovel! I was never so cut up in my life."

"It was natural, too," said the Colonel.

"There, for instance, was the sixth verse. I wrote:

'I am weary with the tossing of the ocean as it heaves.'

It is a lovely line, too; but imagine my horror and the anguish of my family when I opened your paper and saw the line transformed into—

'I am wearing out my trousers, till they're open at the knees.'

That is a little too much! That seems to me like carrying the thing an inch or two too far. I think I have a constitutional right to murder that compositor: don't you?"

"I think you have."

"Let me read you one more verse. I wrote—

'I swell the flying echoes as they roam along the hills,
And I feel my soul awaken to the ecstacy that thrills.'

Now what do you suppose your miserable outcast turned that into? Why, into this—

'I smell the frying shoes as they roast along the hills,
And I feel my soul mistaken in the ecstacy that whirls.'

Gibberish, sir, awful gibberish! I must slay that man. Where is he?"

"He is out just now," said the Colonel. "Come in to-morrow."

"I will," said the poet; "and I will come armed."

Then he put on his hat, shouldered his umbrella, and drifted off down stairs.

An estimable Louisville young man who teaches a class at Sunday-school and occupies a prominent position in the choir has a fancy for the maiden who sings the alto. The last time he called on her he found her, with her father and mother, entertaining the minister. Concealing his disappointment with as much grace as he could command he joined the dignified circle and maintained his share of the conversation very creditably, considering the untoward circumstances. The minister who had been something of a traveler in his time, turned the talk to his hobby, and was reveling in a gorgeous description of his favorite country, Brazil, when the small boy of the family, who was building a block church on the floor spoke up: "Ma, has sister Floy ever traveled any?" "No, child, no—you mustn't speak when others are talking." "Then, when I was a-lyin' under the sofy Sunday night, and sister and Mr. John come in from church and was a-settin' in the big rockin'-cheer, how come her to say that the nicest land she ever was in was Lapland?"

"On one occasion when Phœbe Cary was at the museum in New York, looking about at the curiosities," says Barnum, "I preceded her and had passed down a couple of steps. She, intently watching a big anaconda in a case at the top of the stairs, walked off (not noticing them) and fell. I was just in time to catch her in my arms and save her from a dangerous fall. 'I am more lucky than the first woman was who fell through the influence of the serpent,' remarked Phœbe, as she recovered herself."

An old gentleman, without tact, on meeting some ladies whom he had known as girls in his boyhood, cordially remarked: "Bless me! How time flies! Let me see. It is fifty-two years come next April since we used to go to school together in the red school-house. I was a little chap, then, you remember, and you were fine young women." The old man could never understand why his cordial greeting was received so coldly.

"George," she said, to the perspiring young man, "I love you just the same, but as our city relatives are coming next week, mother thinks you'd better stay away, because your long hair and

freckled face might make them think our acquaintances weren't very high-toned." The young man is staying.

JULIA A. MOORE, the sweet singer of Michigan, was nearly paralyzed with astonishment when recently informed that *eclat* didn't rhyme with "he cat." She has not sufficiently recovered to finish her half-completed poem "On the Birth of a New Spring."—*Atlantic Monthly.*

AN ounce of honey consumed at luncheon costs the bee who manufactured it 960 miles of travel, and he gets no belt either.

RECENT LITERATURE.

Higher Education, and a Common Language. By PHILIP GILBERT HAMERTON, President McCOSH, Prof. ANGELO DE GUBERNATIS. New York: A. S. Barnes & Co. Price 40 cents.

The necessity for a common language which shall hold the place that Latin did in the Middle Ages; a language which shall make all the educated world akin, in speech at least, must be evident to the most indifferent observer. French is the language of polite society, and it is made the medium of communication in most diplomatic circles, but as Mr. Hamerton shows few, very few even among the educated classes ever *master* French. Latin, it is claimed, is too dead to be available, and there is a movement to make Greek the universal language. Modern Greek is near to the Greek of Plato, and a strong argument in its favor is its perfect adaptability to the expression of new ideas and the nomenclature of new things. Mr. Hamerton's paper is most interesting and suggestive.

The Reform in Higher Education, an anonymous article, presents the serious defects of our college education very forcibly, and the facts showing wherein lies the superiority of foreign methods, and the suggestions as to how our system can be best improved should obtain for the article the serious consideration of those who have the cause of education at heart. In Upper Schools, President McCosh, among many other recommendations, strongly urges that religion should be taught in our colleges by the ablest men in them. His views in this connection are liberal and his suggestions judiciously expressed.

Study of the Greek and Latin Classics, by Chas. Elliott, is an able defense of the study of the classics, one which it would be as well for those who sneer at dead languages to at least glance over. The remaining papers, The University System in Italy, Universal Education and Industrial Art Education in the United States, are carefully written and well worth a reading.

The Voyages and Adventures of Vasco de Gama. By GEO. M. TOWLE. Boston: Lee & Shepard.

This excellent work should meet with a cordial welcome from parents. The boys will read, and long ago they revolted from the milk and water literature of the average S. S. library. The good little boy who leads an exemplary life and dies at an extremely immature age, is nothing more than a monstrosity to them. They may respect his good qualities, but all the same they regard him as a "muff." What they want are tales of stirring adventure, with men of force and character for heroes. Failing to find anything to their taste in the books provided for them, they subscribe liberally for the newspapers which contain everything calculated to give them distorted views of life; to incline them to lawlessness, and to develope a contempt for parents, home and the refinements of civilized life. Brigands, cut-throats, tramps, are their ideals of manhood. It is to supply these same boys with wholesome, interesting reading, and to wean them from the pernicious literature of the flashy newspaper, that Mr. Towle has consented to write the Heroes of History, of which Vasco de Gama is the first. De Gama's history is full of striking adventures, thrilling incidents and perilous situations, and Mr. Towle, while not sacrificing historical accuracy, has so skillfully used his materials that we have a charmingly romantic tale, beside which the Indian blood and thunder stories of the "Boys' Weekly" are drivelling imbecility.

Emergencies; How to Avoid Them and How to Meet Them. Compiled by BURT. G. WILDER, M.D. New York: G. P. Putnam's Sons. Price, 15 cents.

This pocket manual is worth many times the price asked for it. Every family must, at times, feel the need of some such helpful little book. A review of the contents will give a fair idea of the scope of the work. Poisons in general, special poisons and ready antidotes, snake-bite, mad-dog bite, insects bites and stings, bleeding, kerosene and other combustible liquids, fire, burns and scalds, lightning, sunstroke, railway accidents, broken bones, shocks, blows, falls, lost, starvation, fainting, apoplexy, sea-sickness, foul air, coal gas, fire-damp, burning gas, choking, exhaustion, sudden fever, croup, diptheria, convulsions, taking cold, colic, toothache, icy sidewalks, morass, infectious diseases, drowning—how to rescue, how to restore—hot water method, Michigan method, holding the tongue, Harvard method, Sylvester method, inflating the lungs, hot iron method, electro-magnetic method, oxygen method, traction over the ribs, rolling on a barrel, rate of movements in artificial respiration, test of correctness, result of long submersion, when is a case hopeless? need of well-described cases of resuscitation, signs of death. The directions given are full and simple.

Meg: A Pastoral and other poems. ZAHEL BARNES GUSTAFSON. Boston: Lee & Shepard. New York: Charles T. Dillingham. Price, $1.50.

THE author has charmingly condensed the merits of an attractive romance in the agreeably measured poem, "Meg," the winning shapliness of which rhyme-clad story delightfully enlists the interest of the reader. The tribute to our lamented Bryant is artistically jewelled with poetic taste. "Not Peace, but a Sword," is written with some dramatic power. Altogether the chain with beautifully wrought links is richly chased with elegance of topography and binding.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

A FLOWER FOR THE DEAD.

BY JULIA C. R. DORR.

You placed this flower in her hand, you say!
This pure, pale rose in her hand of clay!
Methinks could she lift her sealed eyes
They would meet your own with a grieved surprise!

She has been your wife for many a year,
When clouds hung low and when skies were clear;
At your feet she laid her life's glad spring,
And her summer's glorious blossoming.

Her whole heart went with the hand you won;
If its warm love waned as the years went on,
If it chilled in the grasp of an icy spell,
What was the reason? I pray you tell.

You can not? I can; and beside her bier
My soul must speak and your soul must hear—
If she was not all that she might have been,
Hers was the sorrow, yours the sin.

Whose was the fault if she did not grow
Like a rose in the summer? Do you know?
Does a lily grow when its leaves are chilled?
Does it bloom when its root is winter killed?

For a little while, when you first were wed,
Your love was like sunshine round her shed,
Then a something crept between you two,
You led where she could not follow you.

With a man's firm tread you went and came;
You lived for wealth, for power, for fame;
Shut into her woman's work and ways,
She heard the nation chant your praise.

But ah! you had dropped her hand the while;
What time had you for a kiss, a smile?
You two, with the same roof overhead,
Were as far apart as the sundered dead.

You in your manhood's strength and prime;
She worn and failed before her time.
'Tis a common story. This rose, you say,
You laid in her pallid hand to-day?

When did you give her a flower before?
Ah, well! What matter when all is o'er?
Yet stay a moment; you'll wed again.
I mean no reproach; 'tis the way of men.

But I pray you, think, when some fairer face
Shines like a star from her wonted place,
That love will starve if it is not fed;
That true hearts pray for their daily bread.

[Sunday Afternoon.

LAMBREQUINS.

PANSY RAY.

IT is surprising now that lambrequins have become "the rage," the various shapes, sizes and materials we see them in, and the many different articles we find them adjusted to—windows, doors, mantels, tables, ottomans, brackets of all sizes—and yet, one can scarcely decide where the graceful drapery is most effective. I presume that the greater number of the women who read this have some chamber of their brain hung with idealistic lambrequins, which they have in vain essayed to bring before the admiring eyes of their lady friends. For your benefit I will give a few "hints" picked up by observation and experience, in the hope that they may aid you in bringing to light your preconceived ideas.

A pretty cheap window lambrequin to heighten the effect of unbleached curtains, was made in the following way, by a young lady who possessed a greater supply of contrivance than of blue delaine. There was a remnant of the delaine trimming, which, when cut in two, was only sufficient for a width of the goods to go perfectly plain across the window. However, nothing daunted, it was put up, and in the center three plaits made turning up, the plaits commencing at the lower edge; this made a point at each side but drew the lambrequin over so that quite a margin was left on each side; fortunately there was another remnant about six inches wide, which she had hitherto considered of no use, but which was now readily seized, cut in four pieces, for the sides of the two windows; the pieces then doubled together so as to form loops, a plait made in the top, and fastened on to the sides of the lambrequins at the top, the loops extending down to within a few inches of the points. Thus the pattern made from necessity became as pleasing as though cut after the most approved style. Where cretonne-stripes are used on curtains the lambrequins may be made of the same material, and are very beautiful; they could be made like those described above, without the loops at the side, if preferred, by making them wider across the bottom than top, that is, cutting them off sloping on the sides towards the top.

Two window curtains, of the latest pattern, with lambrequins to match, were noticed side by side in one of our large establishments a few days ago. The one of elegant maroon velvet, the curtain full at the top underneath the lambrequin, but the lambrequin plain, without a plait fastened on a rod by means of rings, and as straight across the bottom as the top, it being but a width of the velvet, the breadth of the window, without garniture of any kind. The other, a short distance away, was thought to be of the same expensive material, but on closer observation was found to be drab canton flannel. This curtain, about an inch from the front edge, was trimmed with a band of delicate pink canton flannel. The lambrequin was made similar to the velvet one, except it was hemmed across the bottom, and a band of the pink flannel set on above the hem to match the curtain. This curtain hung in as rich deep folds as the velvet one, and formed a striking but beautiful contrast to its companion.

A handsome mantel lambrequin may be made as follows: Take two pieces, say eighteen inches wide—they could be cut wider or narrower to suit your mantel—and fifty-five inches long, they should be of black satine or silk; satine if you wish to applique a design in cretonne embroidery, and silk if you want to paint on it, as the silk presents a much better surface on which to paint; these for the side pieces. Then cut a piece of crimson satine the length of the side pieces, and wide enough so that when they are sewed on, the lambrequin will be the width of your mantel. Where the black pieces are sewed to the crimson, cover the seams with herring-bone stitch in gold silk floss. In the center of the crimson piece, make three plaits turning up and fasten with silk cord and tassel. The effect of the mantel thus draped is very pleasing. One mode of embellishing lambrequins in general is to paint designs on cloth, cut them out and applique them on the lambrequins in medallions. White and gray storks are popular designs.

Another pretty mantel lambrequin, with the additional charm of being inexpensive, is of pink cambric covered with coarse, white swiss. Cut it out square in the center, eight inches or so from the shelf, and about the same distance across; then cut six inches down and six inches straight across toward the edge; then cut a scollop the same length down. Cut again straight across, make another scollop, and so continue until you reach the edge on either side. The straight edges are trimmed with cheap, fluted swiss, edged with lace, such as is often worn in dress necks; the scolloped edges are simply hemmed. Dark crimson roses with brown and green leaves are then cut out of cretonne, and basted in a graceful pattern over the entire lambrequin. A dressing-table, covered in like manner combined with it, gives warmth and tone to the room.

Bracket lambrequins can be made of almost any material, from handsome velvet painted in water colors, to those embroidered in Berlin wools on bed-ticking. For a pretty cheap corner lambrequin take three-quarters of a yard of Turkey red calico, blue delaine, or any other material you may prefer, gather in plaits at one end, fasten on the wrong side and sew on a tassel of Germantown wool. Let this come about mid-way below your bracket shelf, then let the cloth extend across the shelf, and up the corner of the wall any distance you like, having a box plait run up the center where it is tacked to the wall; at the top place a bunch of autumn leaves or Spanish moss, allowing the moss to trail gracefully down the sides. Some object to Spanish moss on account of its sombreness, but when used with discretion, and with here and there a tiny bunch of red berries or autumn leaves peeping out among the gray, it will have an effect quite the reverse of gloomy and must be classed by all as a fine decorator. When your statuettes or vases are dark they should be thrown out by covering the lambrequins with swiss, but Parian marble ornaments when placed on brackets draped as those described above seem warmed up.

Persian embroidery is beautiful for lambrequins as indeed it is for anything. Quite a pretty lambrequin was made of three pieces of opera flannel the edges notched, and in the center of each piece was a black velvet palm leaf embroidered in applique with oriental colored silk floss. A narrow band of white flannel followed the windings of the edge, put on with applique, with herring-bone-stitch worked through the center. Another, the center piece was of white opera flannel with a bunch of green velvet oak leaves in gold floss, appliqued above the leaves was a black velvet butterfly. The two side pieces were of black flannel, with a design in scarlet flannel appliqued on with gold floss. Around the edges and the shelf was a frill of the flannel scarlet and white cut bias, with the edges raveled and put on with herring-bone-stitch through the center. Ticking makes real pretty lambrequins, and of course cheap ones. The white strips are all worked in a variety of colors in zephyrs, and in different stitches as: chain, herring-bone, cat-stitch, etc., finished with a parti colored fringe of wools.

A BEAUTIFUL COLOR.

THERE is a proverb that "necessity is the mother of invention," and it has proved a true one in the method of producing one of the loveliest shades of a light brown, that I ever saw. We were tired of washing white worsted and woolen hose, and determined to make a change in the programme, so I took about four quarts of butter-nut shucks (that is, after the nuts were cracked I took the shells, with the bark on them), and put them into an iron kettle, poured on a pailful of soft water and boiled them three-quarters of an hour. I then strained out all the shucks, put the liquid on the stove, and went to get a piece of copperas to dissolve so as to set the color. But I found there was none to be obtained short of four miles' travel, so I dissolved a tablespoonful of saleratus, and poured into the kettle of dye. I then washed the hose in warm soapsuds, wrung and put them into the dye. I stirred them frequently, then took them out, cooled, wrung, and hung them up to dry. The next day, I washed them thoroughly in hot soapsuds, and they are certainly the prettiest shade of light-brown I ever saw, and they grow brighter each time they are washed. I have tried the dye twice since with the same result. It colors cotton beautifully, and its great beauty is its durability. It would make a beautiful shade for a carpet, and it does not spot. Had I been able to obtain the copperas, I would have had a very dark-brown color; that was what I expected, when I commenced the operation. With the aid of saleratus the result was an entirely new color that is just as durable, and far prettier than the dark-brown. I clocked some of the hose with blue, and some with magenta worsted, and they are very handsome. I have often wondered if many of our household recipes were not the result of necessity or accident. Housekeepers have the opportunity of trying innumerable experiments, and it is very pleasant to have the result a success. When we cannot obtain what we wish, it is very nice to have a substitute that we can use, that will answer our purpose just as well, and prove more satisfactory. Once when I was coloring with anatto, I had no soda to set the color, and instead, took some lye, and found it so much superior that I have used it ever since in coloring. FARMER'S WIFE.

HER MAJESTY'S SHIP PINAFORE.

"AND do you really think that we could give a representation of this opera, in our dead-and-alive village?" So writes a young correspondent.

There seems to me no reason why the young folks, in any village, may not amuse themselves by rehearsing and giving *Pinafore*. The music, though bright and pretty, is by no means difficult and one "who can carry a tune" ought to be able to sing the score correctly after a little practice.

The costumes are simple, and there is but one scene, which represents the deck of the *Pinafore*. As the ship is supposed to be at anchor, instead of a boundless expanse of the deep, blue sea, at the back, there should be a view of a town in the distance. At the back of the stage runs the bulwark of the ship; at one side is the captain's cabin, a small house. Flags and sails can be arranged so as to relieve any bareness.

The crew are attired in plain sailor costume, and the sisters and the aunts and the cousins can wear yachting suits; but this is a matter in which they can exercise their own taste. Some of the costumes produced in N. Y. theaters have been marvelous. One worn by a female relative of Sir Joseph Porter's lives in my memory. She reminded me of that "creature in pink with a mother in green," with whom David Copperfield flirted so desperately. A muslin or lawn dress, a fancy garden hat, and long, lisle thread gloves, is an appropriate costume. Cousin Hebe can be arrayed more showily. One costume serves throughout the opera for the sisters, aunts and cousins. Josephine wears a walking costume in the first act, and a bridal one in the second act. Buttercup should be made to look fat, rosy, and forty, and have a peddler's basket on her arm. Sir Joseph Porter should be dressed in full court costume, and Capt. Corcoran in a captain's uniform. There is little "acting" to be done. The whole affair is farcical in the extreme, and any attempt to be *funny*, quite spoils the effect. A certain jollity of manner and roguishness of expression are all that are required. I know whereof I affirm when I say that an effort to be comic will fail of its object, for I saw the opera burlesqued by a minstrel troupe, and about the only amusing feature in it was not intended to be funny. That was, the inability of the "minstrel" who played Ralph Rackstraw to sing his part. One of the crew had to step to the front and do Ralph's singing. Trouble was Ralph was a baritone, and the music is written for a tenor. For the rest the burlesque was poor, and at times coarse.

One dollar will buy Oliver Ditson & Co.'s (of Boston) admirable book of the opera. It contains the *full* opera, songs, concerted pieces, piano accompaniment and the words that are spoken, all properly arranged.

I shall be most happy to answer any other "Pinafore" questions, that the young folks may feel disposed to ask. FAITH RIPLEY.

LET WOMEN HELP WOMEN.

EDITORS JOURNAL:—Women do too much for men and not enough for their own sex. Ladies of means who make bequests usually give their propty to men. Poor young men have education societies to help them along. Why cannot we have an education society for poor young women who are thirsting for knowledge, but have not the means to obtain it? Will not some of our benevolent ladies start one? I will promise to make myself a life member, if it does not exceed thirty dollars to do so.

There are many men, called respectable, who employ poor women and take advantage of their poverty.

Oh, how base! Let us all, dear ladies, who have means, do more for our own sex, and less for the men. Let the men take care of themselves for the present. They will not give us our rights. If we should lay down our lives for them, as many women have already done and will, no doubt, continue to do.

Three men who live in Boston have lately asked me to help them. One wanted me to help him get his poetry put into a book; the other two had some pamphlets to be printed. I was so hard-hearted that I did not help either of them. Many men think women were made to do for them. We had far better take care of our own sex, get our education society going to aid poor girls, and institutions to afford a refuge from the intrigues of men. To parents in the country I say, keep your boys and girls at home; this general rush to the city for employment, which has been going on for years past, is to be deplored. You had far better bring them up as parents used to, forty years ago, with good principles and some knowledge of getting an honest living.—*Mrs. Tiffany in Woman's Journal.*

FELONS.

FELONS are usually caused by a bruise which loosens the flesh from the bone, and then the part becomes the seat of a gathering, and is sometimes very painful. Sometimes felons last a long time and have to be lanced, causing terrible pain; but if taken as soon as they can be determined to be felons, they may be cured. The remedy to be applied is a soap poultice. Put some soft soap over the fire in a small dish; when it boils thicken with bread crumbs and apply as warm as you can bear it. Two or three applications usually effect a cure; but if it is obstinate, continue the remedy until a cure is made. When quite painful, this poultice will usually ease the felon in a few moments. On removing the poultice, if a drop of water appears above a tiny orifice in the sore, the felon is removed and no further trouble need be taken about it. LORETTA E. TURNER.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

LOG-CABIN SKETCHES; OR, JESSIE SEABRIGHT'S DIARY.—No. 6.

MAY MAPLE.

A Home-made "What-not."

MAY 16th—18th. A house without ornamentation is scarcely a home, but adornments must not be too numerous in a small log cabin, lest they become a nuisance. Our books, which kind friends sent us, and papers, of which we had no lack, were getting, not too plentiful for our enjoyment, but too abundant for our small table, as they had to be moved from that to a chair, or perchance the floor, whenever the table was needed for breakfast, dinner or tea. So I determined to have a corner "what-not" that should be ornamental as well as useful. But the next thing was to find the materials, at least the lumber. After searching house and barn, and finding nothing that would possibly answer my purpose, I came to the conclusion that I should be obliged to do without the much-desired piece of furniture.

My old motto, "where there's a will there's a way," seemed to be at fault this time. I sat down by the south window, which commanded a view of my flower garden, which had been only recently laid out and, as yet, was merely a promise of future pleasure, to get over my disappointment; when suddenly I heard the thud of horses' feet and the rumbling, rattling sound of wagon wheels, approaching the house, and looking up I saw the pleasant faces of Mr. and Mrs. White. Instantly my vexation vanished, for these friends were always welcome guests.

After assisting his wife out of the wagon, Mr. White took out a square wooden box, and brought it to the door saying:

"Here's a box o'traps Louise has packed in for you; I don't know what it all may be, but I hope you won't find any of the young ones, for we haven't any to spare." And away he went to meet John, who had just come from the field. As soon as we were alone, and the usual compliments of the day were passed, Mrs White said:

"Our folks, have just sent us a barrel of dried fruit, from Ohio, and I thought probably your supplies might be getting low, and so I brought you a little package of each kind. And in the bottom of the box are some old clothes that I thought would do for carpet rags—but if you haven't got your carpet all made and down! Well, well! you deserve to prosper; and surely your ingenuity and industry will bring you a fortune."

After looking over all the packages and nearly emptying the box, I very demurely inquired if she wanted to take it back.

"Oh, no! I selected a good-sized box, on purpose for you, because I knew you had a perfect mania for old boxes. But won't you tell me what vision of convenience is haunting your dreams?"

After thanking my generous friend for her favors, I told her of my morning's vexation.

"Well," said she, "this afternoon the men are going to the Corners, to attend a business meeting, and if you will make your stand so thas I can see what it is like; perhaps I can have one too."

How we visited while we cleaned sauce and set the table for dinner. I say *we*, for Mrs. White and I work together, no matter which chances to be the guest, and that is the way with most pioneer friends. There is but very little folding of the hands or putting on ostentatious airs. In most cases there is no "best room," in which to shut up one's friends while the matron prepares the frugal meal; so they come into closer communion with one another, better understand the necessities of their friends, and thus learn to be more charitable.

After our dinner service was cleared away, I told Bertie he might hunt up all his long strings of spools, that had been given him to play with, and we would see how pretty we could make them look in something useful. Then some coarse wire that had come around bales, was brought and measured off in three pieces of suitable length, and what was to be the lower end of each wire was given a square bend, making a little foot about half an inch long. Six three-cornered shelves of graded sizes were sawed out, and holes bored in each corner with a good-sized gimlet—and the hardest part of the work was done. Three large spools of the same size were strung upon each wire, and then the largest shelf. Then followed eight spools for each wire, and another shelf; and soon, graduating shelves and spools until the last shelf was placed, which was only large enough to hold a small vase of flowers, and three tiny spools finished the top of each wire. After slightly bending the front wires toward the back, leaving the latter straight, the "machine" stood up boldly and in fair proportions. Some gum-shellac dissolved in alcohol made a very good varnish, with which we soon had it shining. To hide the edges, I tacked on around each shelf some brown fringe, that had done duty for dress-trimming, and the really pretty piece of furniture was ready to be placed in its appointed corner. The work had occupied a good part of two hours, and yet not one bit of our visit had been spoiled. Very soon books and papers found a convenient and appropriate place, as also did many curious "specimens" that Bertie and I had gathered in our woodland rambles, and a few holiday gifts added much to the beauty of our "what-not."

When we had it all arranged satisfactorily, Mrs. White said: "I'll hunt up all the materials, and the next time you come to our place we'll have another such a visit, for I have enjoyed this immensely.

DOMESTIC RECIPES.

Plain Puddings and Cakes—Tapioca Pudding without Eggs or Milk.

Put one teacup of tapioca and half a teaspoon of salt into a pint and a half of warm water. Keep them on the back of the stove for four hours, where they will be warm, but do not cook. Pare and core six apples and place in a deep pudding dish. Sprinkle sugar and grated nutmeg over the apples; add one teacup of water; bake until the fruit is soft, but not broken. When the tapioca is sufficiently soaked, turn it over the apples and bake one hour. To be eaten with a sauce made according to the following: One-half teacup of butter and one-half teacup of sugar stirred until smooth; set the dish in a pan of hot water; add a large spoonful of hot water to the butter and sugar, and stir until the sauce is like foam.

Rice Pudding without Eggs.

A little less than one teacup of rice in one quart of rich milk. Add one teacup of sugar; one-half teaspoon of salt and a little grated nutmeg. Bake two hours, or until the rice is soft. The pudding should be stirred frequently while boiling to prevent the top from burning. More milk can be added if the pudding seems too dry while baking. Best eaten cold. No sauce required.

Bread Pudding.

Place slices of buttered bread in a deep pudding dish. Cover the bread with thin slices of tart apples; then put on another layer of bread and apples, and continue thus until the dish is full. The top layer must be bread and butter, with the buttered side down. Pour milk over the whole until thoroughly moistened. Cover the pudding dish with a plate and bake two hours. Take off the plate, sprinkle the pudding with any spice liked, and bake another hour, or until brown on top and the apples soft.

Sauce—Make a [illegible] paste with two spoonfuls of flour, a [illegible] it into a half pint of boiling water. Stir until the flour is well cooked, make the sauce very sweet and let it boil up once. Take it off the stove and add a tablespoonful of strong vinegar or lemon juice and a piece of butter the size of an egg. If too thick, more water may be added.

[illegible]hite Cake.

Two cups of sugar; one-half cup of butter; the whites of four eggs; a little less than one cup of sweet milk; three cups of flour; three teaspoons of baking powder, sifted with the flour. To make: Stir the butter and sugar together until light, then stir in the milk, then the flour, mix thoroughly and add the beaten whites just as the cake is to be put into the oven. Flavor, if liked.

Golden Layer Cake.

One and one-half cups of sugar; one-half cup butter; one-half cup sweet milk; one egg and yelks of four. Two cups flour in which two teaspoons of baking powder have been stirred. Bake in five cakes, and spread with jelly to which the juice and grated rind of a lemon have been added. Keep the cake closely covered with a tin pan or several folds of cloth until wanted. Either of these cakes is fine, with canned fruits, for dessert.

Lyons, Iowa. MRS. M. G. R.

Best Cake.

One pound of sugar; six eggs; one cup of butter; one cup of milk; four cups of flour; one large teaspoonful of soda and two of cream-of-tartar.

Black Cake.

Twelve eggs; one pound of butter; one pound of sugar; three pounds of currants, two pounds of raisins; one tablespoonful of cloves, and flour to make quite stiff. Put the fruit in last.

Small Sponge Cakes.

Beat two eggs well, then stir in one teacup powdered sugar, beat five minutes and add one cup of flour. Bake in small cakes.

Crullers.

One and one-half cup of sugar; two eggs; one spoonful of butter; one cup of sweet milk; one teaspoonful of cream-of-tartar; one-half teaspoonful of soda.

A Tea Dish.

A nice dish for tea is made by putting six or eight butter crackers in a dish, pour boiling water over them and grate loaf sugar and nutmeg or lemon over, and lay on slices of jelly. Pour enough sweet cream over them to make a nice sauce.

Mock Mince Pie.

One cup chopped raisins; one nutmeg; one cup of water; one tablespoonful of cinnamon; two cups of sugar; one-half cup of vinegar; one cup of sweet boiled cider; butter the size of an egg and eight crackers rolled fine. Cook well together.

Jumbles.

One-half pound of butter; three-fourths of a pound of flour; three-fourths of a cup of white sugar and two eggs well beaten. Add a little nutmeg, make into a soft dough. Break off in small pieces, roll in sugar and bake in rings.

Ginger Snaps.

One pint of molasses; one cup of butter; one teaspoonful of ginger; one teaspoonful of cloves and one of soda. Put all together on the stove, let it come to a boil, and when scarcely cool add flour sufficient to roll out.

LORETTA E. KNAPP TURNER.

QUESTIONS ANSWERED.

Vinegar Pie.

C. T. Gaylord wishes a receipe for *old-fashioned* vinegar pie.

ANS.—We append two receipes trusting that one or the other upon trial will prove to be the one you are in search of: No. 1. One large-sized cup of sugar; one cup of vinegar not too strong; a heaping tablespoonful of flour and a little lemon peel. Bake with two crusts. No. 2. One teacupful of sugar, one egg and one heaping tablespoonful of flour beaten well together; then add two tablespoonfuls of sharp vinegar and a scant teacupful of cold water. Flavor with nutmeg, if liked, and bake with two crusts.

Black and Violet Ink.

C. T., Millersville, Ohio, asks for a receipe for making black and violet ink that will last a good while.

ANS.—*For Black:* To one quart of clean soft water add four ounces of Aleppo galls well bruised; bottle, cork tight and let macerate for ten days, shaking the liquid each day. Then add one and one-fourth ounce of gum-arabic dissolved in a wine-glassful of water; one-half ounce of lump sugar; mix well and further add one and one-half ounce of sulphate of iron (green copperas) crushed fine. Agitate occasionally for two or three days, when the ink may be used; but it will be much better if left to digest from one to two weeks before it is decanted. This makes one quart of good ink, writing pale at first but soon turning very black. The addition of a few bruised cloves or a little oil of cloves will prevent any tendency to moldiness in the ink.

For Violet: We gave in the RURAL of Nov. 9, 1878, the best recipe we know of for this ink and will again publish it: Mix one drachm of the desired aniline color with one and a half ounce of alcohol in a glass bottle; let it stand three or four hours and then add thirteen ounces of distilled or filtered water. Subject to a gentle heat until no odor of alcohol is perceptible, after which add four drachms of gum-arabic dissolved in three ounces of water. Mix and strain.

Barley Coffee.

Mrs. M. G. L., asks for a recipe for barley coffee.

ANS.—Wash the barley, dry it and brown carefully without burning. Grind, mix with an egg and pour over boiling water. Boil gently for a few minutes and strain. Drink with milk and sugar or as best liked.

S. B. Philson: the recipe for coloring blue on cotton was given in RURAL of Feb. 8, page 97.

News of the Week.

MISCELLANEOUS.

Monday, May 19, 1879.

The prevalence of pleuro-pneumonia among the cattle of Greenwich, Conn., reported by Prof. Cressy and two Connecticut experts, while not very alarming, should lead to a careful watch over the health of neat animals and every precaution against the spread of the disease. Secretary Sherman transmitted to the House Tuesday recommendations submitted by the commissioner of internal revenue and a detailed report of the operations of his bureau in the suppression of illicit distillation of liquors. Since July, 1876, 2638 stills have been seized, 5422 persons arrested, $109,135 expended for special deputies, 19 persons killed and 35 wounded. The operations have been principally in Georgia, Alabama, Tennessee, Kentucky, South Carolina, North Carolina and Virginia, in which seven States the seizures numbered 2283 and the arrests 4915. The nine Northwestern States cast 1,800,000 votes in 1874, 2,400,000 in 1876, and they will probably cast 3,000,000 in 1880; if population grows in the same proportion, these nine States, whose territory came into the Union with Virginia and Louisiana, will have at the next apportionment more votes in the House than all the South put together, solid or not. A purse trotted for is gambling, under the laws of Pennsylvania. The winner cannot recover the premium, purse, stakes or prize unless the company chooses to pay him. The horse of each contestant is forfeited, the whole arrangement being a palpable evasion of the law. Eleven cheese factories have been built at Sheiboygan, Wisconsin, during the past winter. It is estimated that six million pounds of cheese will be made during the present season. A correspondent in Walterborough, S. C., describing the recent cyclone there, cited as a remarkable occurrence, that "a sheep was found lying in the road with every particle of wool taken from it as cleanly as a razor could have done it."

Gen. Sherman has received advices from Gen. Sheridan to the effect that everything in the West is in good order, and that there is no danger of any troubles. The Indian Territory is well in hand, and the Indians of the North-west, who are the most turbulent, show no signs of restlessness. There are reports of some stealing by Indians on the Yellowstone, but the thieves are thought to be reservation Indians. Gen. Sherman says military affairs were never so well arranged in the West as now. Gen. Sheridan has reduced everything to an admirable and effective system. There is great anxiety among cattle owners in Bridgehampton, L. I., in consequence of the discovery, through official investigation, that pleuro-pneumonia prevails there to a much greater extent than had been supposed. Prof. Law and Dr. McLean have examined several herds, and found the disease in its worst type, as proved by the condition of the lungs of a number of cattle after they had been slaughtered. The disease is supposed to have been propagated by a drove of cattle driven into the Hampton by Isaac Bullard last December, a hundred or more of them having been sold by him. During April vessels arrived at New York from foreign ports almost at the rate of one every hour, the whole number being 714. Of these there were 259 American, 227 British, 68 Italian, 66 Norwegian, 34 German, and 21 Austrian. Of the whole number 132 were steamships, and over 85 of these the British flag floated. The American steamers numbered only 20 The arrivals of coastwise vessels numbered 1,245, giving a grand total of 1,959—a goodly number of ships to sail into one port in the space of 30 days.

Both branches of the New York Legislature have passed a tenement house act intended to prevent overcrowding and insure ventilation. The bill forbids any tenement house which may hereafter be built from occupying more than 65 per cent of the lot on which it stands, and a clear space between it and the building next to it must be left, varying with the hight of the tenement-house. The windows in every room must equal in size one-tenth of it superficial area, and each room must communicate by a window, air-shaft or ventilator with the open air. Overcrowding is prevented by requiring an allowance of 600 cubic feet of air to each occupant. A society already organized in this city stands ready to see to the enforcement of these provisions, whose violation by any owner or agent is made a misdemeanor. The spring drought extending throughout the Eastern States has been the occasion of many forest fires and much consequent damage. About 7000 acres have been burned on the Catskill Mountains near Rondout. Pike, Schuylkill and Berks counties, Pennsylvania, have also suffered. About 1000 acres have been burned over on "the Dome," a mountain north of Williamstown, Mass, while Pelham and Dedham also lose by forest fires.

The report of the Department of Agriculture on the morning of the 17th inst., contains the following: "The acreage of winter wheat now growing is about 1¾ per cent. greater than last year. In the Southwest the area has been reduced since sowing. The Atlantic coast States from Maine to Georgia as a whole show a declining area. Of the Southern States only Mississippi reports a diminished area. Of the Northern and Western States, Michigan, Minnesota and Kansas fall off from last year. The other great wheat-growing States show an increase. California is not included in the estimates of winter wheat area. The crop of the country taken as a whole presents a promise of at least two per cent. below the average. The New England States reach a full average. The rye crop, taken as a whole, is four per cent. below the average. It is about the average in New England and in nearly all the West and Northwest. The condition of sheep throughout the country is very good."

The endowment fund of $250,000 for the Drew Theological Seminary, which was swept away by Daniel Drew's failure, has been replaced by new subscriptions aggregating $248,000. It is proposed to raise in all $300,000.

Five steamships, four British and one German, carrying freight, which sailed from the United States last winter, and one which sailed from England, are missing; also, ten sailing vessels, grain laden.

FOREIGN.

Several conflagrations, attributed to Nihilists, have lately occurred in east Russia towns, causing great distress. Seventy arrests have been made in Orenburg on the charge of incendiarism. Four male and six female prisoners are now undergoing court martial at Kieff, including three Russian noblemen, a Prussian subject, and the daughter of a privy councellor. Among the other arrests are a titled lady and a leading Nihilist. The streets of Kieff, near the court house, are to be closed during the trial. Another incendiary fire occurred at Irbit on the 13th inst., by which four of the poorer quarters were destroyed.

The governor of Orenburg, has telegraphed that another fire occurred in that city on the 8th inst., which was quickly extinguished. Another fire also broke out in the Cossack quarter, which was about half consumed thereby. The governor of Uralsk, in the same government of Orenburg, telegraphs on the 11th inst. as follows: "A fire here has destroyed a considerable portion of the town and is still raging."

Queen Victoria of England, who has returned home from her continental trip, is a great-grandmother. A daughter was born Monday to Princess

Charlotte of Prussia, wife of Prince Bernhard of Saxe-Meiningen and daughter of the crown prince of Germany.

The season is as backward across the ocean as here, and threatens to spoil the fruit and injure cereals in Great Britain, and has kept back the mulberry leaves on the Continent, on which the silk-worm feeds, so that there is a prospect of a diminished silk manufacture.

John Henry Newman has at last formally received the cardinal's hat, the Pope in bestowing it expressing in strong terms his sense of the service he was rendering to the Church, to society, and to the College. The fact is that Newman is not only perhaps the most distinguished Englishmen of his time—that is, the Englishmen whom all other Englishmen most delight to honor—but the most serviceable Catholic the Church has had to show within the present century. That he should have been forty years in her ranks without receiving any signal mark of favor is a curious illustration of the nature of the Papal regime since 1848. No one has done so much to make Catholicism attractive, and no one, we might add, of modern theologians has done so much to make faith and devotion respected by the sceptical. Not the least powerful of the instruments by which he has charmed two generations of his countrymen is his English style, which in simplicity, purity, clearness, and grace may fairly be called matchless.

It was announced in the German Reichstag, Wednesday, that Austria and Russia had consented to become parties to the Anglo-German treaty for the prevention of the slave trade on the African coast, but France and the United States, though asked to do so, were hardly expected to join, as they were unwilling to admit the mutual right of search.

Floods have destroyed 300 houses in Kottori, Hungary. The harvest prospect in that district are ruined.

An order requiring all swine from the United States to be slaughtered at the port of landing in Great Britain takes effect the 16th of May.

The situation in India does not improve. Anxiety has existed for a long time because of drought in the Punjaub, Oude, and the Northwest provinces; and although rain has fallen, uneasiness has not been completely allayed. Of late serious apprehensions have been excited regarding the crops in Lower Provinces; and in a portion of the Eastern Deccan, not yet recovered from the late famine, excessive and unseasonable rains first, and a plague of rats next, have destroyed the local harvests. Under these circumstances there is need for the most rigorous economy. Orders have been issued cutting down expenditure on public works, and forbidding the undertaking even of works already authorized, without special instructions.

Murray & Lanman's Florida Water.—We earnestly urge every purchaser to ask for that which is prepared by Messrs. Lanman & Kemp, New York, who are the sole proprietors of the true perfume. All other so-called Florida Waters are only ordinary Colognes.

For close confinement, want of air, sedentary habits and brain and nerve-tire, trust in Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 17th, 1879.

BEANS AND PEAS.—There is no marked change in the bean market. Marrows have as good an export outlet as can be expected in spring. Mediums steady with small sales. White kidney and pea beans in their old rut of inactivity. Red kidneys quiet; for parcels in export order, 6@10c, to be added. Considerable red are to come, but it is thought they will all be used. Turtle soup beans slow. Green peas quiet but firmly held at $1.80. So. B. E. peas nominal at $2.50 per 2 bush. bag. Canada field, in bulk and bond, also 75c. Medium beans, prime, $1.30@1.32½; other, $1.20@1.25; marrow, prime, $1.37½; other $1.25@1.35; peas, $1.20@1.35; W. kidney, $1.20@1.40; R. kidney, $2.85@3; black, $2.10@2.15.

Receipts for week, 5,512 bush. beans.

Exports, 1,161 pkgs.

BEESWAX.—The movement has been light; sales at 24@25c. for Western and Southern.

BROOM CORN.—Offerings of brush are small and fully prices made; otherwise dealings are light.

Brush and short broom, choice, per lb., 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 2@3½c.; red and crooked, 2@3c.

BUTTER.—Light supplies, especially of Western have kept up a steady tone, and prices, though no higher, have been paid less reluctantly than is usual when the market is on this end of white. A good point of the situation this spring is the possible relief that will be felt by absence of light surplus of hay-butter. The easy figures that seem settled will encourage trade for consumption and export when rich flavored and *naturally* colored grass qualities appear in stock. Fine dairy pails at the moment take the precedence of creamery; there is not the additional 3c. worth of excellence in grades of the latter at this season. One or two sudden hot days during the week have depreciated the value of long-shipped parcels. It is fortunate that that particular time supplies were not heavy. Exporters have used up about 5,000 pkgs., taking high grades of State and Western when they could get them and paying full. Quotations

NEW BUTTER.—State pails and half tubs, choice, 16@17c.; good to prime 14@15c.; fair to good, 12@14c.; Welsh tubs, choice, 15@16c.; good to prime, 14@15c.; fair to good, 12@14c.; State tubs, poor, 8@10c.; State creamery, best invoices, 17c.; good to prime, 17@18c, sweet cream, best, 17@17½c.; fair to good, 15@17c; Western creamery, best invoices, 19@20c, good to prime, 17@18c.; fair to good, 15@17c; imitation creamery, 14@16c.; Western, dairy, best invoices, 14@15c.; good to prime, 11@13c; fair to good, 10@11c.; poor to fair, 6@10c.; factory, best invoices, 13 14c; good to prime, 10@12c.; fair to good, 7@9c. Old ranges 7@12c. for State; and 5@8c. for Western; grease, 3@4c.

CHEESE.—The exports for the week have been 29,166 boxes. The market early in the week, on the receipt of advices from the country sales, went up about ½c, with 7¾c. reached for the choicest, and and an occasional lot going at 7¾c. These figures have been fairly well held through the week, although there has been the feeling to put out the receipts as promptly as possible, on account of the possible effects of the warmer weather on the early make lots. The market closed, showing the increased supplies pretty well sold up, and promises to be in good position to receive the larger amounts which are looked for the coming week.

Quotations are 7@7½c. for best; 6@6½c. for good; 3½@5½c for half skimmed, and 2@3½c. for skimmed; western factory at 6½@7c. for fine; 3½@5c. for half skimmed, and 2@3c. for skimmed, and for old as follows: 7½@8c. for fine lots; 6@7c. for good; 5@6c. for fair; 2@3c. for skimmed; 3@5. for half skimmed; Western factory, fine, 7@7½c.; good and prime, 5@6½c.; do. full skimmed, 2@3c.; do. half skimmed at 3@4½c.

COTTON.—Has continued on the upward turn, and has been active, leaving off strong at for May, 12.81@12.83c.; June, 12.89c.; July, 13.06c.; August, 13.18@13.19c.; September, 12.85@12.89c; October, 12@12.01c.; November, 11.55@11.56c.; December, 11.45@11.46c.; January, 11.48@11.49c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

DRIED FRUITS.—Trade drags as usual at this period of the year, no export demand of movement and otherwise all ek operations; prices are in most cases rather nominal.

Apples—evaporated Alden's & William's 10@10½c.; do. new process at 8@8½c. State plums, 12@12½c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., 8@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for Southern quarters in bags; 3½@4c. for prime sliced; do., fair and good, 3@3½c.; State at 3@4c. for new sliced; and 5@6c. for quarters; Western at 3@4c. for new quarters. Raspberries, 30c.

EGGS.—Receipts for week, 13,261 bbls.; do. last week, 14,753 do. Cheap fish, including shad, and a variety of green stuff in market give eggs a second rate position and prices are low. Western begin to lose in count, owing to west eggs and warm transportation. Canadian eggs scarce, and likely to be while our low figures prevail.

Near points, dozen, 12½c., State and Penn., 11½@12c.; Western, choice, 11½c.; Southern, and poor Western, 10@11c.

FLOUR.—The market advanced further immediately subsequent to our last, but for a day or two has been weak and lower on a decline in wheat.

Latest sales are at $3.40@3.90 for inferior to very choice superfine state; $3.75@4.00 for poor to good extra do., odd lots and lines; $4.00@4.35 for good to choice do.; $3.35@3.90 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.70@4.00 for inferior to good shipping extra do., and $4.00@4.35 for good to choice extra do.; common to about choice white wheat extras, $4.35@5.45, choice to fancy do at $5.50@6.50; red and amber winter wheat, inferior to very choice trade and family, at $4.35@6.25; round hoop Ohio at $4.00@4.40, and trade and family brands of do. at $4.50@6.35, the latter rate for at lofty fancy; St. Louis, $4.40@5.50 for inferior to good extra; $5.10@6.35 for good to very choice (with a few very fancy brands up to $6.75); Minnesota clear, very inferior to very choice, at $4.70@4.8; Minnesota "straight," very inferior to strictly choice at $4.35@5.85; and very fancy as high as $6@6.25 asked, and patent poor to at lofty fancy at $5.40@5.75, few brands going above $5.50@7.65 unsound wheats at from $2.25@5.75, city mills extra at $4.90@5.25 for West Indies (the latter rate for fancy in new packages); do. for England and $3.70@4.00, do. trade and family extras, $5.25@6.25; do. for South America, $5.50@6 for fair to very choice; No. 2 at $2.50@3.50 for poor to strictly fancy.

FRESH FRUITS.—Apples are falling into a chance trade. Exportation has stopped and local wants are limited. Russets form the chief offering. Prime Baldwins, Russets and New Spy, $2@2.50; common and shaking stock, $1@1.75. Cranberries have a small jobbing call. Strawberries in better supply. Nearer gardens begin to supply. Virginia has opened with small lots. N. C., 20@25c. quart; choice Norfolk 20@22c., common, 12@18c. Hot-house grapes, Hamburg, $1@1.50 lb. Peanuts firm, most sales for other points. Va. hand-picked, $1.35@1.40; other, $1@1.25; shelled, 5½@5½c.; Pecans, 6@8c.

GRAIN.—Wheat has shown for a day or two a subsidence of the speculative activity, and the market has dropped 2@3c. from the best figures of the week. Latest sales are of No. 3 spring at 94c.; ungraded amber at $1.14@1.15; ungraded red at $1.13@1.17½; No. 2 red at $1.16@1.17½; ungraded white at $1.14@1.15½; white State, very poor, at $1.07; No. 1 white at $1.14½@1.15½; No. 2 white at $1.13; New York No. 2 spring, May option, at $1.06½; do., June, at $1.05@1.05½; No. 2 Northwest spring, June, at $1.16; No. 2 red, May, at $1.17@1.17½; do., June, $1.16@1.17½; No. 1 white, May, at $1.14½; do., June, at $1.14@1.14½ do., July, at $1.13½. Rye at 60@65c. for Western and 62@64c. for State. Corn closed strong and active, with sales of New York No. 1 at 45½@46c.; New York No. 2 at 45½@46c.; New York steamer mixed at 45c.; No. 3 at 44@44½c.; ungraded Western mixed at 43@44½c.; New York No. 2 white quoted at 52@53c.; New York steamer white at 47@47½c; round yellow at 48@49c.; low mixed at 46c; New York, No. 2, May, at 44½@44¾c.; do., June, at 41@41½c.; do., July, at 45½c.; do., August, at 46½c.; New York steamer mixed, May, at 44c.; do., June, at 42½c. Oats are having a good inquiry and prices higher. Sales of New York No. 1 white at 41c.; New York No. 2 white at 38½@39c; New York No. 3 white, 37½c.; New York No. 3 at 31½@32c; white Western at 37½@39c.; mixed do. at 34@35½c.; white State, 40c.; No. 2 Chicago in store at 31@34½c.

HAY AND STRAW.—Receipts have been small, demand good, and prices higher.

Sales at 45@55c. for shipping, and 70@90c. for retail qualities. Straw at 45@50c. for long rye; 40c. for short rye, and oat at 30@40c.

HOPS.—The warm weather of the last few days has had a beneficial effect upon the hop trade, especially on the demand, which has been considerably augmented. The price, however, shows no change, the range still being between 5c. and 12c. ₱ lb., the latter figure being almost entirely nominal. Exports for the week, 307 bales.

Quotations are New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@12.

MAPLE SUGAR.—Supply has been used up better this season. Prices low; 7@9c. cakes; 75c. strup in tin.

OIL-CAKE.—Is wanted, and is strong at $27.50@28 per ton.

POULTRY AND GAME.—Most country-dressed turkeys run large and are slow of sale. Spring chickens lower, shipments of dressed poultry should hereafter be de-iced.

Turkeys, State and Western prime small, 16@18c.; fair to good, large, 13@14c; Phila., dry-picked 12@18c. Spring chickens, do., 35@40c.; winter, broilers, dry-picked, 25@30c. Fowls, Jersey, choice, ₱ lb., 14@15c., State and Western, prime, 13@14c.; fair to good, 11@13c.; Phila., dry-picked, 14@16c. Capons, large and choice, 30c.; small, 25@26c. Slips, ₱ lb., 22@25c. Ducks, Jersey, 18@19c; State and Western, 17@18c.

Live fowls active and firm. Hurry to realize on small chickens is a mistake.

Spring chicks, 50c.@$1.12 ₱ pair. Fowls, Jersey, per lb., 13c.; Western, 12½c.; Southern, 12c; roosters, old, 6@7c. Turkeys, Western, 11@13c. Ducks, L. I., N. Y. & Pa., ₱ pair, 65@75c.; Western and Southern, 55@65c. Geese, Jersey, ₱ pair, $1.50@1.75; N. Y. & Pa., $1.25@1.50; Western, 75c.@$1; Southern, 75@78c. Pigeons, 40@50c.

In game pigeons form the chief supply; baited, ₱ doz., 12; trapped, $1.25@1.75; shot, 40c@$1. Ice-house English snipe, $2.25@2.50; plover, $1.75@2; Dowitch, $1.50; sand and small, 40@50c.; tame squab, $3.25@3.50.

PROVISIONS—Have been less active and unsettled in price. Mess pork closed for May at $10 to bid and $10 10 asked; June, $10 10; July at $10 10 bid and $10 20 asked, and August at $10 20. Bacon at $4 95 for long clear and 5½ for short clear. Lard—Western steam, at $6 40 for shot lots; $6 37½ for May and June; $6 42½ for July, and $6 45 for August. Stearine at 6¾@6¾c. for Western and 7c. for city. Tallow at 6¼c for prime. Beef hams at $18 00. Beef—Extra India mess, $21@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEEDS.—Grass are dull; clover quoted at 6¼@6½c. for prime and choice; timothy at $1.00@1.35.

TOBACCO—Has shown a very slow export movement, but the home demand has been good; prices generally are very steady.

VEGETABLES.—Sound prime old are steadier, as no late supplies have been added to the stock. New Southern are gaining a place. Asparagus lower. Florida tomatoes, $6 crate, made good. Green peas are in large supply and low in price. Stiff prices for extreme Southern produce can hardly rule long, as nearby States will soon be preferred competitors. Bermuda, new, choice, per bbl., $6.00@6.50; Charleston and Savannah, new, choice, $4.50@5.50; Florida, new, choice, $4.50@5.50; culls, $2.00@3.00; early rose, N. S. and Eastern, per 4-h bbl., $3.00@3.75; State, choice, per 4-h bbl., $3.00@3.25; State, poor to fair, per bbl., $2.50@2.75; Western, per 4-h bbl., $2.75 3.25; do., bulk, per 180 lbs., $2.50@3.00; peachblow, Western, per 4-h bbl., $3.00@3.37; State, per bbl., $3.00@3.37; Prolific, choice, per 4-h bbl., $2 75@3 25; peerless, State, per 4-h bbl., $2.62@2.87; do., in bulk, per 180 lbs., $2.50@2.75; Jackson white, per 4-h bbl., $2.75@3.00; sweet potatoes, Del., per bbl., $1.50 Cucumbers, Fla., per crate, $1.00@1.50; string beans, Savannah and Charleston, per crate, $3.00@3.50; Florida; round, $1.0@1.50; Florida, flat, 75c.@$1.25; green peas, Norfolk, per ½ bbl. box, $1.0@1.25; N. C., per ½ bbl. crate, 75c.@$1.00, N. C., per bush. crate, 50@62c.; asparagus, Oyster Bay, per doz., $1.25@1.50; North N. J., per doz., $1.00@1.25; Southern, 75c.@$1.25; tomatoes, Bermuda, per ¼ x, 60c.@$1.00; radishes, per 100 bunches, 75c.@$1.00; cabbages, Chas. and Sav., per bbl., $2.00@3.00; Norfolk per bbl., $1.50@2.00; turnips, Norfolk, new, per 100 bunches, $2.00@3.00 rhubarb per 100 bunches, $1.00@1.00; onions, Bermuda, per crate, $1.50, squash, Fla., new, per crate, 50@75c.; turnips, Russia, per bbl., $1.50@1.75; beets, Bermuda, new, per crate, $1.75, carrots, per bbl., $1.50; lettuce, per bbl., $1.00@2.50; mushrooms, per lb., 50c.

WOOL.—There has been a pretty sharp demand for the moderate supplies here this week, and prices have advanced. This is encouraged by the more active movement in the goods market, and as well by the higher rates being paid for the new clips in California, Texas and at such Western points as have shown offerings. X and XX Ohio fleeces have sold here at 33@33½c.; spring California at 15@35c.; spring Texas at 15@2.c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, May 17th.

BEEVES.—Receipts for the week, 10,290 head; do., last week, 9,736 do. Warm weather and heavy supplies at the end of the week took the vim out of trade on the hoof and in the dressed meat market. At one period yesterday buyers almost made the price. Poor and common steers and oxen sold at 8@8½c. ₱ lb., to dress 55 lbs.; medium to prime steers at 9@10c., to dress 55@56 lbs.; extra do. at 10½@10½c., to dress 57 lbs.—outside figure or about 30 selected steers, 1,501 lbs. average, taken for export, alive. Week's shipments, 4,29 live cattle and 4,16 quarters of beef.

COWS AND CALVES.—A few good State found a buyer at $40; the range is as before. $30@50.

VEAL CALVES—Have been plenty and low, but are a little firmer at the close. Choice N. J. & Buck's Co., 5½@5½c., prime including State, 4½@5c.; poor to fair, including buttermilk, 3@4c. Hog-dressed not quotable.

SHEEP AND LAMBS.—Receipts for week, 31,543 head; do last week, 20,748 do. Sheep and lambs lavered buyers. Many lambs sent in a glove her too early. Clipped sheep ranged at 3½@5½c., the extreme fo fancy State wethers; lambs, 6@9½c.

HOGS.—Receipts for week, 23,333 head; do last week, 31,395 do. No public sales. Common to good corn-fed sold at $3.90@4.10 per 100 lbs. City dressed hogs, 4½@5½c.; a few State, 4½@5½c.

HORSFORD'S

Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD,

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

1879. 1879

BONE. BLOOD. MEAT.

NO ROCK PHOSPHATE USED.

The large and extensive Works of the BUFFALO FERTILIZER, destroyed by fire in July last, have been entirely rebuilt and supplied with new and improved machinery.

It is the leading Fertilizer now in use by the farmers of the States of New York, Ohio, Pennsylvania and Vermont, and the Canadian Provinces.

This Fertilizer is guaranteed for its purity, being manufactured entirely from ANIMAL MATTER. No rock or mineral phosphate or refuse acid from oil refineries enter into its manufacture.

Reading for the Young.

OUR COMING GUEST, JUNE.

A FAIR young maiden, who makes us an annual visit, has sent some sure tokens to give notice of her speedy arrival; and it behooves us, one and all, to be prepared with a joyous, heart-felt welcome. Her radiant beauty is the theme of every tongue; and to secure the gratitude of even the most insensible, she brings precious gifts, which none are too poor to be precluded from enjoying, none so rich as to undervalue.

Her eyes are of the deepest blue, cradled beneath lids of snowy whiteness. Her hair floats around her like a mist, by the sun tinged golden-hue. She wears a robe of green, varying from the most delicate shade to the richest emerald color, and at sunrise, when she appears the loveliest, her drapery is covered with tear-drops, which her lover, the day-god, as he ascends in his strength, kisses away. Her breath is like the odor of new-mown hay, and about her, as she moves on, floats the perfume of innumerable flowers which spring up at her feet. Upon her brow she wears a chaplet of white lilies, while in her hand she carries a cluster of roses—roses of every tint, for these most exquisite of Flora's offerings are the maiden's pride and chief ornament—some of unsullied white meet to adorn the tresses of a bride, others of varied hues, from the most sanguine purple to a shade as faint as that which dyes the cheek of girlish beauty. The starry blossoms of the strawberry, which spangle the meadows, at the touch of her rosy fingers blush into perfect ripeness and, with the floral treasures she brings, offer this fruit of a flavor so rare and delicate as to render it meet for the banquets of the dwellers on Mount Olympus.

Nor is she unattended by music. Birds of a thousand hues, and with notes as diverse as their plumage, chant their glad carols in the soft atmosphere which floats around her. Especially do the merry bobolink, the dear domestic martin and the solitary woodthrush rejoice in her presence. The first seems actually dizzy with happiness, for he makes no pause in his song, even when on the wing, but, careering in mid-air, pours forth a gush of sweetest melody; then, slowly descending, he alights upon the top of a tall herb, and while it sways under his fairy weight, he continues to warble those strains, so liquid, so enrapturing in their flow, that the listener may well address him, as Shelley does the English skylark:

"Teach me half the gladness
That thy brain must know,
Such harmonious madness
From my lips would flow,
The world should listen then, as I am listening now."

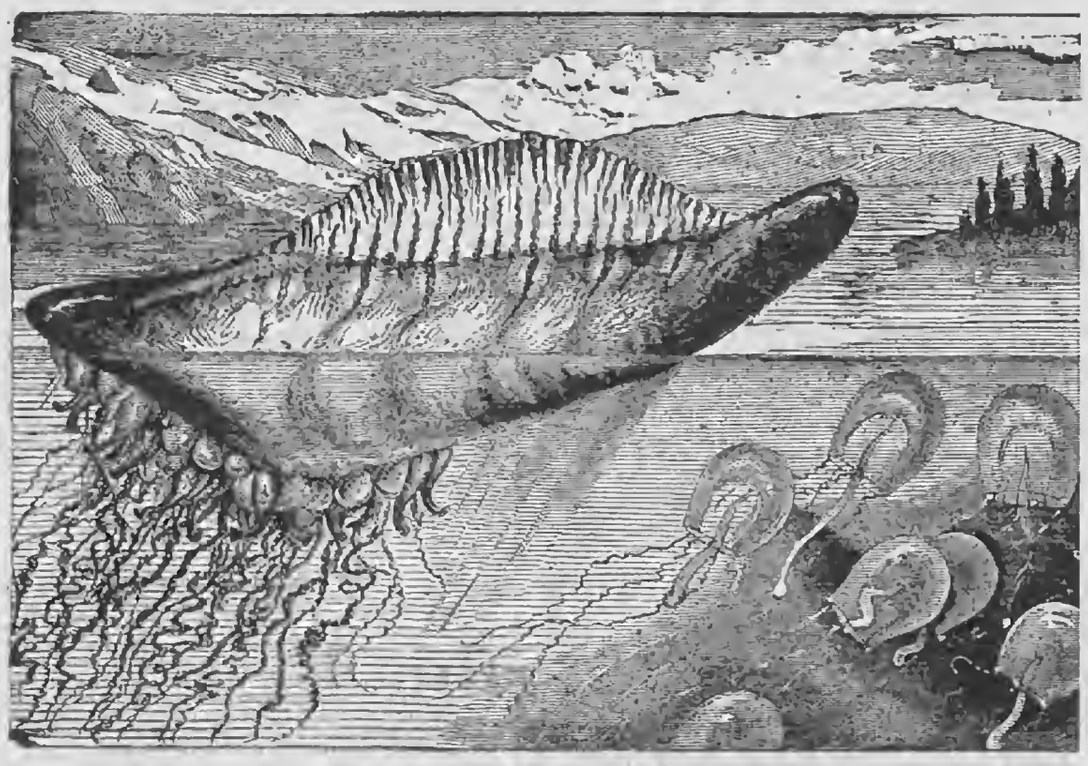
Assuredly do all the feathered tribe appear given up to joyousness while our gentle divinity stays. But her visit will be brief, and shall not we as well as the birds and flowers, make the most of her fleeting though blessed presence? Let us not confine ourselves to narrow walks and dusty streets, but go forth into the fields and upon the hills to gaze with unobstructed vision on all her loveliness. Let us open our hearts to imbibe her precious influences. A long period of scorching heats, or storms and snows, and piercing blasts will intervene ere she can return to gladden the earth. Before that time arrives, some of us who welcome her now may have received a summons to that better land of the glories of which her beauty is a faint type. May we then dismiss from our minds all envy, hatred, strife, and earth-born cares, all murmurs and repinings. May we learn from our radiant visitor new lessons of love, hope and cheerfulness. May gratitude to the Giver of all good, Who sends her to bless His unworthy creatures, warm our hearts. While the birds make every leafy arch resound with their untaught hymns of praise, shall we whose lips have learned a loftier strain remain silent? Shall we not bring the sacrifice of kind deeds and gentle words, the perfume of holy hearts, to lay upon God's altar? Then as we watch the roses withering—for wither we surely know they must—and see the lovely maiden depart, her emerald robe dimmed with the dust of earth, we can lift our thoughts to that fair land, whose flowers are unfading, whose pastures are ever verdant. Hail, then, bright type of perennial joys, thou fairest of summer's trio, thou freshener of the earth, cheerer of man's heart, hail to thee, sweet month of roses, thou ever-blooming June. CLOVER BLOSSOM.

THE PORTUGESE MAN-OF-WAR.

DID you ever hear of a Portugese Man-of-War? If so, and no explanation was given you as to what kind of vessel it was, you no doubt pictured to yourself a large ship with magnificent rigging and many guns. There is, however, another kind of ship called the Portugese Man-of-War, which is shown in the picture. It is not at all an imposing vessel, as it is at best only a few inches long and does not carry a single gun. It is a little animal that inhabits the tropical and adjacent seas, and one of the most lovely of the many beautiful creatures that live in the water. It is related to the jelly fishes, and its scientific name is Physalia, but from its habit of sailing about it is commonly known as the Portugese Man-of-War. Its body is an air-sack or bladder, the colors of which are very beautiful, being mostly of rich shades of blue and purple. The fringe-like crest is often of a pink or rosy hue. Beneath the air-sack are a great number of fleshy tentacles, which hang down like tassels and threads of blue silk. These are studded with starry pearls of the color of indigo, which form borders and spirals of an elegance hardly to be conceived.

In fair weather, these beautiful creatures may be seen sailing along upon the surface of the sea, the upper part of the body being inflated with air and acting like a sail; but in tempestuous weather they descend to the quiet depths of the ocean.

This and many others of the same class of animals have a peculiar power to sting very severely when touched. This power was doubtless given them as a means of defence, so that, although they are frail creatures and have no organs of locomotion that will enable them to avoid their pursuers by flight, they should not be left entirely at the mercy of their enemies. The sting is very painful, much more so than that of the nettle, and is caused by numerous cells, called thread-cells, found on the tentacles and other parts of the body. These thread-cells are very minute bags, each of which is armed with an exceedingly fine and sharp sting, which they can extend and draw in at pleasure. In



PORTUGESE MAN-OF-WAR.

the bag is a poison that flows through the sting into the offending body and produces a burning sensation. The motion of the sting is interesting. It is not thrust out by means of elastic cords, but the whole cell is turned or rolled out, like the turning of the finger of a glove. Large numbers of these animals are sometimes driven upon the temperate shores by the wind. UNCLE MARK.

LEARN TO WORK.

"You will always have a living, boys," I said, as I stood in the orchard watching their horticultural operations. "If you learn a profession and then find the field overcrowded, there will be nothing to hinder your hiring out to work in orchards, to take care of hot-beds and greenhouse—to plant, prune, graft and bud—all the little, nice work of an orchardist, and you may thank a good father for making these things pleasant and easy for you. To know just when, and how, and why to do things, from the experience of the early part of your lifetime will be a recommendation if poor, and in need, and a boy that keeps his eyes open, and his hands willing, on a fruit farm can learn a good deal of use to him all through life. It is a critical period in the life of a boy when he begins to think and talk of the future

'The thoughts of youth are long, long, thoughts,'

and he builds bright air castles that are doomed to fall, but are pleasant in the building."

"I talk as if I expected you were going to be *poor*, do I? Well, who knows. There are plenty of men who have been wealthy and by a sudden turn of fortune lost it all. Yet none have a better chance of a comfortable, *steady* living, than the farmer and fruit-grower. Their produce is always needed, it *must* be had; and, although all years are not alike, the chances of sudden downfall are less than in any other occupation. 'Have to work hard, you say.' Ah! but it is healthful, life-giving work, and I am sure not so wearing to soul or body as to drudge in a dark office, or behind a counter, with its opportunities for evil, its petty temptations and perplexities. While you sleep, the trees are growing, the garden is ready to unfold new beauties when you wake, you have God's grand aviary all around you, and a thousand blessings follow your steps. Pure air and water, milk and honey at a trifling cost of money and labor, rich returns of the choicest fruit and flowers, and the influence of a pleasant home."

ANNIE L. JACK.

A LITTLE SINNER.

LITTLE Goldlocks sat on a cricket at her mamma's feet, hearing papa read the Bible. He read all about the flood, and the ark, and Noah, and the animals. When papa shut up the book, Goldlocks sat with her chubby hands folded, thinking very hard.

"The rain fell and fell," she said to herself, "and then the ark went into the deep water, and Noah and his folks and all the cattles and sheeps went, too. If Jimmy will be Noah, I will be Noah's wife, and we can have the bath-tub for the ark, and the shower-bath will make rain 'nough, I guess."

Goldlocks didn't say one word out loud, but she sat there on her cricket, thinking and thinking. At last after everybody had left the room, she went to look up Jimmy. He was only four years old, and Goldlocks was six. You see, she was two years older than her little brother, and ought not to have led him into mischief.

"Want to make a flood, Jimmy?" asked Goldlocks.

"What kind of a fud?"

"Why, like Noah's! We'll play that all the folks in the house are naughty, and we are good; and I 'spose we might have the canary for a dove, and the geranium for an olive-tree to light on. Come up here in the bath-room, and I'll show you."

So off trotted that little mischief of a Goldlocks, up to the bath-room, as fast as her short, fat legs would carry her, and Jimmy trotted after her.

"Now, I'll show you," she said. Then she got into the bath-tub. But she soon saw that she wasn't in the right place.

"The wicked folks ought to be in here," she said, "'cause the good ones didn't get wet. We'll have the clothes-basket for the ark."

So Jimmy climbed into the basket, and Goldlocks turned on the shower-bath.

"Where am the bad ones?" asked Jimmy.

"We'll have the gray cat for one," said Goldlocks, "'cause she scratched me t'other day."

"She scratched me two, free, six times," said Jimmy.

Then Goldlocks caught the gray cat and took her oldest dollies, and put them in the flood. Jimmy sat in the ark, and laughed and clapped his hands. Kitty didn't like being a sinner in the flood, and she struggled hard to get out; but the little girl held her down stoutly.

"Jump out of the ark, Jimmy," she said, "and open the bird-cage door; we must have a dove. You can climb on the sewing-machine. Mamma lets Dick out quite often."

Jimmy obeyed, and then ran back to his refuge. But just as he was safely seated in his ark there was a splash and a cry, and nothing was left of Miss Goldlocks but her feet sticking up in the air. She had fallen into the flood. Jimmy screamed as hard as he could, and mamma came in a great fright. The poor half-drowned cat rushed out as mamma opened the door, and the canary came very near going too.

"What's all this?" asked the mother, as she pulled poor streaming Goldlocks from the water.

"It's the fud, and I'm Noah," said Jimmy.

"And I meant to be Noah's wife," said Goldlocks, "and the cat was one of the sinners."

"And you got into the sinner's place?" said mamma.

"Yes," sobbed the child.

"Well," said mamma, as she put the birdie back into his cage; "you were doing just as the people did in Noah's time. They disobeyed God and you disobeyed me; so you got into the right place after all."

"Well, I dess I'm saved, anyhow," said Jimmy, scrambling out of the ark.—MRS. M. F. BUTTS, *in Christian Register*.

IN THE BLACK MARIA.

NOT long ago a lad of nineteen came up from the country to one of the sea-board cities, and secured a position in a large and well-known importing house. He was a gentle, blue-eyed young fellow, almost womanish in his tastes, and in his love for his home and his family.

Unfortunately, he had no friends in the city. His evenings were passed in absolute solitude, or in the vulgar society of a cheap boarding-house.

The boy became depressed, gloomy. He fancied he needed "bracing up," and fell into the habit of dropping into a cheerful restaurant for a glass of wine.

He soon made friends there who would join him in a bottle. As with most men not accustomed to intoxicating liquor, he was maddened by a little.

One night, being drunk, he quarreled with his companion, and stabbed him with a knife which lay on the table. The wound was not serious, but the lad was arrested and kept in the police-station until morning.

He was then led out (being now sober and in his right mind), and ordered to get into the prison van (known to the town as the Black Maria), which waited to convey him to prison. He shuddered and turned ghastly pale, muttering—

"What will my father say?"

But he was thrust in and the door locked. There was no one else in the van. When they reached the gate of the prison the door was opened. The boy lay dead beside it, the blood from the throat clotting the face which his mother so lately had kissed.

This is an absolutely true story. It teaches to young men the madness of tasting that first glass of liquor, of yielding to the temptations which beset friendless boys on every side in a great city. But has it no meaning to those older men, Christians and fathers, who leave such lads without a friend, and put out no kindly hand to hold them back from temptation?—*Youth's Companion*.

BE busy in your garden; now is the time when your skill, endurance, and industry will be put to the test. Water, weed and cultivate your plants with untrammeled fervor.

Sabbath Reading.

GALLING THE ANGELS IN.

WE mean to do it. Some day, some day
We mean to slacken this fevered rush
That is wearing our very souls away,
And grant to our goaded hearts a hush
That is holy enough to let them hear
The footsteps of angels drawing near.

We mean to do it. Oh, never doubt,
When the burden of daytime broil is o'er,
We'll sit and muse, while the stars come out,
As the patriarch sat at the open door
Of his tent, with a heavenward gazing eye,
To watch for the angels passing by.

We see them afar at high noontide,
When fiercely the world's hot flashings beat;
Yet never have bidden them turn aside,
And tarry awhile in converse sweet;
Nor prayed them to hallow the cheer we spread,
To drink of our wine and break our bread.

We promise our hearts that when the stress
Of the life-work reaches the longed-for close,
When the weight that we groan with hinders less,
We'll loosen our hearts to such repose
As banishes care's disturbing din,
And then—we'll call the angels in.

The day that we dreamed of comes at length,
When tired of every mocking quest,
And broken in spirit and shorn of strength,
We drop, indeed, at the door of rest,
And wait and watch as the day wanes on—
But the angels we meant to call are gone!

[*Christian Weekly*.

LOVE AND DUTY.

REV. J. E. WELTY.

NOT long since we heard a person express the following sentiment: "Away with the idea of duty. Duty is so cold, formal, lifeless. I do not believe in any one being a Christian from a sense of duty. I want a man to be a Christian from love, pure love, and from love only." It is not too much to say that this is mere sentiment. Perhaps we should say it is bosh. Love and duty are cardinal virtues. Neither is to be exalted at the expense of the other. It must be admitted that where love predominates, where love prompts, there we shall have the higher type of Christian life. Love makes the warmest, most ardent, and most energetic disciple, as it makes the fond and steadfast friend. Love admires, adores, and is even ready to make great sacrifice. Such was the love that permeated the heart of John, the beloved disciple. Where love like this is the ruling power in the heart, there duty becomes an easy task. When love leads duty keeps no idle pace. The loving disciple not only performs cheerfully what is duty, but seeks also opportunities for new activity.

Love was the superior motive in the person of the Lord Christ. It was the first great bond between the Father and the Son. But, let it be observed, that closely related to this was obedience. Jesus delighted to do the will of God. And whilst He so loved us as to give Himself for us, His devotion to duty was so great that He humbled Himself and "became obedient unto death, even the death of the Cross." But mens' hearts are not, by nature, warm with love to the Father, nor to the Lord Jesus. "Herein is love, not that we loved God, but that He loved us, and sent His Son to be the propitiation for our sins." The great demand on us is love. "Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind. This is the first and great commandment." But with this God also demands obedience. "Fear God and keep His commandments, for this is the whole duty of man." This is the Old Testament form of a demand that is made all through the Scriptures. "My son, give me thine heart." And it is nowhere taught or implied that obedience is to be withheld till love first makes us feel like doing. The sinner, in his coldness, is met with the demands of the gospel. Love, service and worship, are required at his hands. If he would render all his tribute he must turn into the path of obedience. He must follow along that path. In his wicked way, and under the dominion of his unrighteous thought, the sinner cannot have warm impulses of love. Yet for all this he is to flee from the wrath to come.

How, then, is he to begin? By turning, in obedience to the Lord, to the word of his grace, and to the demands of His love. In the rendering of this obedience there will be a drawing near to Christ, and a learning of Him. And those who are learners of Christ are in the highway that leads to admiration, to sweet communion, to fond attachment, to love. It is so, then, that love and duty are two phases, or activities, of the Christian life. They complement each other. They are both necessary. Duty rendered leads to love, and love enkindled makes duty a pleasing task. Some very excellent people are much concerned, and often lament greatly, because they do not have warm, gushing feelings of love. Though they go along in an even way and are attached to the Christian cause, yet they conceive that their love is so cold. They do not have that sensible delight they imagine others have. But it should be remembered that love is not warmed by lamenting over love's poverty. The heart is not delighted by pondering over its want of delight. Dismiss such reflections about the measure and intensity of love. Turn unto the Lord. Meditate in His law and delight shall be the return. You will warm love by steadily and cheerfully discharging duty. Follow devoutly and prayerfully along the path of obedience, ever remembering that the path of obedience is the path to higher degrees of love, of happiness and of peace.—*The Interior*.

IF we do not subdue our anger, it will subdue us; it is the second word that makes the quarrel—*A. James*.

PERSONAL ITEMS.

Senator Kernan's oldest son has gone abroad to study for the priesthood at the same institution at which General Sherman's son, Thomas, is now a student.

General Butler, although not in Congress, intends to spend his winters in Washington. He will occupy his mansion on Capitol Hill, which has been rented for some years to Senator Jones, of Nevada.

King Thackombau, of the Fiji Islands, is one of the finest-looking figures ever done up in bronze, but there is no use talking, he is not a bit regal when receiving visitors—he lies at full length upon his stomach, on a mat.

"Look pleasant," said the photographer, to Charles Francis Adams; "smile a little." Mr. Adams slowly and frigidly smiled. "Mother of Pluto!" howled the artist, "cry, cry a little! That'll help your expression some."

Henry Russell, the singer of the "Life on the Ocean Wave," the "Maniac," the Ship on Fire," "Cheer, Boys, Cheer," and other popular songs of thirty years ago, is still alive and hearty, and appeared on the stage of the Haymarket on the occasion of Mr. Lamar Blanchard's benefit.

General Grant is the owner of two Arabian horses of the purest blood—a gift from the Sultan of Turkey. One is of a dapple gray color, and is called "Djeytan" (the panther), and the other is a magnificent black follow with a white star on his forehead, and named "Missirli." They are on board a steamer on the way from Constantinople to New Haven.

Old Harrison Davis, from Davis' Bend, Mississippi, who was over seventy, fell sick at Lawrence, Kansas, the other day. He was one of the searchers for the Promised Land. He refused medical aid, saying: "Why, bless you, children, de Lord has smiled on me, and I'll close dese ole eyes in de land ob promise," and, with a "Bress de Lamb," the light left his old face and his days were ended in the happy land he had sought in Kansas.

Nearly a quarter of a century ago Todleben (who is a German) said to a young friend: "To get ahead in Russia you have only to write a book. Never mind the contents; he who has written a book can reach any position." This, says the Railroad Gazette, is quoted apropos of the present Minister for Railroads. Some years ago a young man wrote as a thesis for his degree, "The Economies of Railroads," at least one-half of which is said to have proved his utter ignorance of railroad management. Nevertheless he became a professor and the head of the department in the Ministry of Finance in which railroad affairs are concentrated.

Read of, procure and use Hop Bitters, and you will be strong, healthy and happy.

New Publications.

THE GOSPEL OF JOY!

THE GOSPEL OF JOY is a new Singing Book of unusual beauty for Gospel Meetings, Camp Meetings, Devotional Meetings and Sunday Schools.

By Rev. SAMUEL ALMAN and S. H. SPECK. It contains a large number of new and very superior Hymns and Tunes. The general style is very cheerful and bright, as befits a collection that has so much to say and sing about

"Glad Tidings of Great Joy"

Both words and music are of an elevated character, commending themselves to persons of refined taste, and the "dancing measure" so prevalent in many recent compositions has been carefully avoided.

Price 35 cts., for which specimen copies will be mailed to any address.

See Decoration Day Music in the MUSICAL RECORD, &c.

GOOD NEWS! (35 cts.) the genial Sunday School Song Book, has thousands of Friends. Do not fail to examine and try it. There are 270 Songs, in the composition or selection of which great taste and ability have been displayed. Examine also "Shining River" and "The River of Life," two standard books of great beauty.

Odit and Humor.

"It's only a spring opening, ma," exclaimed that awful boy, as he exhibited his torn trousers after a leap over a picket fence.

A WESTERN editor speaks of his rival as "mean enough to steal the swill from a blind hog!" The rival retorts by saying: "He knows he lies: I never stole his swill."

MISS BONCŒUR (who has been reading to her Sunday-school class): So you see, children, the good man Aaron's swallowed up all the other rods. Tommy (with a heartfelt sigh): Gorry, don't I wish dad's old tickler had been there!—*Harvard Lampoon.*

Oh, he is a legislator,
For he himself has said it,
But it's hardly to his credit
That he is a legislator,
For he might have been a plowman,
A banker or a showman,
Or perhaps a tax collector;
But in spite of all temptation,
To fill some useful station
He remains a legislator,
A rooster legisla-tor.—*Phila. Times.*

"JOHN, did you go round and ask how old Mrs. Jones is this morning, as I told you to do last night?" "Yes, sir." "Well, what's the result?" "She said that seeing as how you'd had the impudence to send to ask how old she was, she'd no objection to telling you that she's twenty-four."—*Almanac.*

Protect the System from Malaria.

It is possible to do this even in regions of country where miasma is most rife, and where the periodic fevers which it causes assume their most formidable types. The immense popularity of Hostetter's Stomach Bitters is very largely attributable to the fact of its efficacy as a remedy for chills and fever, bilious remittents, and as a preventive of the various forms of malarial disease. In those portions of the West and South where complaints of this nature prevail, and in the Tropics, it is particularly esteemed for the protective influence which it exerts; and it has been very widely adopted as a substitute for the dangerous and comparatively ineffective alkaloid, sulphate of quinine. Physicians have not been among the last to concede its merits, and the emphatic professional indorsements which it has received have added to the reputation it has obtained at home and abroad.

THE FORCE OF EXAMPLE.

Aunt Emily.—"Why, Nellie, don't you know it is unkind to catch hold of your Sister and Pull her Hair?"

Nellie (who doesn't see it).—Well, Auntie, I saw you holding Cousin Frank round the neck quite tightly, yesterday, when Mamma was out, and Pulling his Hair, and he didn't say anything!"

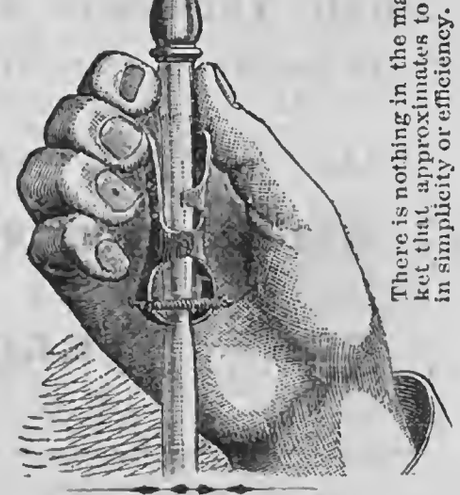
CHECK SPRING
used on the tube to
Phelps' Nasal Douche
for administering the
NORWEGIAN BALM
FOR
CATARRH



Pressing upon the wings of the check-spring, opens its mouth, which allows the dilution to flow, and when the pressure is taken off, the flow immediately stops.

There is nothing in the market that approximates to it in simplicity or efficiency.

EXTRACT FROM TESTIMONIAL.

903 Eight Ave., New York, Dec. 17, 1878.

I think your remedy for Catarrh "One of the greatest discoveries of the age." Before using the NORWEGIAN BALM my wife *suffered untold misery for years.* We sought medical aid, far and near, but to no effect. Our regular Physician, distinguished for his knowledge, skill and honesty, pronounced the disease incurable; that it would extend from the nasal organs to the throat and bronchial tubes, and finally to the lungs,—and that death would be the result at no distant day. This was well nigh the case. But in your NORWEGIAN BALM *she found immediate relief;* the extremely offensive odor of her breath, from which she had suffered so many years *entirely disappeared within two weeks* after she commenced to use the BALM. After having used only one bottle, if not fully cured, she feels well on the way. C. C. SULLIVAN,
Produce and Commission Merchant,
155 Chambers Street, New York.

Quart Bottle, $1.00. (*sufficient for Two Months' use.*) Trial Bottle, Twenty-five Cents.

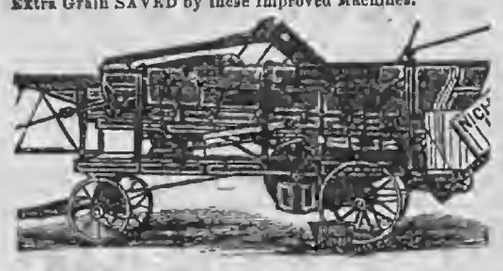
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.

STEAM Power Threshers a Specialty. Special sizes of Separators made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, both Portable and Traction, with Valuable Improvements, far beyond any other make or kind.

THE ENTIRE Threshing Expenses (and often three to five times that amount) can be made by the Extra Grain SAVED by these Improved Machines.



GRAIN Raisers will not submit to the enormous wastage of Grain and the inferior work done by all other machines, when once posted on the difference.

NOT Only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual Belts and Gears. Makes Clean Work, with no Litterings or Shatterings.

FOUR Sizes of Separators Made, Ranging from Six to Twelve-Horse size, and two styles of Mounted Horse Powers to match.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "VIBRATOR" Thresher Outfits are Incomparable.

Biographical.

MARSHALL PINCKNEY WILDER.

Col. Wilder's recent accident has awakened wide-spread sympathy and solicitude, and while it gives us great pleasure to state that the latest bulletins report that he is recovering—being able to move about with the aid of crutches—we feel that there are many among our readers who would appreciate a brief *resumé* of the life and work of the honored President of the American Pomological Society. Hence, we this week present his portrait in continuation of our series.

Marshall Pinckney Wilder was born Sept. 22, 1798, at Rindge, N. H. He is the eldest son of Samuel Locke Wilder, Esq. The family has been conspicuous since revolutionary times, Col. Wilder's grandfather, among other honors, having been one of seven delegates from Worcester County in the Convention of Massachusetts, who voted in favor of adopting the Constitution of the United States. The old Worcester Magazine said: "Of all the old Lancaster families, there is no one that has sustained so many important offices as that of Wilder."

Young Marshall went to school at the age of four years, and at twelve entered New Ipswich Academy. He was there one year, and, returning home, was put under the tuition of Rev. Joseph Brown; it being his father's idea to give him a collegiate education. Mr. Wilder preferred an active life, and when he was sixteen his father gave him the choice of either qualifying himself for the life of a farmer or merchant, or to fit himself for college. He chose the first, and among the lakes and forests of his native place laid the foundation of that enduring health to which he has in no small degree been indebted for the mental and physical energy that are among his chief characteristics.

At the age of twenty-one his father took him into partnership, which continued until 1825, when, in search of a wider field, he moved to Boston. The firm of Wilder & Payson was at once formed, and under various modifications of firm names, Mr. Wilder has continued a merchant of Boston to the present time, honored and successful.

But trade and the acquisition of wealth were not the all-engrossing pursuits of his mind. After devoting a suitable time to business, he gave his leisure to horticulture and agriculture, for which he had a peculiar taste. He spared no expense; he rested from no efforts to instil into the public mind a love of employments so honorable and useful. He cultivated his own grounds, imported seeds, plants and trees, and, by his example, endeavored to encourage the labor and elevate the rank of the husbandman. In his pursuits, Col. Wilder seems to have realized and practised one of the principles which have such an influence on one's life—the philosophy of habit. He is an early riser and devotes the morning to reading, writing, or rural affairs. In the middle of the day he attends to his mercantile business in the city, and the evening is spent with his family and books. His leisure—if so busy a man may be said to have any—he has devoted to his pen, which has already filled several large volumes with descriptions and delineations of fruits and flowers proved under his own inspection. Floriculture was one of Mr. Wilder's favorite pursuits. His camellia-house is supposed to have contained the best collection in the country. Two seedlings, "Camellia Wilderi," and "Mrs. Abby Wilder" were named in his honor by the Mass. Horticultural Society. Soon after the organization of this Society, he became identified with it, and for eight successive years he presided over it. In fact, Col. Wilder has been so prominently associated with all progress in agriculture and horticulture, that his name is indissolubly connected with their advancement.

But it was in Pomology that he was most successful and most widely known. The Pear in his orchard of 2,500 trees and 800 varieties, became as noted as the Camellia in his conservatory.

In 1848, as President of the Mass. Hort. Soc., he headed a circular calling a convention of fruit-growers throughout the country. This resulted in the organization of The American Pomological Society. The writer can but regret that space limit forbids any but the baldest mention of many of the societies Col. Wilder was mainly instrumental in projecting, and the history of whose formation so clearly portrays the energy and resources of the man. To him Amherst College is indebted for its existence, and the State Board of Agriculture (Mass.), is the lineal descendant of the old Norfolk Agl. Soc., which was created by Col. Wilder. He is at present the President of the American Pomological Society, senior Member of the State Board of Agriculture, senior Trustee of the Massachusetts Agricultural College, Honorary President of the Norfolk Agricultural Society, a member of the Executive Committee of the Massachusetts Horticultural Society, President of the New England Historic-Genealogical Society, a member of the Government of the Institute of Technology, a Director of the New England Life Insurance Company, and of the National Insurance, and of the Hamilton National Bank; positions which he has held for thirty-five years, and senior partner of the firm of Parker, Wilder & Co.

The life of Col. Wilder is a striking instance of what may be accomplished by industry, and the concentration of one's intellectual powers upon one grand object, that of raising the standard of terraculture to a higher rank among the great pursuits of a nation. He has excelled in all he undertook, because he knew the measure of his own abilities. His plans were matured by deep thought and executed with a zeal resulting from a clear, practical head. From the stand-point of the Massachusetts Horticultural Society, he originated the American Pomological Society; then the Norfolk Agricultural Society; then the State Board of Agriculture, and the Massachusetts Agricultural College, and finally the United States Agricultural Society. His military title is the result of his interest in various militia organizations.

After the death of his first wife in 1831, he sought retirement in Dorchester, where he has re-married twice, and now lives blessed in the most delightful domestic life, and surrounded by all influences that contribute to the charm of existence. The accident to which we have alluded, was occasioned by a fall in the State House, resulting in a fractured thigh.

When we look at his success in the arts of cultivation, and then turn from these more humble objects and consider those other memorials, especially the noble institutions which owe their origin and success, in a great degree, to his influence and efforts, it cannot be doubted that in the roll of the benefactors of mankind, one of the most prominent names in this age and country, will be that of Marshall Pinckney Wilder.

Marshall P. Wilder

Pomological.

THE PEAR BLIGHT.

CLINTON.

The article on the pear blight, by Mr. B. Batcham, which appeared in the Rural of March 22, arrested my attention, more especially as the writer professed to speak of the cause of the malady, and the means of its prevention. As I had given the subject much study for many years, I hoped to gain more new light in relation to it, and thus be enabled to reach satisfactory conclusions in regard to a matter which has hitherto seemed to be involved in considerable mystery. When I say frankly that I have failed to do so, it may be equivalent to an admission of my own obtuseness of intellect; but I can't help that.

That the soil has much to do with the health and vigor of the pear tree is undoubtedly as true as it is of most other trees and plants. It has long been understood that a deep clay soil, or a calcareous loam is suitable for the pear tree, and also that the soil should be reasonably dry and entirely free from stagnant water. But that a clover sod is essential, or even of any special advantage, is not yet fully proven. Further observation is necessary to confirm the opinion in the mind of the studious cultivator. In speaking of the Ohio State Pomological Society, Mr. Batcham says: "We have paid but little attention to theories, for in most cases they are not sustained by the facts." This is certainly wise, and the rule would, I think, exclude the clover theory, at least for the present. Facts that have come under my own observation, during many years' experience, do not go to sustain the theory. In an article of my own, on the "Twig Blight," which chanced to appear in the Rural, simultaneously with the article on pear blight, which I am now considering, I took the liberty to caution your readers against a "confusion of terms, and the confounding of diseases which are quite dissimilar in character, although they may be productive of similar results." I think your correspondent has fallen into the very error thus referred to, when he says the frozen sap blight "only differs from what is termed the fire blight, in its predisposing cause." My own observation satisfies me that they are essentially different in character as well as in cause. The sap blight is distinguished by its appearing earlier in the season, usually not later than June, and by the viscous, clammy sap, which exudes from the wounds made by the knife, emitting that smell of fermentation of which Mr. B. speaks; also, by the appearance in the spring, of dark, shriveled and dead blotches of bark on the trunk or branches, which may not be noticed until the leaves begin to show signs of the disease, but by careful examination they may be discovered some time sooner. This blight is not confined exclusively to the pear, it being quite likely to appear on apple trees of rapid growth, like the Baldwin and Greening, for instance, while slow growers, like the Northern Spy, are very rarely injured by it. It appears more frequently on the pear than on the apple, the pear being of a more tender and delicate growth.

There is but little difference of opinion as to the cause. If the tree makes a late growth in the fall, so that the new wood does not become properly matured before an ensuing severe winter, there is always danger of the sap blight as a consequence. But it is not always the mere freezing of the wood and sap that causes the injury. The sudden thawing of the bark, by the direct rays of a bright sun, aided perhaps by a strong reflection of light from a crusted surface of snow while the main body of the wood and bark is still frozen, adds materially to the injury. As evidence of this, it will be found that this kind of blight, quite generally, appears on the southerly side of the trunk or branch affected. In some cases, when young trees are affected, the bark will be found to be ruptured, and partially loosened from the wood on each side of the rupture. But the more serious injury is produced when the bark is killed without being ruptured. In such cases, as spring opens, the tree or branch puts forth its leaves as usual, yet as the season advances, the leaves, while showing but little discoloration, begin to droop and wither; and on examination a black spot on the bark will be readily discovered, and if sufficiently extensive, that portion which is above the affected part speedily dies; the vigorous putting forth of the leaves previously noticed having been but a futile effort of nature to utilize the sap remaining in the trunk or branches, to repair the damage.

For this form of blight there seems to be no remedy. The best preventive I have ever known is to shade the southerly side of the tree, so that the direct rays of the sun shall not reach it. The trunk of the young tree is most likely to be affected. A piece of board, of suitable length, placed against the southerly side, and fastened there, will be sufficient. Some cultivators have been at the pains to wind the trunk with twisted ropes of hay or straw, with satisfactory results. Covering

with a piece of cloth is also effectual. Acting on the same prineiple, I have always recommended, for the protection of any tender tree or shrub during the winter, that the protection be placed on the south and east sides of it, in preference to the north or west sides. It is not the severe freezing which injures the tree, but the sudden *thawing* of a portion of the surface which works the mischief, as I have already intimated.

The pear blight proper is no new disease. It has been noticed and described at different periods during the past 150 years. Heretofore it seems to have prevailed but for a few successive years at the most, in any one locality, while during the years of its absence, the trees have become vigorous and fruitful. This fact alone is sufficient to prove that it is not produced by climatic influences, and that it is entirely distinct from the frozen sap blight, which is liable to appear after any unusually mild fall, which chances to be followed by a severe winter. It is also, as already intimated, distinct, in its appearing later in the season, frequently as late as August, or even in September, after the fruit is partially or fully formed. The progress of this blight is usually rapid, so that in a very few days after the first indications of it are discovered, the leaves become blackened, and die, without any previous withering, and the wood becomes shriveled, dry and hard, so that it is difficult to cut it with a knife, and there is none of that fetid smell in either the wood or bark, which usually accompanies the sap blight. A careful observer will rarely be at a loss to determine to which class any particular case of blight properly belongs. I am aware that pomologists have heretofore been quite inclined to attribute the latter form of blight which I have described, to the work of an insect, which some have even attempted to describe. But as that theory seems now to be pretty generally abandoned, I will not occupy space by repeating what I have so recently said in regard to it, in the RURAL of March 22.

Mr. Bateham assumes "the fact as established, that the blight is of a fungus nature." This, I submit, is adopting a theory "not fully sustained by the facts." He admits that the theory is not new, but believes "it has not been distinctly stated before." By examining the Report of the U. S. Department of Agriculture for 1872, at page 188, he will find an article on pear tree blight, by "Thomas Taylor, Microscopist," in which the theory is distinctly stated, and the article has the merit of giving evidence of careful study and patient, scientific investigation. And yet *he* falls into the too common error of confounding the several terms, frozen sap blight, leaf blight, summer blight, twig blight, etc., some of which I claim are entirely distinct. To quote his own words, he says: "My experience leads me to suppose that the pear blight is a local fungus fermentation of the genus Torula, and which may be developed under any one of a number of causes." These causes he specifies to some extent.

Now this fungus theory, although seemingly founded on careful, microscopic examination, under varied circumstances, is still not put forth by him with any great degree of positiveness, as the language I have quoted will show. Undoubtedly he discovered, in some cases, fungi in the diseased parts of the tree, as he asserts, yet they were not always thus discovered, for he admits that he "failed to find any fungi inhabiting those portions of the blighted bark, which seemed deficient in albuminous matter." And even if there were no exceptions of this kind, is it certain that the fungi originate the disease? May it not be that the fungi are only one of its consequences? By many it has been claimed that the black-knot disease which blights our plum and cherry trees is of fungoid origin, while others have argued with equal pertinacity that it is caused by an insect, because the larva of the curculio or other insect is often found in them, the insect having punctured the excrescence with its ovipositor while it was in the soft or spongy state. But Dr. Fitch, our N. Y. State Entomologist, after careful investigation, arrives at the conclusion that "these excrescences are not of insect origin, and are not a vegetable fungus, but are properly a disease of the tree, in many respects analagous to the cancer in the human body."

Now, may not the opinion of this learned entomologist, furnish us with a key to the solution of the vexed question as to the cause of the pear blight? May we not well consider that, also, to be a disease of a cancerous nature, spreading and extending, and causing ultimate death, if not checked in its progress? The fact that the most certain remedy yet discovered is the prompt and thorough excision of all the affected parts, would seem to give color to that view of the matter. The theory seems certainly more plausible than either the fungoid or the insect theory. The *twig blight* of which I spoke in my recent article, by its not extending downward, thereby affecting the matured wood, shows itself to be lacking in that cancerous character which so generally marks the pear blight.

Oneida Co., N. Y., March 25.

Horticultural.

HOW I PLANTED MELONS.

THE difficulty in starting melon, squash and cucumber seeds early, is in getting the ground warm enough to force an early growth. Market gardeners grow cucumbers in hot-beds where the soil is heated by steam pipes, and in such circumstances the vines thrive luxuriantly. I have sometimes made a deep hole where the seed was to be planted, filled it two-thirds full of coarse manure and then put enough fine earth to even it with the surface and make a good seed-bed. The manure ferments and furnishes heat early, but it is apt to become excessively dry late in the season and thus prove a positive injury. This spring I thought I would try an experiment. Digging a hole not so deep as usual, I filled it partly with fine manure mixed with earth and on this I strewed some good unleached ashes to liberate the ammonia, which it did quite freely. Then I poured in a quart or more of water as nearly at the boiling point as I could get it, covered quickly with fine rich earth to the depth of two or three inches, and in this I planted the melon seeds. Of course, this heat will rise, and if unchecked, be radiated from the surface, but I provided against that by covering the hill, or rather the place where the seed was planted, with a shingle. This serves in part to keep the ground moist and warm during cool nights. Of course, the covering will be removed before the plants are up.

The effect of this hot water will, I think, be manifest through the season. It takes a long time for the sun to warm the earth downward, as the natural tendency of heat is the other way. The water was purposely made hot in order that less might be required. Possibly a better way would be to dig a much deeper hole and place in the bottom some heated stones. Burying stones is often an economical way of getting rid of them, and if they can be heated very hot and buried where some plant needing much heat is to grow, two good purposes will be accomplished with little extra expense.

The effect of ashes on highly ammoniated manure may be objected to. I used hen manure and though partially mixed with earth before the ashes were put on, there was a perceptible smell of ammonia, showing that some was escaping. But I am sure that much more was absorbed by the earth in contact with the manure. So soon as the hot water was put on and the whole covered with dry earth, all smell of ammonia ceased. Yet the effect of the potash in liberating ammonia was going on the same as before, and probably more rapidly from the effect of the heat. The result is, that under the hill the roots of the melons will revel in the richest kind of plant food. It is probable that being covered up from air and light, the potash and ammonia will form a nitrate of potash, one of the very best manures for any plant. In fact, I used the ashes so as to economize manure. Two or three shovelfuls of rich manure on ground already rich from frequent manuring, are a waste for a hill of melons or cucumbers. By no possibility can the plants need so much, and we only apply this superfluous quantity because it is better to waste some than have the plants suffer a lack. Thus we waste fertilizers which are always scarce and needed elsewhere, because they are not in shape to be used. I never put so little manure under melon and cucumber hills before; but I have no doubt that the vines will be as thrifty as usual.

Plants which have been forced as above described, should be protected after they are up by square boxes over the hills which should be covered at night to retain the heat. The boxes may be kept on until the plants are nearly ready to run, by which time the weather will be warm enough for them to grow rapidly in the open air. W. J. F.

Monroe Co., N. Y.

NATURAL HYBRIDIZING.

SOME thirty years since while visiting in the south part of Albany County, N. Y., I was presented with some very large white pale or climbing beans, a kind I have never seen in market. I was much pleased with the produce from them. A friend visiting the fair of the American Institute of New York a few years after, obtained a dozen of the beans called the "London Horticultural." He thought them a new variety but they were known to me as the "Cranberry Bean." From these I planted one hill at the end of a row of my pet whites, but did not think enough of them to save any of the produce. The next season I was surprised to see the blossoms of my beans, which were before of a snowy white, mixed in with bright scarlet ones and the beans mixed nearly one half with beans of the same size and shape as the whites, but in color delicately mottled with purple on a dark, nearly black, ground. This was accompanied with an increased yield but no change in flavor. I have occasionally raised them since, but they dwindle in produce and are now nearly seven-eighths colored.

I raise a few watermelons for family use and always save seeds from the best, and when I plant I take all the seeds I have, and mix them, plant what I want and save the rest till next year, so that some of the seeds are likely to be quite old. I often had melons with white cores and black seeds, but think I never saved seeds from them, but am not sure. My melons were generally small with red cores and dark-brown seeds. I never saw white seeds till this past year when all my melons were either large or of good size, all white seeds, red cores, skin delicately striped or clouded with green and milky white, melons weighing 20 to 35 pounds and of excellent flavor. There being no other melons within 100 rods for years before, I must conclude that there is much benefit from the mixing of seeds, or that Nature has taken special pains to improve my melons. S. B. PECK.

WEEVIL-EATEN PEAS.

SOME time ago we noticed a short article in a contemporary in which the writer pronounced weevil-eaten peas utterly worthless for seeding purposes. Later we read in an article by Prof. Riley a statement entirely contradictory of the above, saying that such peas would grow almost as well as sound ones.

To satisfy ourselves on this point we selected 70 weevil-eaten peas and carefully planted them. Of these 70 peas only one grew, producing a very sickly plant, so we cannot endorse Prof. Riley's statement in regard to the vitality of such peas. Sometimes the embryo is injured, at others not; but it stands to reason that though the plumule should be untouched the vitality of the peas must necessarily be weakened, as a considerable portion of the nourishing matter in the cotyledons is eaten away.

The pea weevil, Bruchus pisi, is a very small beetle only about one-tenth of an inch in length. It pierces the pod and deposits its eggs in the peas within as soon as these are formed. The larva is footless and lives within the pea, feeding on the rich juices; though very small, it is large enough to be readily seen with the naked eye. By the time the peas ripen it eats through the seed coats, and, remaining in its cell, assumes the pupa state. During the winter it changes to the imago, and on the arrival of spring leaves the pea, mates, and is ready to begin its destructive work as soon as the young peas begin to form.

Dairy Husbandry.

CREAM-RAISING.

L. S. HARDIN.

LIKE Brother Bliss, I too have received a pressing call to say something on the subject of the "cream-rising" of Dr. Hoskins or the "cream raising" of Brother Bliss. One trouble with me in giving a learned opinion on this subject, is that I have written several articles lately wherein I expressed the opinion that nobody had yet discovered the correct theory of cream "appearing at the top of milk." It hardly becomes me, therefore, to settle this question finally and for ever, as my learned cotemporaries have done. The fact is, the theories of both these gentlemen seem to possess so little solid matter that no man need feel oppressed with their profundity. Now, if Mr. Bliss's butter globule does not "rise," then a balloon doesn't. In fact, nothing can rise, according to this philosopher. He tells us that "cream, in common with all other matter, is inert and cannot act or move except as it is impelled by some external force." Why cannot the cream rise up as well as the milk go down? Perhaps it is the rising of the cream that causes the milk to go down. Such things have been. Webster, for instance, tells us that a fog rises from the river. Here is something (water) heavier than air, actually forcing its way up, so that it rises and compels the lighter air to go down. May there not be some similar trouble between skim-milk and cream? However, I am getting too profound now for the average dairyman, and am not exactly certain I understand what I am talking about myself.

Mr. Bliss says he is not willing to test milk by the number of pounds it requires to make a pound of butter, because he can name some objections to this method, as the breed of the cow, time since calving and quality of feed, all tending to change the quality of the milk. Theoretically this is true, but practically outside of the Jersey cow—which can easily be avoided—it is not hard to find ten cows that yield collectively an average quality of milk in midsummer. Cows' milk is a crazy substance at best, and it is a rare thing to get similar results from a couple of given sets of experiments, but the idea of weighing the skimmed milk, as Mr. Bliss says he does, to determine whether or not the milk is fully creamed, strikes me as the most impracticable of all methods. Is not the skimmed milk of a Jersey heavier than that of a Holstein or Durham? Is the skimmed milk of a cow nearly dry the same in weight as that of the same cow when she is fresh? Does food cut no figure in the quality of skimmed milk? Is it possible that all these conditions affect the quality of the cream, but have no effect on the cheese quality of milk? Mr. Bliss, you must prove this before we will believe it. It is hard at best to let go of an old practice that has served us long and well.

I must still insist that Mr. Bliss's pet theory of "currents" will "carry" butter down as well as up. A current, to use his own philosophy, "impels inert matter by external force," so to speak. I agree with him that no process of "creaming milk" gets all the cream. It would require the nicest chemical analysis to accomplish this, but at the same time there are few who appreciate the quantity of cream they daily lose by imperfect methods of setting milk. This, however, can readily be discovered by a few experiments in different methods of setting. Apply the test of number of pounds of milk to the pound of butter, and if Mr. Bliss does not always use the same quality of milk in his experiments, then how can he tell whether or not by weight his skimmed milk is always the same?

I think he makes a good point on Dr. Hoskins when he asks why butter-milk and skimmed milk should differ in quality if cream is only butter ungathered. This would be a very simple way of disposing of the butter question, but I fear the doctor is not the appointed man to settle this mixed question. There are a good many things in cream that even churning does not get out.

I cannot imagine how Doctor Hoskins ever got it into his head that any temperature, so it be "fixed," would get all the cream out of milk. This theory certainly has the merit of novelty. This is bringing us around to the incubating theories of egg-hatching, where a variation of two or three degrees in temperature sometimes raises more "Cain" than chickens.

The impossibility of this theory being correct will appear readily to the mind of the practical dairyman when he remembers that milk set in summer in thin sheets, so that it responds to the slightest change of the atmosphere, will throw up all the cream in forty-eight hours, while at the same time milk set in large, deep cans that hold the milk warm and at nearly a fixed temperature, yields but one-half or less the quantity of cream. There is no theory about this—it is a solid fact. The larger the body of milk, the less variation or change in temperature and the less the yield of cream. I would risk my neck before a jury of dairymen on that proposition. I cannot admit that the doctor has made such a discovery as he seems to think he has; but, under proper conditions, I think his fixed temperature theory is correct. If I could take the milk as soon as it comes from the cow, and by an instantaneous shock reduce the temperature to 33 degrees in a vessel with a small top to collect the cream, I would expect to accomplish better results than are now attained by any method of setting milk. My notion is that Mr. Bliss and Dr. Hoskins are both wrong in thinking that cream does not come up in shallow pans in winter. It does come up, but cream raised in a cold atmosphere is so thin that its consistency is little greater than skimmed milk, and it is, therefore, when spread out, in such a thin layer on top of the milk that it is very hard to secure and separate it from the skimmed milk below. It is a practical and not a theoretic trouble that meets the dairyman at this point. This is why I want the milk set in deep vessels.

The fixed temperature I want also, but it must be a very low fixed temperature if the milk is set deep. If it is set shallow, then I should want a fixed temperature of about 60, so that the cream would take on sufficient consistency to be easily secured and the milk be in so thin a layer that the cream could all get up before the milk got too thick to let it up.

These milk theories are interesting as matters of speculation, but, so far as I have been able to see, no practical good has yet come out of them. I am, however, still in hopes that some of these theorizers will do something.

About all I have been able to determine in my own mind on this subject, is that milk set in shallow pans not more than three inches deep and at a temperature ranging from 60 to 80 degrees, will in 48 hours throw up all the cream, while milk set in deep cans below 40 and above 32 degrees will throw up all the cream in 24 hours. These are, according to my experience, the strict limits within which milk can be handled to procure the best results in raising all the cream. Others, of course, claim wonderful results; but while there can be no earthly objections to men inventing systems of cream-raising, and also inventing theories for raising it or getting something else to raise it, yet there is a limit to the profit in this sort of thing to the dairyman. We have had pretty nearly as much theory as we want, but there is a dreadful poverty of facts to build on. We ought to know what the average quality of milk will do under all circumstances of heat and cold. These things could be tested and tabulated with comparative ease, if only some one of the hundreds who are paid by State and

nation to do it, would take the trouble to give us a little practical information.

I wish, with a view to this end, that Mr. Bliss would reorganize his challenge and bring it to a head, so that some practical good could come of it. There is a field for both fun and information in the substance of his suggestion.

SPECIFIC HEAT AND CREAM RAISING.

O. S. BLISS.

A FAITHFUL mentor, who, though he never writes, often criticises me pretty severely and thus renders me invaluable aid, insists that I shall not leave the discussion of "cream raising" till I have farther elucidated its relations to the doctrine or law of specific heat. I undertake the task thus imposed upon me with very great reluctance because the doctors have got into an almost inextricable muddle over it.

In the article of March 29th, which was the occasion of the preparation of my former contribution to the RURAL, it is said under the sub-head, "Law of Specific Heat:"—"For under this law when milk is rapidly cooled, the cream globules cool faster than the milk, consequently they would have a less tendency to rise, rather than a greater, as their greater condensation or contraction makes them relatively heavier than before the cold was applied. As it does in fact rise much quicker, those theorists who have been seeking for a motor power in aid of gravity to account for the observed facts, are at a non-plus in regard to the matter."

The Scientific Farmer for November 1878, in an article on the "Philosophy of Milk Cooling" says:—"It takes longer to cool down the milk whose specific heat is represented by 0.847, than the cream whose specific heat is 0.78, and, longer still the water, if the can contained water instead of milk."

A correspondent of the same paper for January 1879, commenting upon the above-mentioned article says:—"It is stated that if the water outside the can of milk were cooler than the milk, then the fluid portion of the milk 'would be cooled two degrees while the globules of oil were being cooled one degree.' But as the specific heat of oil is less than that of milk, exactly the reverse of this is true. The oil will cool two degrees while the milk cools one degree. This is correctly stated in the next sentence—'it takes longer to cool down the milk than the cream.' The cream therefore cools more rapidly than the milk. But this being the case, the cream, which at the beginning of the process is a little lighter than the milk, will, as the cooling proceeds, approach it in density (the more rapid cooling of the cream producing a more rapid specific gravity) so that as far as the agencies invoked in this explanation are concerned, cooling may be expected to prevent the rapid rising of the cream. Therefore the very reverse of what this article states is the truth." The editor accepts the "correction" and says:—"Bodies which have the greatest specific heat cool the most slowly. The specific heat of water being 1.000, that of milk is 0.847; that of cream is 0.780. Thus water cools slower than milk, and milk, than cream.

Specific heat is defined in the books as "The quantity of heat required to raise the temperature of a body one degree, taking as the unit of measure the quantity required to raise the same weight of water one degree." The relative quantities of heat required to raise cream, milk and water respectively one degree, according to the figures quoted above, are 0.780, 0.847 and 1.000. But absorption and radiation are reciprocal. Bodies radiate just as much heat in falling one degree in temperature, as is required to raise them one degree. We find, then, that under the law of specific heat cream radiates heat under a falling temperature, from any one degree to another, in the proportion of .780 to .847 as compared with milk, or 1. as compared with water, which is directly the reverse of the conclusions of the three writers quoted above. Tyndall in his lectures illustrates the principle involved, by a simple yet very striking experiment. He takes a cake of beeswax, half an inch thick, and from a vessel of hot oil places upon it balls of different metals. He says: "At present they all possess the same temperature, namely, that of the oil. I lift them out of the oil, and place them upon this cake of wax, which is supported by the ring of a retort stand; they melt the wax underneath and sink in it. But they are sinking with different velocities. The iron and the copper are working themselves much more vigorously into the fusible mass than the others; the tin comes next, while the lead and the bismuth lag entirely behind." Their specific heat in the order in which they stand above, is represented by the following numbers: 0.1138, 0.0952, 0.0562, 0.0314, 0.0308; the impression they make upon the wax exactly corresponds with them. The iron and copper go completely through the wax, while the lead and bismuth only sink a little way into it.

But neither time nor space is at my service, and I may not pursue the subject, though much more might well be said. I trust enough evidence is herein produced to establish the fact that, so far as the abstract principle of specific heat is concerned, so far is it from conflicting in any manner or degree with the theory of the cold setting of milk for cream raising, that it is in perfect accord with it. If the only principles involved were the radiation of heat in proportion to the specific heat of the respective bodies, and contraction followed in the same proportion, the increase in the specific gravity of the milk would be to that of the cream as 0.847 to 0.780, which would materially contribute to that "motive power in aid of gravity," so sneeringly spoken of by Dr. Hoskins.

The Herdsman.

A BREEDER'S OPINION OF DAIRY COWS.

WILLIAM CROZIER.

Marvelous reports of dairy successes; the Jersey; the Guernsey; the Ayrshire.

I HAVE just returned home from a short trip for the purpose of visiting farmers and breeders. It may be said: "This is not the time for a farmer to be away on a visiting tour; at this busy season he should be about the homestead taking care of his stock and farm work in general." This remark I believe, as a rule, to be just; yet we are all the better and wiser for investigating the work on other farms, and to me this seemed the best season for doing so. I have read and heard so much of late about wonderful crops, marvelous cows and other phenomena, that I was anxious to seek knowledge from those who had raised those wonderous crops, owned those cows and were the happy possessors of the other agricultural marvels. My search, however, has not been very satisfactory, so far as obtaining proofs of these wonders is concerned. So much has been said of the quantity and quality of dairy produce from some herds and of the high price obtained therefor, that nearly all who own a herd of milch cows have been worked up to fever heat to get a dash of some puffed-up breed in their yards. The expectations indulged in by some of these seem to me to resemble somewhat the musings of the milk woman who, while trudging along with a pail of milk on her head, thought that by sale of it she would gain double what it had cost her, then by-and-by she would buy a cow, and that cow would have a calf, and so her wealth would go on doubling yearly until she could ride in her carriage—all from that pail of milk!

We read of small herds that make 450 pounds of butter a year per cow, and that that butter sells for one dollar a pound! Why the owners ought to be rich in a short time! Just think of it—450 pounds of butter to a cow, none of it selling for less than one dollar a pound and some of it bringing as high as $1,25 per pound! Then the calves are selling for from $100 to $175 each, so that there's no end to the profits! Yet, strange to say, some of the noble, kind-hearted writers who are generously willing that the public should share their advantages "for a consideration," although they had the best of land under their control for 10 or 12 years without paying for it, would have been bankrupted had not the rich man's full purse been opened for their relief. They were from $12,000 to $14,000 behind, and yet they are still preaching to young men to follow their example.

For myself, I am a breeder and importer of Ayrshires, Guernseys and Jerseys. I have also tried the Dutch, or so-called Holsteins, but found it profitable to quit dealing in them. There are many good Jerseys and a great many more poor ones. When I say poor ones, I mean that many of them will not exceed the rate of half a pound of butter a day the year round. Many will make a pound of butter a day for the whole year, but it is not the very pretty-looking ones that will do this. To get such a one a man must select an animal with a good, large frame, an excellent feeder, and fine all over. By fine I do not mean fine-looking. Looks are nothing. The good cow has a fine countenance, a light neck, good withers, with full crops, well-spread ribs, deep naval, broad back; not backed like a fish, nor with little delicate hind-quarters; but with good, deep quarters behind, wide between the thighs with a fine set of limbs. Such cows well selected, will breed well and milk well; but, alas! beauty now-a-days counts high—far too high—in the selection of a cow, no matter how much or how little milk she may give.

Guernseys now seem to be much sought after by the rich men of the East, and they are running the Jerseys hard. There are a few good cows of this breed, with rich milk like that of the kindred Jersey. There is, however, no breed that can be compared with the quiet, little Ayrshire, and when the lassie calls Mollie she comes pleasantly, not to lick or play or be petted, but to give a good, large mess of rich milk, which will make butter or cheese or fill the milkman's pocket. She needs no "puffing;" she speaks for herself; she will not disappoint her owner. Ayrshires make excellent butter, cheese or beef, and for working cattle they cannot be excelled even by the beautiful Devons. Their milk is rich in quality, and large in quantity. They are easy keepers and in every way a most profitable breed of cattle, and wherever they find a home they become permanent favorites.

Suffolk Co., N. Y.

TREATMENT OF MANGE.—The half-bred Berkshire pigs are nearly all white. They became mangy when only a few weeks old. We tried carbolic soap, tobacco tea, lard and sulphur. We also washed them clean several times with soap and water. Each time we thought we had conquered; but in a few weeks the disease would break out again. In looking over the scrap-book we found a clipping from the RURAL of several years ago, in which the writer stated that outside applications were useless without some inside remedy. Finally, when our pigs were about four months old, we gave the six two tablespoonfuls of sulphur per day, for three days; then skipped three days and repeated the doses, in the interim making a thorough application of lard and sulphur to the surface, and now we believe the cure is effected, as two months have since elapsed and they are still clean and nice. The dog was afflicted with the mange, too. We treated him in the same manner, giving a teaspoonful of sulphur at a dose, and he is cured. M. B. PRINCE.

The Apiarian.

A GOOD MOVABLE COMB BEE-HIVE.

WHILE there are many forms of bee-hives, each one of which has its advantages and advocates, and while each one is good, still some have a greater number of advantages than others. These few are the hives which should be described in our various agricultural papers, and the readers left to exercise their own judgment in choosing what one they shall use. I trust I will be excused for selecting the Langstroth-Doolittle Hive, as the one to be described. Perhaps it is because it is my preference, or perhaps simply because I know it to be a good hive, and feel sure that every practical apiarist will succeed well with it.

The Manner of Using this Hive

I will describe as follows: In the spring or summer, whenever your bees commence gathering honey, place two cases, one above the other, on each side of the brood nest, placing the separation-side away from the partition; shove the followers up against these and key them up snugly. Examine the hives in a few days, and as soon as the bees have built out the combs and stored honey in these boxes, so as to be well started, move the cases away toward the ends of the hive, and insert two more between them and the partition, key them up again, turning the key flat-wise. As soon as these side boxes are nearly full and ready to ripen, raise them up to the top, resting the cases upon the strips of wood (Q), and place empty cases at sides. When the top boxes are capped, remove them, and raise the partly-filled side cases to their place, supplying empty cases at sides again. In this way, work all the hives. The empty boxes, are, of course, to be provided with starters of either natural or artificial comb. The reasons for raising the side cases to the top are: honey is stored, and comb built much faster at the sides than at the top, and honey ripens much faster at the top than at the sides. The boxes are, of course, to be removed as soon as filled. Toward the close of the honey season be careful not to put on too many cases, as the bees may be able to fill them all, and thus you will have a lot of unfinished boxes. For wintering, remove all cases, wedge the followers against partitions, pack the spaces at ends with chaff or cut straw, stuff the cap with long straw and put it in place; if then the entrance is contracted with the entrance blocks, the bees will generally winter well. Now as to the

Description of the Hive.

I have decided to give a list of the number and size of pieces, and this, together with the engravings will, I think, enable anyone to make these hives.

A—Two pieces, forming the front and back of the hive, 12 inches wide, 24 inches long, 1 inch thick.

B—Two pieces, 12 inches wide, 14¼ inches long, ⅞ inch thick.

E—Two pieces, 25¼ inches long, 8 inches wide, 1 inch thick.

F—Two pieces, 16½ inches long, 8 inches wide, ⅞ inch thick.

G—One piece, 27 inches long, 18 inches wide, ⅞-inch thick.

H—One piece, 25 inches long, 20 inches wide, 1 inch thick.

K—One piece, 25 inches long, 5 inches wide, 1 inch thick.

I—Two pieces, 25 inches long 3 inches wide, 2 inches thick.

D—Two pieces, 16¼ inches long, one inch wide, ⅞ inch thick.

C—Two pieces, 25 inches long, one inch wide, 1 inch thick.

T—End pieces, 30 pieces, each 6 5-16 inches long, 2 inches wide, ⅞ inch thick.

T 1—Top pieces, 15 pieces, each 12⅛ inches long, 2 inches wide, 3-16 inch thick.

T 2—Bottom pieces, 15 pieces, each 11⅜ inches long, 2 inches wide, 3-16 inch thick.

P—Two pieces, 17 inches long, 2⅜ inches wide, ⅜ inch thick.

S—Top bars, 9 pieces, each 13¼ inches long, 1 inch wide, ¼ inch thick.

S 1—Side bars, 18 pieces, each 10¾ inches long, 1 inch wide, ¼ inch thick.

S 2—Bottom bars, 9 pieces, each 11¼ inches long, ½ inch wide, 3-16 inch thick.

O—Two boards, 12⅛ inches long, 14 inches wide, ¼ inch thick.

O 1—Two cleats, 14 inches long, 3 inches wide, ⅜ inch thick.

R—Two boards, 11½ inches long, 4½ inches

R 1—Four cleats, 4⅜ inches long, 1 inch wide, ½ inch thick.

N—Two pieces, 12¾ inches long, 10¼ inches wide, ¼ inch thick.

Q—Two pieces, 14 inches long, 1½ inch wide, ¼ inch thick.

X—Tin, two pieces, 13¾ inches long, 2½ inches wide.

X 1—Tin, 15 pieces, 11¼ inches long, 5 inches wide.

W—Tin, one piece, 28 inches long, 20 inches wide.

L—One piece, 13½ inches long, 11½ inches wide, ⅜ inch thick.

M—Four pieces, seven inches long, 5 inches wide, ⅜ inch thick.

U—Sides, 60 pieces, 6¼ inches long, 2 inches wide and ⅜ inch thick.

V—Top and bottom, 60 pieces, 5 inches long, 1¾ inch wide, ⅛ inch thick.

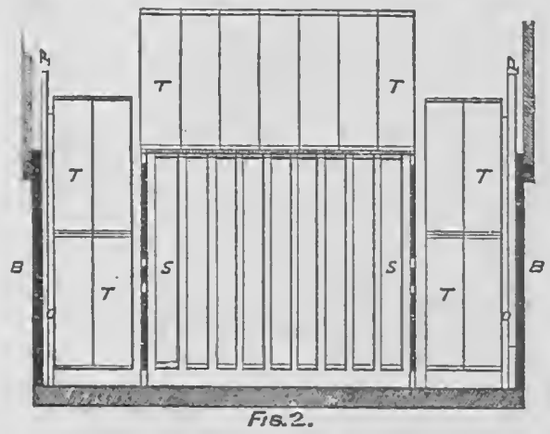

FIG. 2.

Some of the pieces are so placed in the hive that they cannot be lettered.

The complete hive is seen at Fig. 1—all except the entrance blocks—which are simply two hard-wood blocks, one inch square and seven inches long—are beveled back on one edge two inches, so as to guide the bees to the entrance.

A part view of internal arrangement is seen at Fig. 2. The brood-frame, at Fig. 6. The case, at Fig. 8. The slotted partition brood, at Fig. 3. The follower, at Fig. 5. The key, at Fig. 4. The small board that closes up the opening of the top cases, where they extend above the side cases, at Fig. 7.

To Put the Hive Together,

after you have cut all the pieces exactly the size given in the list, take the two pieces A, which are the front and back of the hive, and cut a groove across each end, five inches from the end, one-fourth of an inch square. The grooves are to receive the slotted partitions. Next, rabbet out the upper inside edges of these pieces, ⅜ inch deep and ⅛ inch back, the rabbet extending from one groove to the other. These rabbets are for the frames to rest in. Take the pieces numbered M, and nail one to each lower corner, so as to be even with the bottom and extend to the groove. Take L and nail it to the back, so as to come even with the bottom and be between the grooves. Cut out an entrance in the front, ⅜ inch high and 13½ inches long.

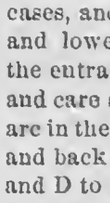

FIG. 3.

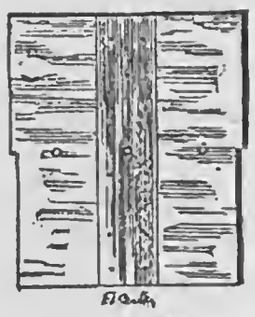
Now put the end of B to A, so as to make an oblong box. Slip "I" into the grooves until it is ¼ of an inch below the top of the hive, and then fasten it in place by nailing small blocks in the grooves below it. The slats in these boards should correspond with the spaces above the tin separators of the lower side cases, and the space between the upper and lower side cases. These slats are the entrances for the bees to side cases, and care should be taken to see that they are in the proper places. Nail C to front and back of hive, ½ inch from the top, and D to the ends of hive one-half inch from the top. These are for the cap to rest on. Now nail F to the ends of E, and nail G on top of this for the cap. Lay the sheet of tin W on top of this, and bend the edges down evenly and nail them with tacks to the edges of the roof. Nail H to I (I to be beveled off five inches back, as in Fig. 1), and nail K to I for the bottom and alighting boards.

Now to make the nine brood frames: Nail the top bar (S) to the ends of the side bars (S^1) letting the ends of the top bar project one inch beyond the side bars, and nail the bottom bar to the ends of the side bars, so as to have a frame $11\frac{1}{4}$x$11\frac{1}{4}$ inches outside measure. For



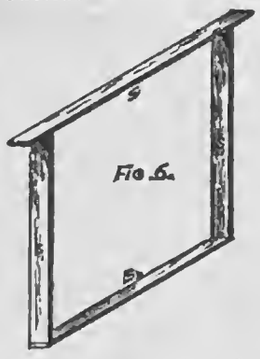


FIG. 5.

comb guides, fasten a strip of comb foundation, $\frac{1}{2}$ inch wide and $10\frac{1}{2}$ inches long, in the center of the under side of each top bar. To make the cases (T), nail the top bars to the ends of the side bars, allowing the ends of the top bars to project beyond the side bars, and nail the bottom bars to the ends of the side bars, so as to make a case $10\frac{3}{4}$ inches long and 6 5-16 inches high inside. The bottom bars of cases are to be cut out on edges nearly the whole length, so as to make them $1\frac{3}{4}$ inch wide and give entrance room for the bees. The tin separators (X) are to be nailed to one side of cases so as to be 21-32 of an inch from both top and bottom.

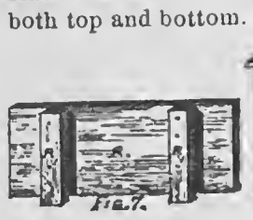

FIG. 7.

FIG. 8.

To MAKE THE SECTION-BOXES (U), nail the sides to the ends of the top and bottom bars, so that the sides will project $\frac{1}{8}$ of an inch on each side of the top and bottom bars. Two sections are pushed inside of each case,

To PUT THE BOXES, ETC., IN PLACE, now that the hive is all made, proceed as follows: Hang the nine brood frames in place in the middle space, or brood nest, and lay the strips (Q) on top, one at each side of the hive so as to cover the ends of the top bars. Hang two cases at each side, on the rabbets—I forgot to say that these cases all have two nails, driven through the top bar into the side bars of each; they should be driven close to the side the tin separator is nailed to, and should project above the top bar $\frac{1}{4}$ of an inch, so as to avoid crushing bees when the upper tier of cases is placed upon the lower—set two, at each side, on top, turning the side of the cases having the tin separators on away from the partition. Place seven cases on the top of hive, resting on the strips; they will just fit between the tops of side cases. Put the tins (X) between the top and side cases, the ends of tins resting on top of sides of hive, so as to prevent the bees from bridging the combs across. Put the followers in place at sides—they should have been previously fitted and cleated as in Fig. 5, so as to come within $\frac{1}{8}$ of an inch of bottom board. Push down the keys (P) at sides, and these will wedge up the cases snugly in place. Place the little boards (R) in place at the opening caused by the top cases extending above the side cases. Now the hive is complete. This is the hive used by Mr. G. M. Doolittle (the inventor, in part) with such great success, and the one that is regarded favorably by many of our best bee-keepers.

APIARIAN.

Entomological.

PARASITES ON DOMESTIC ANIMALS. No. 4.

PROFESSOR A. J. COOK.

Spider-ticks and Mites.

Some of you will remember an old-time disease, happily very rare in our times, which, as surely as the traditional peck of dirt, would come to make its seven years' sojourn, not only in the best of families, but as the guest of the fairest. This disease, very appropriately christened the itch, of those—ought we say "good old times?"—was caused by the irritating presence of a wee animal, the itch mite. A near relative causes the mange, or scab, of our domestic animals, which are more polite terms of the same thing, the itch. The "red spider" or "red louse" of our poultry houses and the large wood ticks, whose bite is so painful to ourselves and the lower animals, are also near congeners.

Order Arachnida, or Spiders.

These tormenting pests are not insects at all, but belong with the spiders. They have only two divisions of the body, head and abdomen. Their eyes are simple; they are without antennæ, and when mature always have eight legs.

Sub-Order Acarina.

The mites (Fig. 6) have rounded, non-articulated abdomens, can suck as well as bite, while many have at first but six legs.

The habits of mites are very varied. Some, like those in question, are parasitic; others, like the wee red spider, are very destructive to plants on whose juices they subsist. Still others, like the cheese and sugar mites, are destructive to the articles which give them their names. They are often met singly and as often in great numbers. A lady of my acquaintance has been much annoyed of late by noticing myriads of these minute creatures upon her windows.

Ixodes (Ticks)

The largest of these animals are the ticks, which are often found on cattle that feed in the woods. Nor do the "wood ticks" confine their blood-thirsty attacks to our domestic animals, as many of us well know by painful experience. Often, as a boy, did I have to pay a painful penalty for those delightful strolls in the grand old forests, laid on by one of these same ticks "Ixodes unipunctata, (Packard.) One feels the darting pain and upon immediate examination finds the cruel tick deeply buried, and so firmly anchored that the attempted liberation tears the head from the body. As a lad I wondered at this firm hold, but as I came to know the structure of the mouth organs, I ceased to wonder. Both their jaws and their glossoid or tongue are covered with teeth, each of which takes hold to prevent the extraction of its possessor. The ticks at first have but six legs. They are not enough of a pest in the Northern States to warrant a further consideration at this time.

Mites.

The red mite (Fig 6) which attacks our poultry in such alarming numbers, is the Demanyssus gallinæ. It is soft-bodied, oval in form, and, though very small, is from its crimson hue easily discerned without a microscope. The young have only six legs. I have found by actual experiment that they could inflict quite a painful bite even upon our own persons. I have reason to believe that they may cause horses much annoyance, when the horse stable and hen roost are one and the same. The ointment made of sulphur, lard and kerosene works a speedy cure of this evil among the poultry. I have no doubt but that this same ointment or the kerosene-wash would rid larger animals if attacked by these Lilliputian pests. Other species attack turkeys, pigeons, and even the cage birds of our houses.

FIG. 6.

HEN-MITE MAGNIFIED.

The mange in horses is only another term for itch. It is caused by a small but visible mite, the Dermatophagus equi, which often swarms on horses. The D. ovis causes the scab in sheep, while the D. bovis affects in like way our cattle.

Remedies.

I have already given the cure recommended by Prof. Law for these pests. I presume the kerosene-wash, made quite weak, would also be effectual. The ointment made of kerosene and sulphur would certainly be a good remedy.

The itch mite, Sarcoptes scabei, (Latr,) is so small as to be almost microscopic. It lives, feeds and reproduces its kind in small, subcutaneous galleries which its own feasting prodnces. As a consequence of the intolerable itching and the incessant irritation, disgusting pustules are formed, which are not things of beauty or joys forever.

A still smaller mite, the face mite, Demodex folliculorum, (Owen,) lives in the pimples, or diseased follicles about the chin and nose of the human face.

For all the parasites I have referred to, Prof. Verrill recommends a solution of sulphuret of potassium, two to four ounces to the gallon of cold water, varied to suit the character of the skin of the animal to be treated.

Farm Economy.

FARM HELPS.

ONE of the easiest made, and most useful implements on the farm is the stone boat; the accompanying sketch shows one that anybody can make. The writer had for several winters charge of from forty to fifty head of cattle that were fed on cut feed, and one or two hundred pigs for which the feed was all cooked.

FIG. I.

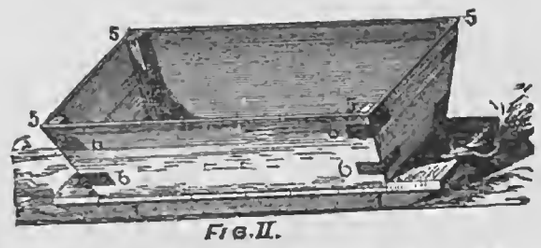

FIG. II.

The cattle and pigs were in two or three different buildings, and one hundred feet or more from the cutting-box and swill-cooking room. A stone boat like the one represented in the sketch, was made and loaded with barrels of the cooked food which were thus drawn along in front of the pens and dipped out into the troughs. For the cattle a box, like fig. 2, was made to set on the stone boat drawn up to the pile of cut stalks, hay, etc., shoveled full, then drawn along in front of the cattle and shoveled into the mangers.

The stone boat has solved one of the hardest problems in the question of feeding cattle cut feed. The necessity of having the cattle, the feed to be cut up, and the cutting box near together, is in some measure obviated by the use of the stone boat and box. With these it takes but little longer time to feed cattle cut feed or roots, and pigs swill, scattered around in different places, though they are some little distance apart, than if they are near together. The boat and box were also used to draw out the manure. It is less work to draw out the manure from the stable in this way and to have it left in a snug pile in the yard, than to throw it out of a door or window; thus exposing it to the drippings of the roof, to say nothing of the rotting of sills and boards where the pile rests against the barn. The box being narrower at the bottom than at the top, can be easily tipped over, and then lifted off from the manure and set back on the boat.

The stone boat for ordinary use (Fig. 1) is made as follows: For the runners 1, 1, take any hard wood 4x4 or 4x5 inches, and seven feet long, chamfer off the ends, on the lower side, and across each end on top, nail a piece two feet long, nine inches wide, and $1\frac{1}{2}$ or two inches thick, (Fig. 1, 2, 2), of hard wood. Through each end of the cross pieces and of the runners put a $\frac{3}{4}$ bolt, shown by the dotted lines, 3, 3, with the head let up into the runner, and the nut on top. The other boards are one inch thick nailed on; if they break they can be easily replaced. Round poles for the runners, with the upper side hewed flat, answer the purpose as well as planks. The hitching irons at the ends 4, 4, can be made of old iron by any blacksmith, for 25 cents for the pair. They are fastened on with four bolts. In place of the irons a two-inch hole may be bored through the plank for a chain to pass through.

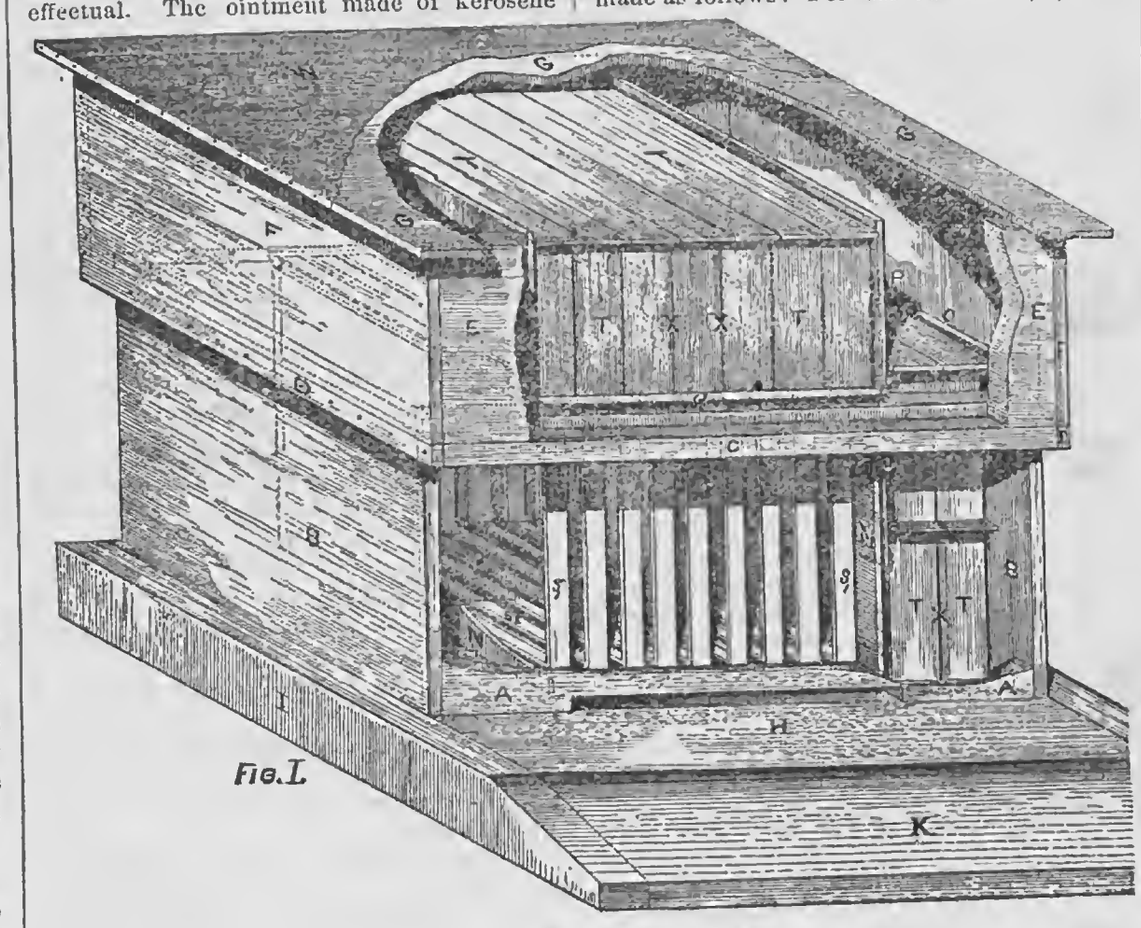

FIG. I.

LANGSTROTH-DOOLITTLE HIVE.

The box, (Fig. 2), is two feet wide and five and one-half feet long on the bottom, and three feet wide and six and one-half feet long on top. It is made of three-quarter-inch soft, or one-half-inch hard wood, the corner posts, 5, 5, are two inches square and of hard wood to hold the nails. The pieces outside, 6, 6, to hold the corners from drawing apart, may be cut out of an old stove-pipe, and put on with small nails. One board is left off from fig. 1 to show the runners.

F. A. GULLEY.

Mich. Agr'l. College.

Miscellaneous.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 26.—MAY 16, 1879.

Fertilizer Analyses.

258. Stockbridge Onion Fertilizer. Sold by Hubbell & Wakeman, Saugatuck. Sampled and sent April 19, by T. B. Wakeman, Greens Farms, Ct. Weight claimed and found 200 lbs. per bag.

269. Raw Bone. Manufactured by J. O. & E. Smith, Canterbury, Ct. Sampled from stock of Charles Backus, Andover, Ct., April 28, by John S. Welles, Hebron, Ct. Weight of bag 194 lbs., weight claimed 200 lbs.

	258	269
Nitrogen	3.91	4.07
Sol. Phos. Acid	5.73	
Reverted Phos. Acid	.63	20.40
Insol. " "	.13	
Potash	8.32	
Chlorine	18.99	
Estimated value	$38.77	36.94
Cost,	50.00	30.00

263. Sulphate of potash, containing 75 per cent. of sulphate or 41 per cent. of actual potash, by analyses of Drs. Ulex and Gilbert.

264. Sulphate of potash, 55 per cent.

265. Muriate of potash, containing 80 per cent. of muriate or 56 per cent. of actual potash.

The above potash salts are imported and sold by the New Haven Chemical Co., and were sampled by J. J. Webb, April 26.

	263	264	265
Potash	37.21	27.44	48.20
Sulph'c acid	9.77	7.21	
Chlorine	36.07	37.24	
Soda		12.05	
Lime		1.44	
Magnesia		4.79	
Inso'ble in water		3.85	
Water, by difference		14.37	
		108.39	
Deduct ox. equivalent to chlorine		8.39	
		100.00	
Cost per ton	$35.00	$29.00	$35.00
Cost per lb. potash	4 7-10c	5 3-10c	3 6-10c

The above figures express the percentages of potash, sulphuric acid, etc., as found in the analyses. In case of 264 the analysis was made complete, and thus exhibits the quantities of all the ingredients present. Since, however, potassium, sodium, and magnesium are partly in combination with chlorine instead of oxygen, stating them as potash (potassium oxide), soda (sodium oxide), and magnesia (magnesium oxide), makes the footing exceed 100 by an amount of oxygen chemically equivalent to the chlorine present (8.39 per cent.), which is therefore deducted.

In the following statements are given the percentages of the several compounds that do or may actually exist in the samples so far as the analyses enable us to calculate them. Only in case of 264 is the analysis sufficient to make the statement complete.

	263	264	265
Sulphate of Potash	21.27	15.70	
Muriate of Potash	40.69	30.01	76.35
Common Salt		26.63	
Chloride of Magnesium		11.38	
Chloride Calcium, etc.		1.92	
Water		14.37	
		100.00	

Reckoning all the potash in 265 and 264 as sulphate, we would have 68.80 per cent. and 47.80 per cent. of sulphate, respectively, instead of 75 per cent. and 55 per cent.

Of the 37.2 per cent. of actual potash in 263, only 11.5 per cent. can exist as sulphate, while 25.7 must exist in the form of muriate. Of the 27.44 per cent. of actual potash in 264, but 8.5 per cent. can be present as sulphate and the remaining 18.95 per cent. is in the state of muriate.

We observe that the amount of potash actually existing in these samples, as received at the Station, is several per cent. (4 to 8) less than claimed by the dealer.

The dealer's guarantee is based on the analyses of the Hamburg chemists, and the deficiency may be fairly attributed to absorption of moisture during or since importation.

We notice again, that the samples 263 and 264, sold as sulphate of potash, contain less than one-third of their potash as sulphate, and more than two-thirds as muriate.

Sulphate of potash is therefore a trade name, and, like many other trade names, involves a fiction more to the advantage of the seller than of the purchaser. The notion is prevalent that sulphate of potash is a better fertilizer than muriate of potash. Some experiments have been published going to show that potatoes and tobacco raised with sulphate are of better quality than when raised with muriate. Whether this be the fact generally, may well be doubted and since these samples of "sulphate" both contain more chlorine than enough to make a muriate of all the potash, they cannot be expected to make better potatoes or better tobacco than a pure muriate.

We see, finally that the cost of potash in the high grade muriate is considerably less than in the sulphates; evidently, therefore, muriate of potash is the cheapest source of potash. The common salt chloride of magnesium and water which make up more than half of 264, and more than one-third of 263, have no commercial or agricultural value corresponding to their cost. S. W. JOHNSON, Director.

"THE RURAL" CORN PREMIUMS.

[WE are daily in receipt of so many inquiries regarding our Corn Premiums and the prescribed method of cultivation, that it has become necessary again to publish the gist of what was published at length in RURAL of April 26.]

Conditions of Cultivation.

Any fertilizer or manure may be used in any quantity. The method of cultivation is optional with the cultivator. Our only restriction is that the area planted be WITHIN *one-fortieth of an acre*. We have kept an account of the *average* number of kernels sent out to each applicant. In each package there have been unsound kernels. These may, of course, be rejected. But *the exact number of kernels* (whether 125 or 145 or any other number) *planted*, must be stated in the statement of results obtained.

It will be well for each contestant to provide himself with *proof* of his entire proceeding, such as the evidence of a Justice or other competent authority.

We shall want to know the *quantity* of shelled corn and its *weight* produced from our seed, the weight of fodder, average number of ears to stalk; what kind of fertilizer was used, if any, the distance between rows and plants, time of planting and mode of culture. When these statements shall all have reached us and been carefully examined and compared, we shall announce the distribution of the following premiums:

Prizes.

No. 1. $100 in gold given by the proprietors of THE RURAL NEW-YORKER for the yield that shall have most successfully fulfilled all the conditions, and attained the highest general average of points.

No. 2. A FEED AND MEAL MILL (value $65), given by the CHALLENGE MILL CO., of Batavia, Ill., for the yield that is next in order.

No. 3. The Improved BIG GIANT FEED MILL (value $45), contributed by J. A. FIELD, SON & Co., St. Louis, Mo., for the third best result accruing from the competition.

No. 4. The "VETERAN" CORN SHELLER (value, $35), made by the SANDWICH M'F'G Co., of Sandwich, Ill., and given by them as a prize for the fourth best result.

No. 5. The WHEELER & MELICK Co., of Albany, N. Y., give a choice of their La DOW'S PULVERIZING HARROW, of a two-horse Disc CORN CULTIVATOR (value, $30), for the fifth prize.

No. 6. For the yield of corn, sixth in order of merit, MESSRS. RUMSEY & Co., of Seneca Falls, N. Y., offer a choice of anything from their catalogue to the value of $25.

NOS. 7 AND 8.—TWO HAND CORN-SHELLERS (value, $5 each), donated by LIVINGSTON & CO., of Pittsburgh, Pa., for the seventh and eighth best results from the Corn Distribution.

Farmers' Publishing Company.

1. For best weight of Shelled Corn per bushel, to be weighed three months after harvest, 30 vols. of Harper's Half-hour Series.

2. For second best, Dicken's Works, in 19 vols., (D. Appleton & Co.)

3. For third best, books from Scribner's Catalogue to the amount of $5.

4. For Fourth best, The Wilson Series of Agricultural Works, in cloth.

5. For fifth best, one year's subscription to the RURAL NEW-YORKER.

6. For sixth best, Miles' Stock-breeding.

Total value not less than $30.

All who intend to compete for the above premiums must give us notice of their intention so to do before August 1st, by postal card or letter.

EFFECTS OF THE PAST WINTER UPON TREES.

ONE of our most experienced arboriculturists writes us as follows: "Copious notes might be made about the severe winter-killing, or spring-killing, of 1879. The devastations of the season develop more and more. American Arbor-vitæs have died by thousands, and Irish Junipers in still greater numbers. Yews are browned but never killed. Hemlocks look badly, smitten very often to death. Some Silver Firs also are gone, but the Nordmann's Silver Fir stands grand and unscathed. The same is true of Piceas firma, compacta, Weeping Hudsonica, Pichta and Silicica. To tell the truth, I am sick of common evergreens—deciduous shrubs and trees for me, intermixed with a decided minority of choice evergreens. Pines have generally behaved well, especially Massoniana and Massoniana variegata (Sunray Pine), but then Pines are such unsatisfactory things to transplant, and people are so idiotic about buying *large plants*. In fact, the desire for immediate effect by the setting up of great specimens, which are destined to be stunted or die in a few months or years, is the curse of lawn-planting. People will be idiots, and think that the ways of Nature—that is, of God—can be traversed by means of gold."

The Poultry Yard.

THE BEST FOWLS.

IN settling this question more things are to be considered than number of eggs.

(1.) Eggs, their weight and number.

(2.) The hardiness of the fowls.

(3.) The quality of the fowls for table use.

(4.) The habits of the fowls as to strolling and scratching.

(5.) Their ability to endure confinement.

(6.) Their shape and color, or their beauty.

(7) Their domesticity, which involves also their tendency to "steal nests."

(8.) Their quality as sitters and mothers.

For No. 1, we may set down as among the best the White Leghorn, Plymouth Rock, Brahma, Houdan.

For No. 2, next to the old barn-yard fowls, we class the Asiatic breeds, and as less hardy the European stock.

For No. 3, the very best is the Plymouth Rock, which is a sound, solid meat bird. The Brahma runs too much to fat, but is heavier on the average than the preceding. The Dorking is also a good table fowl, especially when crossed with Brahma.

For No. 4, all light-built, long-legged birds, like Black Spanish, are in three or four places at the same time, rendering themselves very troublesome to a gardener.

For No. 5, we know that Brahmas and Plymouth Rocks, although quiet fowls, are not able to endure close confinement. It will stop their laying very quickly. Hence, as hens are sometimes cared for, these breeds make poor winter layers.

For No. 6, we should class the Dominiques, Plymouth Rocks, Black Spanish and Leghorns as especially handsome.

For No. 7, The Brahmas are incomparably best; Plymouth Rocks next. Dorkings crossed make also a good home-keeping fowl.

For No. 8, There is nothing to equal, considering reliability, persistency and light weight, the little old-style top-knots. The Brahmas vary exceedingly in this respect, but, like Plymouth Rocks, are generally very persistent.

All things considered for eggs, table, beauty and domesticity, give us the Plymouth Rocks. They are not voracious, lay on flesh with remarkable ease and in a fine style. There is no waste about them in the line of legs, wings, necks, feathers. They are hardy, but dislike confinement. Their eggs are large and in wonderful supply.

Considering number of eggs alone, the Leghorns and Houdans excepted, the mongrels generally raised by farmers, surpass the fancy or pure breeds. A farmyard generally shows a cross of Spanish Dorking, Brahma and one or two more stocks mixed with old style dunghill fowl. These are good layers and frequently exceedingly pretty. E. P. POWELL.

Industrial Implements.

A WIND-MILL FROM NEW DESIGNS.

CUSTOMARILY improvements on existing machinery are in the line, or follow the general plan of the original, but the Myers Windmill, made by the Silver and Deming Mfg. Co., of Salem, Ohio, is quite novel and an interesting study. Our illustration shows the mill out of gear. The regulating vane, here depicted, is again under the control of the smaller vane poised at one end. The vane lies directly in front of and across the wheel, which stands behind the mast—a decidedly new departure. When at work, or in gear, the main vane lies horizontally, presenting no surface on which the wind can act, but the little regulating vane takes its full force, standing erect until the wind over-balances the iron ball weight, when the regulating vane is turned forward and by a connection turns the main vane against the wind, and the wheel is thrown out of gear where it remains until the decreasing wind allows the ball weight to right itself, when the above-described operation is reversed and the wheel again revolves. The operation is very simple and automatic, but the same result may be brought about from below and the wheel held from revolving, by a brake.

The wind mill is constructed lightly, but very strongly, wrought-iron pipe being used in place of solid iron bars.

The balance is particularly adjusted, so that the mill stands in equipoise on the mast in any position. The engine, pump, etc., are fitted with all the mechanical skill the circumstances demand, and the best pumps and material, are used. Circulars giving dimensions, and particulars may be had on application.

THE LION RAKE

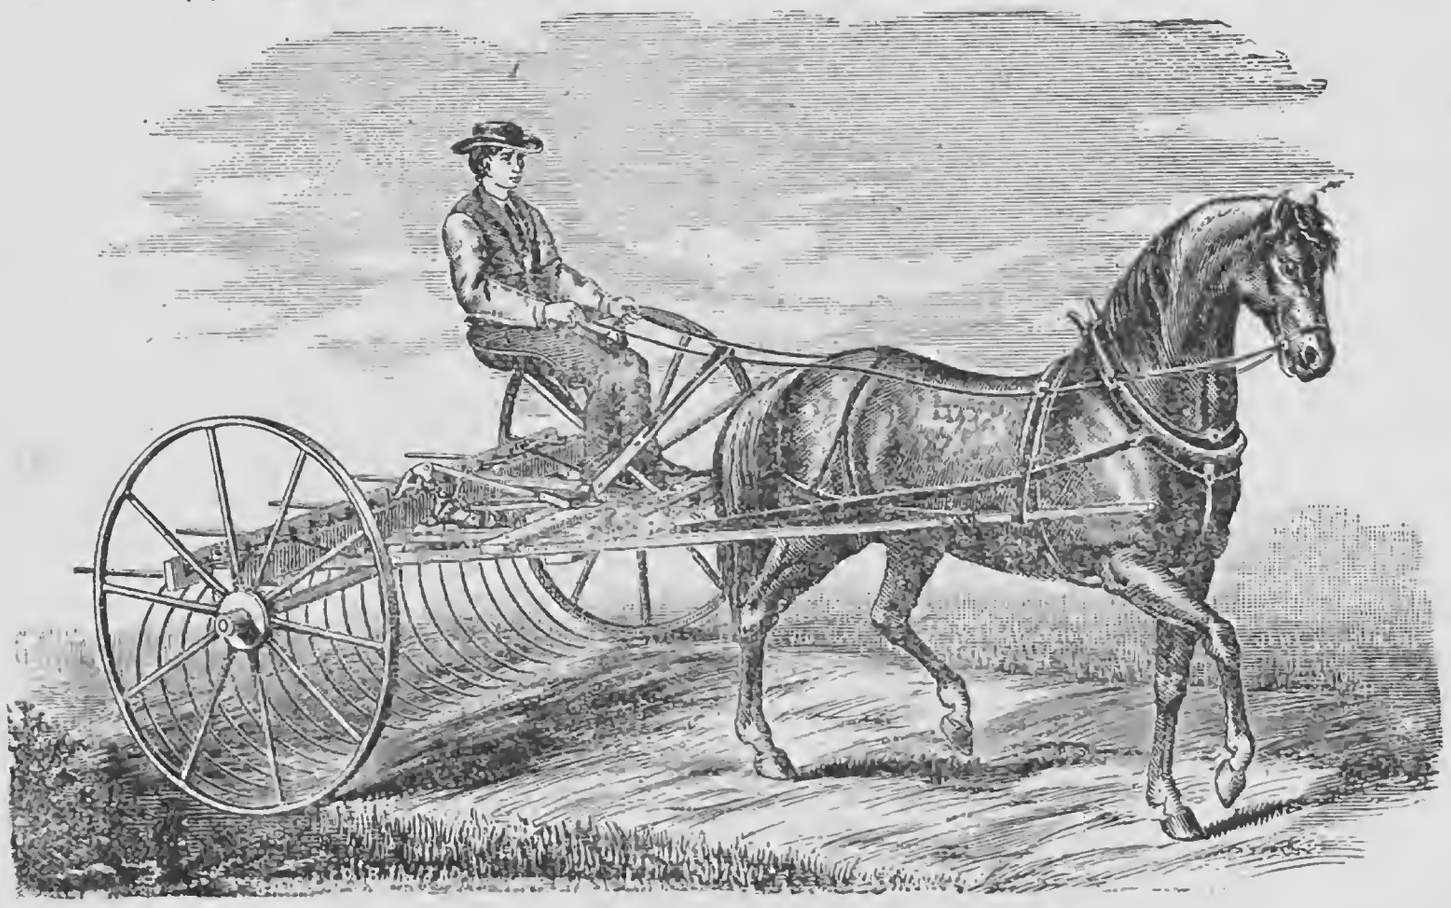
IS a new self-operating sulky rake made by A. W. Miner & Co. Belmont, N. Y. Its success has been very flattering, and we are told that at the present time the factory is running on double time, with something like orders for one thousand rakes in arrears. Following our habitual practice, we here epitomize the claims made on behalf of the implement, that our readers may be kept informed of everything that is new.

The chief characteristics of the "Lion" are simplicity, combined with durability and ease of operating. A double crank and two independently-acting clutches elevate the teeth in a way to withstand severe strains. This lifting device is said to be proof against damage by an accidental throwing the clutches into gear while the teeth are falling. The gathered load is discharged by pressing the foot upon a pedal conveniently placed; the horse completes the operation. A slight pressure is enough to hold the the teeth firmly to the ground when "bunching" or raking large windrows. The action of the teeth is quickly responsive to the motion of the driver's foot, and being articulated in iron holders, and shaped so as to insure running smoothly over the ground, the hay is neatly carried instead of being pushed along. The teeth are elevated by both wheels; the axle is above the center of the wheel, and the rake is adjustable to large or small windrows. The twenty steel teeth are oil-tempered, and there is an entire absence of ratchets, pawls, gears and springs in wheels, and similar minutiæ. The rake dumps from the center, avoiding side-draft. The construction is thorough.

THE COMBINED "CLIMAX"

THE Gibbs and Sterret Manufacturing Co., have made notable improvements in their "Climax" machines and this season will offer a changeable speed mower in addition to a center-cut self-rake reaper attachment which, applied to the mower makes a serviceable reaping machine. The advantages of a quick and slow motion for grass cutting are appreciated by any one having had experience in heavy or light grass; and to have these qualities combined in one machine, and under the control of the operator is no slight benefit. The changeable speed is produced by a shifting lever sliding a clutch to the left or right, while moving the same lever to position in the center throws the machine out of gear entirely. The whole operation is performed in a moment and without stopping the mower.

The Self-rake is a combination of improvements. The center cut may be attached to any of the Climax mowers. The cut being in the center, attaching the pitman to the knife by a rocking-bar, enable the driver to, at all times, watch the cutting apparatus. The driving chain is done away with altogether, the rake being driven by a universal coupling joint connecting directly from the axle of the mower to the bevel gear on rake head. The motion produced by this device is very steady and regular. The center cut, universal coupling joint, and changeable speed are the main improvements. Minor excellencies, such as enclosing the gears in boxes and having all adjustable parts fitted with mathematical accuracy, so as to insure smooth working, strength and durability can only be fully appreciated after a trial.



IMPROVED "LION" SELF-DUMP SULKY HAY AND GRAIN RAKE.

Everywhere.

RURAL SPECIAL REPORTS.

KANSAS, Parsons, May 17, 1879.—In about a month the sun will take the back track, and yet we learn, that in the Northwest, it is freezing nearly every night. Our weather as regards temperature, has not differed from the average season, say 50 to 80 deg. during day; but till this evening, we have had 20 days of dry weather. Turnips, peas etc., and even apple trees were beginning to show the yellow leaf, but 1¼ inch of rain which has just fallen will set things going for three weeks. The fruit trees were suffering from the scant rainfall of the last nine months—nine inches—the spring rains not having reached their roots, excepting partially. There never has been a better season for planting, and it has all been done two or three weeks. Corn is a good stand and is up as high as a foot in a few cases. Most of it has been cultivated once. There is what *I* consider an inveterate prejudice amongst many of our farmers against pulverizing the ground. I do it as thoroughly as I think necessary, and they laugh at me, saying if there come a rain, it will be all paste and bake hard. Probably it would, perhaps I might more properly say *possibly* it would, but in that event could not I break that cake with the cultivator? I have never seen our soil bake, if attended to as soon as it was dry enough to stir, and if it be absurd to make the soil fine, why then I suppose the more and bigger the lumps, the better. Now, could you raise onions or lettuce or radishes amongst big lumps? If the lumps in these cases prevent germination and growth, would they not also, to a great extent at least, prevent the germination and growth of corn, beans, etc? But if it were true that pulverization will sometimes cause a failure to germinate by reason of a big splash of water, are we to *every* time risk our seeds by throwing them on lumpy ground? Still, the best argument I can adduce is for them to examine my ground and my crops. If my plan fails to secure as good crops as other plans, then my plan is a wrong one. At present I feel eminently satisfied and am content to be placed with those who laugh *best* because *last*. The weather has been favorable to wheat, but I find the crop is extremely irregular, but the men who use harrows and rollers and strong horses are the men who have the good wheat. Corn is a good stand and the acreage is unprecedentedly large. We have been using lettuce, radishes, turnips and onions two or three weeks—all raised on the open ground. We shall have early peas in three days and early potatoes in ten days. Our fruit seems nearly a total failure, consequent upon the branches being encased in ice three weeks in December. Rye and wheat have been headed out two weeks. Our village is prosperous, the population (3100) increasing 20 to 25 per cent yearly.

J. B.

NEW YORK, Clyde, Wayne Co., May 19th.—The weather up to May 10th was very cold and backward. Snow storms occurred all through April, and a little snow as late as May 2d. Almost every night the thermometer stood below 40° up to May 9th, on which night we had our latest frost. Very warm growing weather began with May 10th. When the tillers of the soil quit work Saturday night, nothing hindered their eyes from long stretches of vision, except the naked forests on the hills; but when Monday night came, the foliage had leaped from every branch, so that the wooded hills had become grand bulwarks of verdure, the swamps jungles impenetrable to the eye. As it were in a day, we find ourselves suddenly hedged with walls of foliage into a little separate world.

The Burlington Hawkeye's late account relating to the sudden changes in central N. Y., whereby a man was sunstruck right at the end of a snow storm because he couldn't get his ulster off quick enough, was somewhat overdrawn. However, after cold weather with snow and frost up to the 11th, the 12th, 13th and 14th were days in which the heat was very severe, the thermometer reaching 98° in the shade every day. Imagine how near it came to a sunstroke to the young barley and oats, just beginning to deck the fields with green, also remembering that we have had no heavy rain storms this spring and the ground is very dry. Who could expect to see the plants stool out on thinly-clad wheat lots in such weather, when the dark-green blades turn yellow. How the fine-wools panted and the fowls of the yard held out their wings and parted their bills! but to-day the welcome rain came in torrents, and all nature smiles.

The Pear, Plum, Cherry, Grape, and rarest and best of all, the Peach, are loaded with blossoms throughout Wayne Co. From present reports and indications, apple orchards will not blossom very abundantly. Wheat in this locality is good, though a small growth in autumn illy fitted it for winter. No spring grain was sown before the 20th ult. Some had not sown a kernel by May 1st. Perhaps there are three pieces of corn planted in all this vicinity now; but few are ready to plant, and some have not struck a furrow for corn ground. Clover is thick on the ground and fine. That sown this spring caught well. Wheat, $1; potatoes, $1; corn, 40c.; butter, 10c.; eggs, 8c.; day's labor, 50 to 75c.

W—X.

FLORIDA, Fort Meade, Polk Co., May 19th.—The farming interests of this part of the country have been kept in the back-ground, owing to the fact that stock-raising has been all the rage. Of late there has been more attention given to agricultural pursuits, which I feel confident will prove very remunerative to those who push ahead in their chosen calling. We have lands here that will equal those of almost any part of the State, if not of the United States. Our seasons are such that we can plant something every month in the year. The principal crops that are grown here are: corn, oats, sugar-cane, peas and sweet potatoes. Stock of every kind do well with us. It is truly a poor man's country; the remark is often made among us that a man coming here poor will never have enough at one time to pay his way out of the country. However, this only a saying, for those who try, will of a certainty have everything that heart can wish. Having twelve months in which to work, with a soil and climate unsurpassed, it would be hard for a man with common industry to fail in having every necessary of life. We need here more rapid transportation to give us direct communication with the outer world.

L. S. M.

WISCONSIN, Pleasant Hill, May 12, 1879.—We have had a refreshing rain just in time to save the wheat and grass from injury. Farmers began to plant corn on the first of the month, and are still at it. There will be a large acreage this year. All crops look well, farmers are beginning to pick up a little and improvements are apparent everywhere. This is a healthy climate, and we have good soil, good farms and good farmers in the main, but not enough of them. I have noticed that those who get discontented and go to Kansas from here, in nine cases out of ten come back again, penniless and satisfied. Fall wheat yields as high as 40 bushels per acre here, corn 60@80 bushels per acre, oats 50 bushels. Prices at present are, for wheat, 85c.; corn, 35c.; oats, 15c.; potatoes, 50c.; day laborers, $1; by the month, $14. A good crop of small fruit is promised. Roads are in fine condition.

J. H. F.

NEW YORK, Pittsford, May 15.—After three weeks' drought, a rain has greatly enlivened vegetation. The crops which have suffered most from the drought are grass and wheat. Both will be light this year. Much wheat was injured by the severe winter, and the drought, since spring opened, has been very injurious. Oats and barley have been well got in, though fully two weeks later than last year. Fruit promises fairly, and even Peaches are in full bloom. This is the off year for Apples, and the crop will not be large. Preparations are being made for an unusually large potato planting, the high price last fall and this spring producing its usual result. Good potato seed is scarce, and much inferior seed will be planted. Herein lies one possible cause of another light potato crop.

W. J. F.

ALABAMA, Gainesville, May 18.—For over 40 years I have been planting Black Millet for feeding milch cows and calves. It is the best feed in this country—better than Pearl Millet. It can be cut three or four times in the spring and summer, and it will continue growing until frost. When cured, just before the seeds ripen, cattle eat it greedily. The seeds are the best food in the world to make hens lay. With regard to Prickly Comfrey, I can't find any animal in this country that will eat it. Geese will eat tobacco; but will run noisily off if you throw them Comfrey. I tried to persuade a cow to test it, but after eating two leaves out of the three I handed her, she indignantly "made for" me and chased me out of the yard and all the other stock therein seemed to get "mad" by sympathy and threatened to tear the place to pieces.

W. M. L.

TEXAS, Caldwell, Burleson Co. May 13.—This is our busy month. Grass in the corn; grass in the cotton; grass on the brain! Oh! what shall the harvest be? More help and better help is the cry now. My corn is tasselling; cotton is forming squares to bloom. My neighbors are cutting wheat; oats are nearly ripe; several are laying by corn. A great many farmers will have green corn in three weeks from the field. Garden corn will be fit for the table in ten days. Peaches and watermelons will be on hand in two weeks. Millions of large, luscious dewberries all over the woods and prairies are ripe now. The grass is just jumping out of the ground. Since the 22d of April we have had rain in superabundance, nearly ruining the cotton.

D. H. H.

MICHIGAN, Dayton, Tuscola Co., May 14.—Fine weather, although very warm—thermometer for three days past has ranged from 85 to 90 degrees above zero. Fruit of all kinds looks well. The prospect is fine for an abundance of all sorts, except of wild raspberries and blackberries, which were killed by fire. From these hundreds of bushels were marketed yearly. Crops of all kinds, on an average, are good. Plowing and planting corn and potatoes are the business of the day.

E. W. G.

MICHIGAN, Adrian, May 21.—Spring, cold and backward. Wheat is looking fairly. Last year our wheat hereabouts yielded from 30 to 40 bushels per acre, but we hardly expect to do quite so well next harvest. Oats are not in good condition owing to the cold weather. Peaches, and indeed all other fruits, will be abundant this year in Michigan. Prices here are: Wheat, $1 00; oats, 29c.; corn, 40c.; butter, 13c.; eggs, 8c.; land from $50 to $100, according to improvements, quality and location.

N. Y., Clinton, May 18.—Thus far this week the mercury has stood at from 85 to 90 degrees in the shade at mid-day, and vegetation is suffering from lack of rain. The ground is so dry and hard that many farmers have been compelled to discontinue plowing sward land, and much of the planting will be delayed in consequence. Winter wheat is suffering, and grass is making but little progress in growth. A diminished dairy product is the result.

L. R.

ALABAMA, New Market, May 19.—Prospects for field and garden crops hereabouts were never better. Fruit is also abundant. I have experimented with many strawberries and find that Wilson's Albany suits my soil and this climate best. It is the most productive, and besides, requires little or no care.

IOWA, McGregor, May 19.—Weather fine here of late. Wheat looks well, though it needs rain badly. Corn planting is not all finished yet.

J. R. J.

MINNESOTA, Fairbault, May 14.—Our wheat has been benefited 25 per cent. by the rains we have had during the past week.

R. B.

The Querist.

ANSWERS TO CORRESPONDENTS.

Orchard-Grass.

C. H. H., Castile, N. Y., asks when and how to save the seed of orchard-grass and other information with regard to it.

ANS.—Orchard-grass cannot be compared with clover in any way. It is a grass that blossoms once in each year, just as timothy does, but two or three weeks earlier. It may be cut with the cradle and bound in sheaves or mown with the scythe and tied in bundles and thrashed with the flail or a thrashing machine, and cleaned by sifting from the straw. As the seed is very light it cannot easily be separated from the chaff. A bushel of the seed in the chaff weighs but 14 pounds. The season for cutting is in June, early or late, as may depend upon the season. When left for seed and ripened, orchard-grass makes rather poor hay, but when cut early, the hay is equal to any and is eagerly eaten by horses and cattle. When cut early and before ripening the seed, a second crop may be had, but not if left to mature seed.

About Corn.

R. F. M., Jackson, Mich., asks 1, how can he tell a sterile corn tassel from a fertile one; 2, how can he know when the seed is in a condition to be fertilized by the pollen; 3, will it answer to fertilize pollen year after year with seed from the same kind of plant; 4, is it advantageous to occasionally or always use seed brought from a distance.

ANS.—1. a sterile corn plant is one that has a tassel but bears no silk; the tassel is the male blossom and the silk is the female; a fertile plant is provided with both organs; otherwise, if growing alone, it could produce no fruit or seed. 2. The silk is ready to receive pollen from the tassel as soon as it protrudes from the husk. 3. Corn may be inbred with advantage and has been grown upon the same farm for 80 years without the introduction of any new seed and without any deterioration, but with conspicuous improvement. 4. In experimenting to improve corn, it is best to keep the seed pure from admixture with any other variety.

Castrating a Colt.

O. A. S., Macon, Mo., asks whether there is much risk in castrating his colt, as he has had no experience in such an operation, and there is no one else at hand to perform it.

ANS.—The operation may be safely performed by any person who has had successful experience with other animals. In making the operation, it is safest to use an instrument called an *ecraseur*, by which the separation of the cord, arteries and veins, is effected by torsion and not by cutting. This tends to prevent loss of blood and to encourage healthful healing. You must be your own judge of your capability for performing the operation, but we should think there is little risk if the wound is made to open to the bottom of the scrotum, so as to permit the pus that will form, to escape with ease, and if the weather is not too warm. It will be safer to prepare the colt by a cooling laxative, such as eight ounces of epsom salts a day or two previously.

"Puts," "Calls" and "Straddles."

A Subscriber, Newville, Ohio, asks whether a named firm in this city, who advertise that they do a peculiar sort of banking business, is trustworthy, and whether their method is founded on a sound basis.

ANS.—The whole system of "puts," "calls" and "straddles" done by the firm is sheer gambling, and anyone who ventures his money in such illegitimate transactions, takes the chances, of course. But the odds are so great against out-of-town operators, it is safe to say that in nine cases out of ten they are sure to lose their investments. We would strongly advise all our friends to stick to their legitimate business and let all such ventures severely alone.

Ventral Hernia in a Horse.

E. L. B., Lamb's Corners, N. Y., has a colt with a bunch, about the size of a duck's egg, on its belly and where it sticks out there is a hole the size of a couple of fingers, and he asks how to treat it.

ANS.—This is a case of ventral hernia or a rupture of the walls of the abdomen, through which the gut escapes. This may be replaced by pressure and working the bowel back through the opening, and it may be retained in its place by means of a pad and a bandage around the body. After the rupture has been existing for some time, the evil is more difficult to cure than when the injury is fresh. It would be best to consult some veterinary surgeon or other competent person as to the probability of cure.

A Weakly Colt.

S. B. P., Berlin, Pa., has a week-old colt which cannot rise without assistance, and he asks what ails it.

ANS.—The colt will probably become stronger as it grows older. In the mean time nothing can be done more than to assist it to rise when necessary. This is not unusual in the case of a colt whose dam has been overworked, previously to foaling.

Miscellaneous.

J. W. L., Smith's Grove, Ky., asks, 1, for a recipe for mixing paints and how to use varnish with them so as to produce a walnut finish on poplar furniture; 2, from what source does red clover draw its ammonia: 3, if an orchard is sown to some crop every year and grass is allowed to feed on the crop, would such treatment injure the trees; 4, is a large beetle called the "cow-bug" that deposits its young deep in the litter of stock, a mere scavenger or does it fertilize the soil.

ANS.—An excellent walnut stain may be made of asphalt varnish thinned down with turpentine. It should be tested on sample pieces before the work is begun, so as to procure the desired shade. After the stain has dried in, it may be rubbed with linseed oil and varnished precisely as walnut wood. 2. Clover is supposed to draw much of its ammonia from the atmosphere. 3. The best way to treat an orchard is to keep the ground fallow, plowing it twice each season. If too much wood is made, the land may be seeded to clover and the clover cut for hay for two or three years. You cannot grow two crops on the same ground at the same time successfully. 4. The larva of the beetle referred to, feeds upon the manure in in which the egg is deposited by the parent; it does nothing to fertilize the soil.

N. J. E., Birmingham, Ala., 1, asks how many grown "red-horse" fish can be shipped alive in a 40-gallon barrel of water over a distance of 65 miles; 2, what kind of screen should be used for the outlet of a fish pond to prevent the escape of young fish 3. Having planted his Blunt's corn in a row, the row flanked by potatoes, three feet away on one side, and by beets the same distance on the other, he asks whether he can compete for premiums.

ANS.—1. Probably 25 moderate-sized fish could be sent in a barrel of water. If air were pumped or blown into the water before the fish were started, it would refresh the fish considerably. 2. A screen for a fish pond, to restrain young fry, should be of galvanized wire net of one-eighth of an inch mesh. 3. For reasons, the corn *must* be planted *within* a plot equal to or *less* than 33 feet square.

B. L. B., Buckville, S. C., asks who is considered the maker of the best pianos and organs; and how do those made by D. F. Beatty compare with others.

ANS.—It would be difficult, if not impossible to answer this question. Many of the pianos and organs now on the market are excellent, and a choice is as much a matter of fancy as of judgment. Of two instruments equally good, it would puzzle the buyer to explain in what particular his selection was the best. Invite the kind offices of an agent to aid you in your selection, and you will perhaps understand what we mean. The Beatty piano and organ are sold at a very low figure; hence their popularity. We do not think them as good as some others that sell at a higher figure.

L. W. S., Chenango Co., N. Y., asks whether Mollie Faucher, of Brooklyn, is still alive, and whether the almost incredible stories told about her, are true.

ANS.—The young woman is still alive, and as healthy as she has been for some years, during which, according to her own account and that of her friends, she has eaten or drank little or nothing. It is claimed by some that under certain conditions she is gifted with clairvoyance; while others scout both her marvelous abstenence from food, and her spiritualistic pretentions. Several medical experts are at loggerheads about her condition, and we do not wish to anticipate their final verdict with regard to the matter, by straightway definitely deciding the question.

C. C. A., Providence, Pa., who says he had already obtained three crops of sprouts from our potato premium, and would have another in a few days, asks, 1, whether coal ashes are good to mix with barnyard manure intended for potatoes, before hauling it out; 2, where can he get some darts for the parlor air-pistol furnished by us as a premium to agents.

ANS.—1. The coal ashes would have no appreciable effect. Coal ashes may change the mechanical condition of the soil—that is all so far as we know. The good effect often attributed to coal ashes may sometimes be due to the *wood* ashes intermixed therewith. 2. From the Pope Mfg. Co., Boston, Mass.

F. D. P., Rome, N. Y., says that for two years his Delaware and Sweetwater grape vines have been stricken with blight, so that the leaves fell and the grapes wouldn't ripen. Dusting with sulphur has had no good effect, and he asks for a preventive.

ANS.—If the injury is caused by mildew, we know of no better remedy than sulphur. Should the vines be similarly affected this season, please send us a leaf and a section of vine.

J. M., Fredonia, N. Y., asks our opinion with regard to the Eureka Mowing Machine.

ANS.—The "Eureka" Mower is a very efficient machine, of which we have had very satisfactory reports from those who have used it. The Company has passed through several crises, but is now organized on a very substantial basis, and the "Eureka" will probably soon be in very general use.

W. H. T., Elmdale, Kansas, and several others, ask whether they can procure back numbers of the RURAL.

ANS.—We are in the habit of printing a considerable number of extra copies every week; but during the past season so heavy have been the orders for back numbers by new subscribers that our store of many issues is entirely exhausted.

H. K., Copper Hill, N. J., asks whether the barb wire fence advertised in the RURAL is a good article, and whether it would be likely to injure stock.

ANS.—The barbed wire fence advertised by the Washburn & Moen Mfg. Co., is a very serviceable, durable fencing, and highly esteemed wherever used. There is no danger of its injuring stock.

G. H., Seneca, Nehama Co., Kan., asks where can he obtain a good root-cutter.

ANS.—Higganum Mfg. Co., Higganum, Conn.; Belcher & Taylor Agl. Co., Chicopee Falls, Mass., and R. H. Allen & Co., New York. Either has excellent root-cutters.

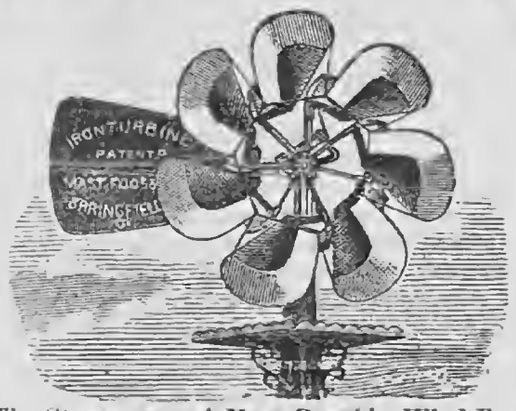
Mill Manufactory
Established 1851.
Grist Mills
OF
FRENCH BUHR STONE
Portable Mills for Farmers, Saw Mill Owners, etc. Price from $80 up. Complete Mill and Sheller $96. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mill very cheap.
NORDYKE & MARMON CO.
Indianapolis, Ind.

Implements and Machinery

Halladay Standard.

VICTORIOUS AT
Phila., 1876—Paris, 1878,
25 Years in Use.
GUARANTEED SUPERIOR
To any other Windmill Made.
17 SIZES—1 MAN TO 45 HORSE POW.
Adopted by the leading R. R. Co.'s and by the U. S. Govt. at Forts and Garrisons.
$3,500,000 worth now in Use.
Send for Catalogue "B" and Price List.
U. S. WIND ENG. & PUMP CO.,
Batavia, Ill.

NEW IRON TURBINE
WIND ENGINE



The Strongest and Most Durable Wind Engine in the World. Sold by Dealers in nearly every County. Inquire for it. Every Wind Engine Fully Warranted.
Send for Circulars, Price-List and information to
MAST, FOOS & CO.,
Springfield, Ohio.

Eclipse Victorious
at Paris Exposition.
Awarded 1st Prize Medal over all others.
We build 17 sizes Wind Mills for Farm Pumps and Power Purposes.
The strongest Wind Mill in the world.
Send for Catalogue No. 4.

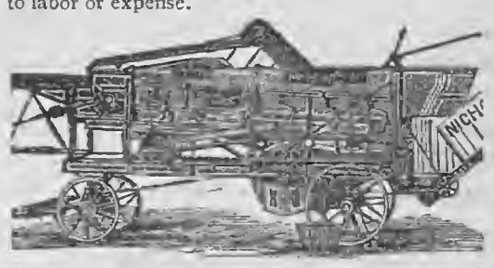
THE EXCELSIOR **$3 Printing Press**
Prints cards labels &c. (Self-inker $5) 13 larger sizes For business or pleasure, young or old. Do your own advertising and printing. Catalogue of presses, type, cards, &c., for 2 stamps. Kelsey & Co. Meriden, Conn

Implements and Machinery.

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

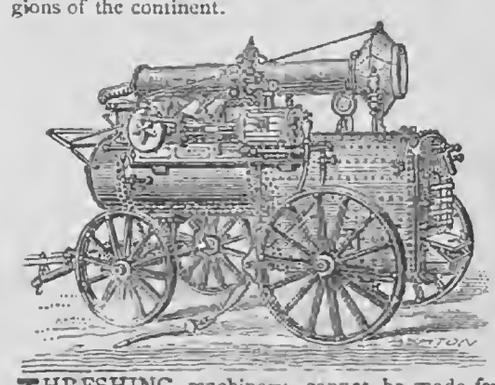
OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.



IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness**, not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence,** whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich

NEW EXCELSIOR LAWN MOWER.

Reduction in Price!
LESS WEIGHT! LIGHTER DRAFT!
It has been adopted and can be seen in PRACTICAL OPERATION in the PUBLIC PARKS of NEW YORK, BROOKLYN, BOSTON, NEW HAVEN, CLEVELAND, CHICAGO, and almost all the Prominent City Parks in the United States and Canadas.
Roller Mowers, 7 Sizes; Side-Wheel Mowers, 6 Sizes; Back-Wheel Mowers, 5 Sizes; Horse Mowers, 4 Sizes.
10-Inch Popular Croquet Mower, $10
Our New Horse Mower is conceded to be the **Lightest** and **Best** Horse Lawn Mower ever made

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MAY 31, 1879.

TO EVERY READER.

We respectfully and urgently call the attention of our readers to the *necessity* which exists that they should address their communications to the Editors or the Publishers of the Rural New-Yorker, if they would insure prompt responses. Letters addressed to individuals are often delayed in this office for weeks. Mr. Moore, to whom letters intended for us are still occasionally addressed, has had no connection with this journal for years.

DRINKING AT MEALS.

We were once told by a shrewd old college professor that the most foolish thing a man of intelligence can do—from the worldly point of view—is to "butt his brains out against a popular prejudice." Still we are sometimes dreadfully tempted to pound our cranium against a hurtful notion, and have never been more so than while reading the advice so often insisted on in the papers against drinking water at meal-times. The chief and most plausible argument against this practice is that it dilutes the gastric juices, and so delays digestion. It is not often in a scientific discussion that we can so easily as in this case appeal to the individual consciousness of the uninstructed reader in proof of the fallacious character of the assumption in question. Who that reads this has not had a thousand proofs forced upon his attention that water taken into the stomach remains there but a few seconds, is quickly taken up by the blood vessels, and, if in excess, almost as quickly thrown out of the blood again through the kidneys? Yet there is a small grain of truth in the midst of this gross error. Large draughts of very cold water taken into the stomach with the food, by chilling the stomach during its rapid progress through the walls of its vessels, do arrest the secretion of the digestive fluids until the proper warmth is re-established. Large draughts, also, of tea and coffee, by the astringency of the former and by the nervine action of the theine they both contain—as well, also, as by the peculiar narcotic action of coffee—derange and hinder digestion. Alcoholics, however diluted, have a like effect.

With these limitations, we but declare the consensus of all physiologists when we say that a full response to the calls of thirst, at meal-times as at other times, is wise and proper. And for these reasons: The sense of thirst is given to us not only that we may keep the fluids of the body duly supplied with solvent and diluent material, but also that, through the excretory organs, all soluble offensive substances may be quickly washed away. In the digestive process the demand for water in aid of both these necessary purposes is urgent. In nearly everything we eat there are soluble substances that are in excess, and this excess should be promptly carried out of the system. Perhaps the most abundant among these, usually, is the common salt so freely taken. It is, however, by no means the only one; and they all, unless promptly removed, act as irritants. Their action upon the stomach will in a very short time decrease and soon arrest the flow of the gastric fluids and disturb the muscular action by which the stomach "churns," so to speak, its contents, that every portion may receive its due admixture of digestive material. This disturbance of muscular action is seen at its highest in vomiting, by which the offending substance is ejected summarily, together with all the contents of the organ.

Now, it is best not to over-eat, and it is best to eat simple food, with as little excess of seasoning or of objectionable elements, as possible. But, under all circumstances, it is both wrong and dangerous to give refusal to nature's call for nature's remedy in such cases. Plenty of drink is what is demanded, and a free supply of fluids must be given, if serious consequences are to be avoided.

The consequences of refusal are not all immediate. The irritation from lack of drink, as well as that from improper drinks, becomes in time chronic, passing to inflammation, the result of which is dyspepsia and the symptom of which is pain. Then, for want of diluent fluid by which offending soluble substances are quickly removed, these often assume insoluble forms, and are deposited in various parts of the body, to remain there, constant sources of pain and danger. Gravel and stone in the urinary organs, biliary concretions in the liver, calcareous deposits in the joints and elsewhere, and possibly tubercular deposits in various organs, are, we may say with much certainty, due in some degree, to a foolish fear of water-drinking.

OVER-PRODUCTION.

It is to be regretted that any economists should intimate the belief that there is, or threatens to be, over-production of the fruits of the farm. Already our agricultural interests have too much and too many kinds of opposition. The prevailing low prices of the articles raised by the farmer are not to be accounted for on this ground. Neither is the widespread financial trouble to be attributed to such a cause.

It is readily admitted that local or general markets may easily be over-stocked with various kinds of manufactures, and also with those articles of consumption that are regarded as luxuries; but these bear to the community an entirely different relation from that sustained by the usual products of agriculture. All kinds of articles of commerce have shown a corresponding decline in price. If farmers need much that they cannot buy, the same is true of those engaged in all other occupations. The low prices of farm products are not attributable to the absence of a demand for them, but rather to the want of the money with which to purchase them.

All over this vast land there are now, and probably always will be, districts which need far more meat and grain than they have or can obtain. Taking a broader view, the worn and denuded lands of the Old World are scourged with terrible famines from time to time. China, in a few years, has lost millions of her people from this cause. Syria and India have been—and the latter even now threatens to be again—the scenes of horrible mortality and desolation from the same calamity. Brazil and Morocco have also been greviously affected by famine during the past year.

For the following reasons we believe that no section need to fear over-production of the necessaries of life: The means of transportation are so rapidly multiplying that there are always near or distant communities that may be reached, that are in immediate and urgent need of what the farmer raises. These means of transportation are constantly increasing. The growth of population and the vast extension and multiplication of non-productive callings will prevent any diminution of the demand for the direct and indispensable means of subsistence.

The nature of the products of the soil is such that in many instances they can be converted into other forms that may prove more marketable. If there be more corn than is needed, there may be a scarcity of good beef, butter, mutton, pork, etc., and these can readily be raised from the corn. Again, there is such wonderful adaptation in our soil and climate, that, at least in many parts of our country, there is a vast privilege of choice as to what articles shall be produced. This ought to protect the intelligent farmer from the disappointment of an overstocked market.

Millions of our people do not have a pound of fresh fruit of any kind for a great part of the year. Millions do not have a pound of butter for months. Millions scarcely know the taste of good, rich milk. Millions are living almost entirely without meat. Millions are to-day without a single article produced in the garden. Millions do not taste mutton once a year. Millions have to live nearly or quite without wheaten flour. Millions have not enough corn-bread. Does that look like over-production?

CAREFUL PACKING ALWAYS PAYS.

Coming up Fulton street a few days ago, we noticed, in front of a fruit dealer's store, several boxes of oranges, some of which were put up in the ordinary style, while in others the oranges were wrapped variously, some in red, some in blue, and others in the ordinary white papers, and packed in the order that gave the most pleasing appearance. Being attracted by the novelty, we inquired of the proprietor if the fruit so packed was of a superior quality. "No," was the reply, "it is all alike; but," he added, "that style of packing makes it sell quicker."

Here, we thought, is a lesson for the readers of the Rural, and one by which they can profit. We have previously often called attention to the fact that time spent in properly preparing for market all articles that are offered for sale, whether they are productions of the factory or the farm, is time well spent. Taking fruit for an example, one having a hundred barrels of apples will send all in one lot. The smaller ones give an undertone to all the others. If four or five barrels of the smaller and imperfect ones were selected and kept at home, the balance of the lot would sell for more money than all together would bring, and if those sent were divided into two lots—extra and fair—they would probably sell for still more than if sold in one lot.

Two or three cents a pound more can be readily obtained for butter of the same quality when care is taken to pack it nicely. Appearances may be deceitful in many cases, but they go a great way in fixing the market price of any commodity. Perhaps there is as much difference in price made by "looks" in poultry as in any article sent to market. A walk through Washington Market any day in the week, would prove to the satisfaction of any ordinary observer that the profit or loss of poultry-raising depends not so much on the management of the fowls before as after they are killed.

A case in point occurs to us. We visited, a while ago, a friend in the Connecticut River Valley, whom we will call A. His farm adjoined that of B. A was known as one of the neatest farmers in the neighborhood; B was the reverse. Both raised tobacco. A had sold his for a good price; B could get no offer for his. One day he came to A and said, "My tobacco grew as well as yours; was as well ripened and cured, but it doesn't sell. What is the matter?" "Because it doesn't look well," was the reply. "When stripped, you put it in hanks carelessly and with no regard for appearance. If you will overhaul it and do it up nicely, you can easily find a customer." The advice was followed, and in a few days the crop was satisfactorily sold to a dealer who had previously seen it and declined to purchase.

Everybody knows that neatness and order are everywhere attractive, and should readily infer that they pay well in the end.

THE CROPS.

The latest information from different parts of the country gives assurance of heavy crops everywhere. The recent abundant and widespread rains have removed the alarm of farmers, especially in the West and Northwest, with regard to the injury likely to be caused by a prolonged drought. From all sides confidence is now expressed of an unusually fine harvest. The accounts from Ohio, Indiana, Illinois, Minnesota, Dakota, Iowa, Kansas and Nebraska indicate a large increase in the production of cereals. Throughout the great wheat region the acreage under wheat is considerably larger than last year, owing to the new land taken up and cultivated, and because the dryness of the early part of the season enabled farmers to plow land not tillable in a wet spring. Spring wheat, as a rule, looks well, but the production of this sort is yearly diminishing. The corn crop will be larger this year than ever before, according to present estimates. Here and there fruit has been somewhat injured by late frosts, but on the whole a heavy yield is confidently expected. The reports with regard to barley and oats promise heavy crops. The welcome rains have given the grass a fine start, and the fears entertained early in the season of a short hay crop are now replaced by high hopes of an unusually abundant one. Out West the cultivated or tame grasses are being extensively introduced with very satisfactory results. The outlook for agriculture this year is, on the whole, highly encouraging.

BREVITIES.

How beautiful the world is now!

Cherries are now in the New York market.

The Plymouth Rocks make the best of mothers.

Keep the growing canes of Grape-vines well tied to their stakes or trellises."

Dendrobium nobile is one of the best Orchids and one of the easiest to cultivate.

Those who wish to have a fine display of Zonal Pelargoniums for next fall, should strike cuttings now.

The cunningest little chicks in the world when first hatched out, are the White-crested Polish.

In our wheat fields, or in those of our neighbors, there is no appearance of injury by the Hessian Fly.

Pinch off blackberry and raspberry shoots, the laterals when two feet long, the leaders when three or four feet high.

Young grape-vines that have pushed many buds, should now have all rubbed off but one or at most two of the strongest shoots.

Phlox reptans is now one of our showiest, hardy herbaceous plants. The flowers are of a reddish-purple borne, in corymbs. The plant will grow anywhere.

"Alas!" says Mr. Crozier, "beauty now-a-days counts high—far too high—in the selection of a cow, no matter how much or how little milk she may give." 'Tis true.

Rural Farm Note.—Weather showery and warm. Cherries and Peaches have set well, and there seems scarcely any further danger to be apprehended from frost.

We are pleased to see that some of our contemporaries are cordially supporting our advocacy of children's gardens. Meantime the Rural's Horticultural Club of Youngsters is growing thriftily.

As we state in another column, 70 weevil-eaten peas were planted at the Rural Grounds two weeks ago. One only germinated—a sickly plant. How fond many of us are of stating mere impressions as facts!

"Professor" Henderson of the Rural Farm requests us to state that he finds lamp-black, applied with a woolen cloth, the very best substance for burnishing the brass or silver-plated mountings of harness.

We have had occasion to notice that plants which have been wintered in cellars, pots or greenhouses are often planted too deeply in the open ground. This is often a fatal mistake with such tender plants, the same as it is with fruit trees.

Those who received the lettuce we sent to them in the Free Seed Distribution, are asked to cut it off to the ground as often as the leaves are large enough for table use. The quantity that a small bed will thus supply may surprise those who do so.

X. A. Willard says: "Putrid water is often the only kind by which the cow can slake her thirst, and yet it is productive of disease. We have a law to prevent watering milk, and yet a farmer is not prohibited from permitting his cows to quench their thirst in the most filthy and poisonous water."

Make a Note of This.—Plant, next fall or spring, in one group, the following: The Golden-leaved Spirea, the Purple-leaved Hazel-nut (Corylus Avellana purpurea), the Golden Elder (Sambucus nigra aurea). In another group, plant the variegated Rose of Sharon (Hibiscus Syriacus), the variegated Dogwood (Cornus Mas.), and the variegated Coral Berry (Symphoricarpus vulgaris).

The imported cabbage-worm, Pieris rapæ is rapidly progressing westward. It was observed at Quebec in 1859. Thence it passed southward along the Atlantic coast, and having once gained a good foothold, it commenced its westward march. It seems to take longer strides with each year. It has now reached Iowa and is rapidly advancing into Missouri. The butterfly is white with one or two clearly defined black spots on each fore-wing. Hot water, or one pound of whale-oil soap dissolved in six gallons of water, thrown upon the plants will kill the larvæ.

With Beets we have been most successful in those of our fields the soil of which we have described as a sandy-muck. For field culture, the rows should be three feet apart and the plants thinned out in the row to ten inches at least. For garden culture, the rows need not be over two feet apart. There is now a tendency to plant all crops further apart than in bygone days, and the tendency is no doubt good. In our desire for large yields, overlooking the importance of air and sunlight, as well as the extent of ground which the roots should be permitted to traverse freely, we are too prone to estimate the yield of the crop by the *number* of plants cultivated. The proper cultivation of beets has especially been ignored in this country.

Our plants of Prickly Comfrey, which we cut three times last summer, are growing vigorously now and are truly objects of some general beauty and of great symmetry. They are nearly five feet tall, compact, conical, prickly—very prickly. Prickliness and symmetry, however, do not add much to the value of the plant as fodder. A gentleman wrote us a little while ago that his advertisement of Prickly Comfrey in the Rural did not pay him very well, while the reverse was the case in other agricultural journals which do not claim so large a circulation. Had our friend been interested in the Rural otherwise than as an advertising medium, he would probably never have sent us the advertisement at all. We have several times stated that we could find no animals that cared for it, and this, one would suppose, was enough to have condemned it in the estimation of such of our readers as have not tried it for themselves.

Mr. Barron, of England, instituted a few years ago some experiments to gain, if possible, more light upon the influence which the stock exerts upon the cion and *vice versa*. A certain number of stocks of each kind were allowed to grow without let or hindrance, and the others were grafted with the Blenheim Orange, it being desirable to know what effect the different stocks would have on the same variety of Apple. At the present time, according to the London Chronicle, the results of the experiment are very clearly apparent, the young trees on the French Paradise and Doucin stocks being full of bloom, while there is none on those worked on the Crab, and but very little on those grafted on the English Paradise. It is also worthy of record that the same results were experienced last year. So much for the influence of the stock on the cion. Another singular fact which these experiments have brought out bears upon the opposite question—the influence of the cion upon the stock, and it is this, that during the winter of 1877-8 several of the unworked French Paradise stocks died; and during the past winter the remainder followed suit; thus proving (1) that in a state of Nature the French Paradise is a short-lived tree; yet (2) when grafted with another variety it lives for years—in fact, for an indefinite period.

Literary Miscellany.

LINES.—TO THE FIRST FLY OF 1879.

DANCE on my nose with your tickling feet,
Blue-bottle fly!
Sing in my ears with your buzz to greet
Me, as I lie.
You will seek me out in my dark retreat,
With an eager zeal that no screen can beat,
And I try to slap you clear into the sweet,
Sweet bye and bye.

I haven't seen you since seventy-eight,
Little house fly;
And I see you now with the bitterest hate
You can defy.
Oh, how I hate you, nobody knows,
Author of half of my summer woes;
Oh, how I prayed that you might be froze,
Villainous fly!

All through the winter you did not freeze,
Not much, Mary Ann.
Now all the summer you'll do as you please.
That is your plan.
When in the warm afternoons we would sleep,
Near us your wakefulest vigils you'll keep,
Precious is sleeping, but waking is cheap.
Sleep, man, if you can.

Oh, how I wish that my two broad hands,
Spread left and right,
Stretched from the poles to Equator's bands,
Giants of might:
Some summer day in my wrath I would rise,
Sweeping all space with my hands of size,
And mash all the uncounted millions of flies
Clear out of sight.

Vain are my wishes, Oh, little house fly!
You're hard to mash;
Strong men may swear and women may cry,
*Teething their gnash;
But into the house your friends you'll lug:
You'll bathe your feet in the sirup jug,
And your cares you'll drown in the baby's mug,
Cheeky and brash.

Still, precious lessons, dear little house fly,
You teach to me.
Hated or loved, you tell me that I
Happy may be.
Why should I care, when I tickle a nose,
Whether its owner's conduct shows
That he likes it or hates it, just so it goes
Pleasant to me.—[*Hawkeye.*

* This should read "Gnashing their teeth," but a little poetic license was necessary to bring it in the rhyme.

AN UGLY GIRL.

(Continued from page 334.)

CHAPTER XIX.

COULD IT BE TRUE?

THE abruptness of Mr. Dunforth's inquiry was not so startling to Noel as the words in which it was couched. At one and the same time he was surprised, displeased, and penetrated with a sharp pang of suspicion.

Who and what was Hillian Gray? The answer to that seemed simple enough. She was an orphan, who through her relationship to Mrs. Hurst, the heiress's duenna, had obtained the post of companion to Miss Carlsforde; and, in her conversations with Noel, she had referred once or twice to the quiet life spent at the country house in which the late lord had immured the daughter, whose ugliness he could not endure. She had also spoken of the sorrowful weeks that followed their hasty summons to the Park; but it was also true that she had never lifted the veil from her earlier years. She was an orphan, and Mrs. Hurst was the only relative she possessed: this was all that Noel knew concerning her. Yet another had recognized her and boasted that the present was not their first *rencontre*. Why did it pain him so much to be told this? Why did he feel that it would have annoyed him less to hear her name on any other lips than those of Clement Dunforth?

Where could they have met. Clement was a Londoner, who rarely quitted the metropolis. Hillian Gray—as long, at all events, as she had held her present situation—had dwelt in the greatest seclusion. There was something so perplexing in the affair, that Noel could not resist putting in a few questions in his turn.

"I suppose my sister has told you what position Miss Gray occupies here? Are you sure that you have seen her before?"

"Quite sure; hers is one of those faces not easily forgotten," was the emphatic reply.

"But where have you met?"

"In town," said Clement, curtly.

"Impossible! Miss Carlsforde resided till lately in a village in Devonshire, and Hillian Gray was her constant companion."

"Possibly. But it is two years since I saw the young lady. You seem to be so completely in her confidence, that I wonder she has not spoken to you of a certain time when she most decidedly was *not* residing at the obscure village you mention."

Noel felt embarrassed by the disagreeable significance with which this was said, but his annoyance made him answer with promptitude that he was not in Miss Gray's confidence at all, and therefore he saw nothing surprising in her silence concerning her own affairs.

"If you are so well acquainted with her as you profess to be," he added, "why did you question me?"

Clement smiled, and seemed quite amused by the irritable tone Noel was taking.

"You are laboring under a mistake. I have not boasted of any acquaintance with Miss Gray; I merely told you that I recognized the young lady again, and seeing her here—the last place where I should have dreamed of encountering her—made me naturally feel curious to learn by what name she is known to you."

By what name! Those words seemed to imply that Hillian had stooped to a deception, and it was with darkening brow that Lord Carlsforde commented upon them.

"That was rather an equivocal speech, Mr. Dunforth, and as Miss Gray holds the post of companion to my kinswoman, I think I am justified in asking you to explain it."

"I know nothing to Miss Gray's discredit," answered Clement, quickly, "except——"

And then he made so long a pause that Noel's impatience became intolerable.

"For Heaven's sake continue. But no! I will hear no more! I could stake my life that Hillian Gray is as good and pure as she appears. Why should I pry into any sorrow or trouble she wishes to keep concealed?"

"I beg your pardon; I thought your anxiety to hear the little I had to tell was prompted by no personal feelings, but consideration for Miss Carlsforde."

Noel felt the blood rush into his face, for Clement Dunforth spoke with a sneer and a significant glance that was not pleasant.

"Both feelings have weight with me," he frankly replied. "I lie under great obligations to Miss Gray, and remembering this, I repeat that I would rather hear no more; unless you, as an honorable man, feel that there is aught which I, as Miss Carlsforde's friend and kinsman, ought to know."

Clement shrugged his shoulders.

"How am I to answer this? It was only on two occasions that I saw Miss Gray, till I arrived here yesterday; once in a lawyer's office, where I might not have noticed her—for I was only there to deliver a message—if she had not been weeping excessively, and begging some boon with clasped hands from the head of the firm; the other time—don't be shocked—was near St. Giles's, and Miss Smith, as she then called herself, was in the hands of the police."

"Great Heavens! on what pretext?"

"I really can't say. I heard something about a stolen chain—a gold one, with a diamond cross appended; but such cases are so common in the streets of London, and a crowd so soon collects, that I did not stay to hear more. Of course the little girl may have been innocent; but you cannot feel surprised, after this, that I was considerably startled on finding her here, and under another name."

He went away when he had whispered the last few words, leaving Noel alternately hot and cold with dismay. Hillian, the gentle, right-minded Hillian, whom he had been inclined to regard as a pattern of women, a *thief!* Incredible! It was—it must be a case of mistaken identity. He would himself tell her of the young lawyer's foolish mistake, and they would have a hearty laugh over it together.

He was eager for an opportunity of doing this; but Jephson stubbornly refused to let him have any more visitors, alleging, with truth, that the long conference with Mr. Dunforth had left him with all those feverish and restless symptoms Dr. Monson was endeavoring to allay. Baffled by his attendant's firmness, and his own helpless condition, Noel feigned to submit, and presently contrived to obtain one concession. Jephson consented to set his door ostensibly ajar, that the room might be cooler; he did not guess that his charge's actual reason for asking this was that he might be able to hear the light foot of Hillian pass by, when she came up stairs to make a few changes in her simple toilet, before the bell rang for dinner.

Fortune favored his wishes. Jephson, deceived by his silence and closed eyes into the belief that he was sleeping, went off guard for ten minutes to enjoy a whiff of tobacco in his pantry, and had scarcely disappeared when the step for which Noel listened drew near.

He raised himself on his elbow, and his beseeching "Miss Gray pray come here!" was answered by her appearance at the door.

"Don't ask me to come further," she said, with a pensive smile, as she flung him a lovely little bunch of autumn flowers. "If you had heard Jephson's tirade on the mischief our thoughtless chattering has done your lordship, you would not wonder that we tremble to approach you again."

"Jephson is an old idiot, and makes me worse by penning me up here," was the vehement reply. "My own thoughts only harass and excite me, into forgetfulness of them."

"If you think so—if I might read aloud——"

"No—no, I want to converse with you. Remember that you are the only person in the house with whom I can hold any rational conversation."

"True; that accounts for what you said just now." Hillian replied, the glow fading from her cheek; "but Dr. Monson forbids——"

He would not let her finish.

"Dr. Monson does not know how terrible it is to lie here brooding over circumstances which worry me by my inability to find an explanation for them; unless, indeed, you—yes, you—consent to help me."

Hillian gazed at him uneasily, as if his agitated manner and strange expression inclined her to fancy that he was light-headed, and she came and stood at the foot of the bed.

"My dear Lord Carlsforde," she said, soothingly "you are to blame to worry yourself in this way respecting your sister's future. Mr. Dunforth cannot refuse to wait for your decision till you are quite recovered; until then, pray try to dismiss the subject from your mind. May I give Irene a hint that your are really not well enough to discuss it yet awhile?"

Then she imagined that it was of Irene he was thinking. He did not stay to undeceive her; for Jephson might return at any moment, and it would be terribly exasperating to let her leave him with his doubts unsolved.

"You have not told me what you think of Mr. Dunforth? By-the-way, this is not the first time you and he have met?"

Hillian opened her eyes widely.

"What makes you say this? Mr. Dunforth is a stranger to me—quite a stranger."

"You are sure of it?" demanded Noel. "And yet he spoke of recognizing you."

Hillian recoiled, and grew rosy red; then her face as suddenly blanched, and her voice was tremulous, as she faltered:

"No, no—impossible! You would not speak in this way, if you knew; but what did he say concerning me?"

"Could he tell me anything which you would not like me to hear?" asked Noel, in tones as uncertain, as troubled as her own.

The silence that followed made his heart sink. Was Dunforth right? and were there mysteries in this girl's life that savored of degradation and shame? He lay back on his pillows, breathing heavily, and afraid to ask more.

"Will you kindly answer my question, Lord Carlsforde?" she said, presently; and then Noel remembered that he had no right to catechise her—that it was dishonorable to attempt to make her criminate herself. Whatever she might have done, to him she had been so kind, so attentive, that the line of conduct Clement Dunforth's revelations had tempted him to pursue was inexcusable.

"I beg your pardon, Miss Gray; I am selfishly forgetting that I—I am detaining you. Did you ask what Mr. Dunforth told me? It was this: he said that he believed he had seen you twice in London about two years since."

Hillian's perturbed face was almost sufficient reply.

"I can neither recall his features nor his name," she said, in tones so low, that her auditor could barely distinguish them.

"Probably not; as he says they were chance meetings. Shall I tell you where he saw you?"

But Hillian extended her hands with an imploring cry.

"No, no; let me forget the miserable weakness—the folly which I have never ceased to repent? I hoped that no one—no one whose respect I prize—would ever know, ever hear——"

She broke down in sobs, and fled the room.

CHAPTER XX.

WITH IRENE.

WHEN Jephson came back, he found Lord Carlsforde lying in much the same position as he had left him, and did not notice that his face was pressed into the pillow, or his hands tightly clenched, and his whole frame frequently convulsed with emotion. How could he, ignorant of what had happened during his absence, guess that Noel—when, from Hillian's half-made confession, he learned of her unworthiness—discovered at one and the same moment that she was so very dear to him, that it was agony to be forced to despise her? She was so sweet, so gentle, she so completely realized in all but beauty his ideal of woman, that insensibly she had stolen into his affections; and every moment of her absence had been employed in recalling what she had said, or how she had looked, and counting the hours that must elapse before he would again behold her—in fact, he could not hide from himself that he loved her, but with so quiet, so equable an affection, that he had not guessed its existence till the miserable hour in which he learned that Hillian was not what she seemed.

Then he became furiously angry with himself for having yielded to such weakness. What excuse had he—penniless, and encumbered with Mrs. Estcourt and her children—to waste his time in a romantic fancy for a young girl whom he had never seen till he came to Carlsforde? Did he not deserve all the vexation and disappointment it was entailing upon him?

"Let me be thankful," he told himself, with quivering lips, "heartily thankful that Hillian Gray is not all my imagination painted her. Now that I am disenchanted, I shall soon contrive to forget that she was very dear to me. But, if I had remained in ignorance of the truth, what might not have ensued? At some unguarded moment I should have confessed my love—I, who must not, dare not, think of marrying till my father's second wife and her little ones are provided for. It would have been madness to try to win the heart of a young creature to whom I had nothing but a title to offer!"

But presently Noel, growing more composed, came under the dominion of softer feelings. Perhaps he was judging Hillian Gray too harshly. She had been powerfully affected by the allusion to those events of which the particulars were known only to herself; but, in her incoherent exclamations, the word "Guilt" had certainly had no part. She had declaimed against her own conduct, and expressed her grief that it should have become known; but was it at all likely that a girl, who in the daily intercourse of the last few weeks had invariably proved both right-minded and refined, would allude to a crime, a positive crime, as a mere folly?

"I will wait till I know more," he decided. "It would be a base return for her ministrations, if I were the first to look coldly upon her for some deed committed in the past, and bitterly repented. Clement Dunforth may have done me a good turn in opening my eyes to the truth, but he shall not lower her in my estimation or that of others. His tongue shall not run as glibly to strangers as it did to me."

But, as he resolved to sternly give Irene's lover warning of this, his brows contracted, for could he not divine how it would be received? Would not the astute, self-possessed lawyer demand to know in what way he had satisfied his conscience that it was right to permit a person like Hillian to continue to hold a position of trust in Miss Carlsforde's household? And how could he answer?

"Hillian herself must tell me all, and enable me to defend her," he exclaimed; and, although the next moment found him doggedly declaring that it was no business of his, he soon returned to his former determination.

He would seek to win her confidence, or wait patiently till she volunteered an explanation; and this he was the more inclined to think she would do, because he felt sure she must have detected in his looks and words how much it had cost him to hear a slur cast upon her.

By dint of a great deal of coaxing, Irene on the morrow procured permission from Dr. Monson to visit her brother; the grave, but kindly Doctor, who was half ashamed of yielding against his better judgment, first extorting a promise that she would not touch upon any exciting topics.

Irene thought she was strictly keeping her pledge when the first question she put to Noel was, what did he think of his determined opposition to to the match? a piece of ill-nature for which, by-the-bye, she had scarcely forgiven him.

"You foolish child! Was I suffered to have a voice in the affair? Was it not arranged before I had an idea that it was in contemplation?"

"Oh! don't go over that old grievance again," she entreated. "Have it out with ma, and let you and I stick to the pleasanter things."

"Does Mr. Dunforth approve of your talking in this inelegant style?" her brother demanded.

"Why, that's worse and worse!" objected Irene. "Please to leave my errors of language alone, and answer what I asked. What do you think of Clement?"

"He appears to be a very shrewd, prudent young man, and——"

But Noel was stopped before he could say more.

"Oh! don't call him that! Shrewd men are always prying and snappish, and sensible young men part their hair the wrong side, wear shabby coats, sew on their own buttons, and develop into fussy old bachelors! I hate prudent people! and sensible ones are my abhorence! If you cannot give Clement better praise than that, why, don't praise him at all."

"Then I will be silent till I know him more intimately," answered Noel. "But I suppose I may tell you that I was very glad to find him so reasonable on the subject of your marriage."

"Oh, yes; he is reasonable enough," was the careless reply. "He says that if you cannot settle anything on me we must contrive to do without it. Mrs. Hurst is delighted with him."

"And Miss Gray—is she equally pleased with him?" Noel was tempted to inquire.

Irene's rosy face clouded.

"Miss Gray can be very disagreeable when she chooses. Ay! you may look; but I do call it downright disagreeable of her to tell me that she was not impressed in Mr. Dunforth's favor. She knew I had set my heart upon her liking him."

"Would you have had Miss Gray deceive you?"

"Need she have gone and prejudiced herself against the very person I was so anxious for her to admire?" retorted Irene, with a pout. "You see, Noel, she knows almost everything—in the way of housekeeping, I mean—and as I am determined never to consult ma, as it would give her an excuse for coming and interfering, which she never, never shall, I thought it would be so nice to ask Miss Gray to come and stop with me till I can manage for myself; and how can I, if she refuses to be friendly with him?"

"I suppose Miss Gray is polite to Mr. Dunforth," Noel observed.

"Was it polite to treat him so distantly that he bit his lips and whispered something which I daresay it was as well I didn't hear? It's all the more annoying, because I feel myself compelled to resent her treatment to Clement, and yet I hate sulking. Why can't people like each other when I wish them to?"

"I'm afraid Mr. Dunforth must have given Miss Gray some cause for treating him with a coldness so much at variance with her usual manner," said Noel sharply. "If he thinks that what has happened gives him license to behave to her with impertinence, I shall soon teach him his mistake."

"What nonsense are you talking now?" cried the vexed Irene. "Every one seems at cross-purposes. I will fetch Clement, for he can defend himself against your unjust remarks better than I can. I'm sure he did his utmost to conciliate Miss Gray, as well as her aunt. Is he to be blamed because she would sit aloof and say nothing?"

Noel mused.

Did Hillian fear the revelations it was in Clement Dunforth's power to make, that she was so anxious to avoid him?

The baffled thinker felt that there was but one course open to him, and that was to let the matter rest.

He apologized for his pettishness to his sister, who was easily induced to forgive it, and soon rattled on as before.

"She was going to write to ma that day and ask her to let the dressmakers commence her *trousseau*. Where was the money to come from? Oh, it must be managed somehow, for whoever heard of a girl being married without one. The wedding-robes must wait till she had made up her mind which would be the most becoming."

"But my dear Irene, there is time enough for thinking of these things——"

"Time enough, when Matilda Jenkins's first cousin's bride was obliged to defer her nuptials for a week because the *trousseau* was not ready! Only think how unlucky and disappointing."

"But has not Mr. Dunforth explained to you that he is not in a position to marry at present."

Irene looked her dismay.

"No—no! he has not said anything, except that he supposes we must be patient till you are sufficiently recovered to give me away. I suppose it wouldn't look well for you to go to church on crutches. But, don't try and infect him with any of your old-fashioned notions about waiting; pray don't, Noel! Think how frightfully depressing it would be for me to have to go back from Carlsforde to mamma. Here I am treated as a lady, waited upon by the servants, permitted to do as I please; there I am taken to task for all the servant's shortcomings, scolded for the children's faults as well as my own, and mamma is never pleased with anything I do. Oh! Noel, I'd rather die than go back to the old life!"

"But my dear sister, a hasty marriage might bring worse sorrows in its train."

"It couldn't—it couldn't," Irene persisted. "I should at least be mistress in my own home."

"But Clement Dunforth might prove a very tyrannical master; do you forget that?"

"I hate such suppositions?" was the pettish reply. "He would not beat me; he is too much of

a gentleman; nor nag me as mamma does, for he is too manly; and the long and short of it is," Irene added, with a very passionate stamp of her foot, "I am determined not to be put out of conceit of my engagement. If Clement Dunforth had not loved me—really loved me, would he have chosen an ill-dressed, half-educated girl like myself for his wife?"

Noel was silenced, if not convinced, for Irene's argument sounded unanswerable, backed, as it was, by Clement Dunforth's assurance that he was aware of her poverty when he wooed her. He could only suppose that the distrust he still felt it impossible to overcome, was engendered by his own irritable nerves; and, drawing his half-sister to him, he kissed her tenderly, and uttered such a fervent prayer for her happiness, that Irene wept while she hung about his neck, and relieved her warm heart by making all kinds of extravagant promises.

"I shall never forget you, my own dear brother, never be ungrateful to you. As soon as we are rich enough, Clement shall help you to get rich too; and there shall always be a home for you at our house; and I shall go to mamma's once every week to put your clothes in order, and, if you very much wish it, I'll take one of the children off ma's hands."

She was affectionately kissed, and assured that her brother had the greatest faith in the excellence of her intentions, but Noel could say no more. He could not but sympathize with the poor girl, in her unwillingness to return to a life to which Mrs. Estcourt never did anything to reconcile her; yet neither could he look forward to her marriage with any genuine satisfaction. Why had not Clement Dunforth explained to her that it was impossible for it to take place at present? He had been succinct enough with her brother, yet he was permitting her to believe that it only awaited Noel's recovery.

"Perhaps he thinks to break the truth to her by degrees," was the only conclusion at which the anxious invalid could arrive, and, bidding her go and bathe her eyes before her lover's arrival, he was dismissing her, when she surprised him by saying:

"Yes, I'll go and wash away these tears. Has crying reddened my nose? But Clem *is* here already; he breakfasted with us by Mrs. Hurst's invitation. He is at leisure to-day, so we are going to picnic on the summit of yonder hill, under the clump of fir-trees that crown it. I wish you could go with us."

"Mr. Dunforth appears to be making himself quite at home here," Noel exclaimed.

"He does not come without being invited," retorted Irene. "I told you that Mrs. Hurst is charmed with him. What ungracious speeches you do make!"

Noel, ashamed of his ill-humor, once more begged her pardon, and bade her go and enjoy herself. She was nothing loth to obey, but returned ere she reached the door to say, in a cautious whisper:

"Brother mine, do you think Miss Gray is quite truthful?"

"Has Dunforth been poisoning your mind against her already?" he asked, angrily.

"Clem? Why he hasn't mentioned her name to me! It's very odd that you will persist in turning everything to his disadvantage."

"Then, why do you malign Miss Gray?" she was sternly asked.

"Oh, brother! I declare you are growing quite ill-tempered!" Irene complained. "I simply asked if you consider her quite truthful. If she is, why did she speak in such slighting tones of Clem, and yet walk in the shrubbery with him for an hour before breakfast, and let him take her hand? I'll not be sure that he didn't kiss it before they separated."

And then Irene ran away leaving her brother to solve this new riddle, if he could.—To be continued.

COUNTRY SCHOOL-HOUSES AND GROUNDS.

Professor Beal's description of these (Feb. 4) shows them unattractive, uncomfortable and forlorn, as they usually are. In the voluminous report of the French Commission appointed to visit the Philadelphia Exposition and to render a description of American schools and school procedures, M. Buisson speaks with apparent surprise of the *loneliness* of the American school-house. In France, Belgium, Germany, etc., the teacher lives either in the same building or within the same inclosure, and is responsible for the "keeping" of the whole; and this "keeping" is held to include not only external as well as internal tidiness, but some degree of ornamentation; and there is always a garden attached, in which it is becoming more and more the practice to give out-door lessons in plant culture.

This sort of arrangement, however desirable, seems beyond our reach, while teaching is, as at present, a merely temporary occupation—a second stepping-stone toward something else, the first being "*going* to school." But as the population increases, and as the necessity for general and adequate education becomes more and more pressing, the office of the teacher who builds and strengthens those pillars of the republic—"men, high-souled men"—will rise in estimation, and will certainly stand as high as that of the professions of law or physic which may be called in comparison destructive. Then, a teacher who finds congenial occupation in guiding young minds and hearts, will decide to be a teacher *for life*, and will feel safe in making the decision, because then, if old age or disability puts a stop to his work, he will have pensioned support here, as in the older nations of Europe.

Another point of school economy, as to which M. Buisson's report shows equal surprise, is the absence of exercises in what the French call *dictee*, that is in writing (spelling) dictated *sentences* in which the words show their meanings and the manner of use, changes of endings, to suit grammatical concords, and changes of position to best present the sense. Thus the rhetorical and grammatical dispositions of the living words are rendered familiar by the only means of doing so—that is, by *practice*—and the art of punctuation and the correct use of capitals, etc., are similarly familiarized. Besides these advantages, the main object—that of acquiring expertness and precision in spelling—is thereby vastly promoted. What is with us generally the daily toil—the dull, dreary, senseless and stupifying reiteration of the letter-names of columns of dead, isolated, contextless words in the spelling books—becomes not only a comparatively brief, but a lively, stimulating and cheerful exercise—pleasant because it exercises in turn all the faculties of the little learner; all but that of "making a noise." Whole months of time are saved for the acquisition of really useful, mind-expanding and hand-employing practical knowledge, such as cannot be reached at all in our old grandame way of teaching.

The ingenious French have made as great an improvement in the mode of dictation as in the dictation itself. By an ingenious device, which will be described in another paper, they present the pronunciation of the words to the eye without at the same time showing the spelling. Neither do they show any mis-spellings, to confuse the learner by presenting spurious images to his "inner vision" instead of the true forms. Thus all the disadvantages, the noise, the faulty rendering, the waste of time that attends oral dictation are avoided, and the teacher is left free to attend to other classes while the spellers are quietly busy. W.

Purifying Water.—Different waters, like different diseases, require different treatment to purify them; and all waters, no matter how impure they may be, can be made quite pure for drinking or other domestic purposes without distillation, providing the proper materials be used, and sufficient time allowed the reagents to act; but in many samples of water I have found distillation to be the cheapest and quickest mode of purifying them. All filters in use that I am aware of only purify the water from solid impurities mechanically suspended in the water. The following is a description of a filter that I have often used, which purifies foul water from organic impurities as well as from suspended solids. Take any suitable vessel with a perforated false bottom, and cover it with a layer of animal charcoal; on the top of that spread a layer of iron filings, borings or turnings, the finer the better, mixed with charcoal dust; on the top of the filings spread a layer of fine clean siliceous sand, and you will have a perfect filter. Allow the foul water to filter slowly through the above filter, and you will produce a remarkably pure drinking water. Before placing the iron filings in the filter they must be well washed in a hot solution of soda or potash, to remove oil and other impurities, then rinse them with clean water; the filings should be mixed with an equal measure of fine charcoal. If the water is very foul it must be allowed to filter very slowly. The deeper the bed of iron filings is the quicker they will act.

The above is a simple, cheap, and very efficient filter, superior to any other that I know of, and it has the advantage of being free to every one who chooses to make it. I have not taken out a patent for it, and I am not aware of any other person having done so; I think I am the only person who has ever used it. A very good test for the efficiency of any filter is to add some urine to the water before passing it through the filter, and then testing the filtered water to see if the urine passes through unchanged; if it does, then the filter only acts mechanically. The addition of permanganates to water will not destroy Bacteria, but the addition of hydrochloric acid will. If you have to purify water containing Bacteria, you must first add hydrochloric acid to the water till it is slightly acid to test paper; that will destroy the whole of the animalculæ; then add sufficient lime-water to neutralize the acid, then precipitate the lime with oxalate of ammonia, and filter through the iron filter described above. The foulest ditch water, treated as above, is rendered quite pure and fit for drinking. I may mention that I have made it a practice during the last twenty-seven years to boil all my drinking water. It is the safest plan for a man moving from place to place. You cannot always carry a filter and chemicals about with you, but you can always manage to get boiled water; people talk about it being vapid and tasteless, but I am used to it, and like it.—*English Mechanic.*

AN ORIENTAL NOVELETTE.

Under the reign of the first Caliph, there was a merchant in Bagdad equally rich and avaricious. One day he had bargained with a porter to carry home for him a large basket of porcelain vases for ten paras. As they went along he said to the man:

"My friend, you are young and I am old; you can earn plenty. Strike off, I beseech you, a para from your hire."

"Willingly," replied the porter.

This request was repeated again and again, until, when they reached the house, the porter had only a single para to receive. As they went up stairs the merchant said:

"If you will resign the last para I will give you three pieces of advice."

"Be it so," said the porter.

"Well then," said the merchant, "if any one tells you it is better to be fasting than feasting, do not believe him. If any one tells you it is better to be poor than rich, do not believe him. If any one tells you it is better to walk than to ride, don't you believe him."

"My good sir," replied the astonished porter, "I knew these things before; but if you will listen to me I will give you such advice as you never heard."

The merchant turned round, and the porter throwing the basket down the staircase, said:

"If any one tells you that one of your vases is unbroken, do not believe him."

Before the merchant could reply the porter made his escape, thus punishing his employer for his miserly greediness.

The man who "stuck to his colors" was a painter who sat down in one of his paint pots.

Shakespeare probably had the present style of female hair-dressing in mind when he said, "Hang out your banggers."

A Nevada tramp applied to a doctor for some work, and the doctor asked him what he could do. "Well," said he, "I could dig graves."

RECENT LITERATURE.

The Lady of the Aroostook. By W. D. Howells. 12mo, cloth, $2. Boston: Houghton, Osgood & Co.

One who reads a book merely for its startling incidents, extraordinary characters or curiously-contrived plot will be likely to turn these pages hastily and conclude there is little in them. On the other hand, those who delight in seeing pen portraitures of common lives drawn with a master hand; to read recorded conversations with a feeling that the parties thereto, under the circumstances, could have said nothing else; that describes people so fully and clearly we can hardly feel they are creatures of the imagination, will read it carefully and wonderingly reverence the genius that created it. The story is a simple one of a New England girl who, going to meet friends in Italy took passage on a ship, where three young men were the other passengers. The characters are not overdrawn nor the situations improbable. It shows the difference in the situations, manners and morals of the old and new worlds, and that intimate acquaintance may exist between young people of different sexes without resulting in injury to themselves or society. There are hundreds of New England girls who, under the same circumstances, would be as unsuspectingly innocent, and as self-protecting by virtue of true womanhood as was Lydia Blood, and of young gentlemen whose true manhood would insure to any lady the same delicate attention she received from Stanford and Dunham. We are sorry to say that Hicks, poor fellow, is not without his counterpart. In New England, as elsewhere, are sometimes found men, genial, kind, whole souled, who want to be gentlemen, but of whom the demon Alcohol has possession, and for whom there is scarcely a hope left.

We have seldom read a story we more thoroughly enjoyed, and know its other readers will join us in thanks to Mr. Howell for this his last and best contribution.

Practical Instruction in Animal Magnetism. By J. P. F. Dezulé. Revised Edition. 12mo, pp. 524. Cloth, $2. New York. S. R. Wells & Co.

In the early part of the present century the scientific world was much interested in a subject then new and known variously as Animal Magnetism, Mesmerism, Vital Magnetism. It was found that certain persons had the power of relieving pain and curing diseases by making passes with the hands over the parts affected, and not only this, but patients could be put into a sleep during which they were subject to the severest surgical operations without their consciousness.

The discovery of anæsthetics and their introduction to general use seems to have checked investigation in Animal Magnetism, but within a few years past more attention has been paid to it, and it now seems likely to receive the attention it deserves. The republication of the book above named gives an opportunity for those who choose to learn much of this neglected subject. In it the author considers the principles of Magnetism and gives the processes employed in magnetising, treats of Somnambulism, or Clairvoyance; of the application of magnetism for healing purposes, and gives many cases of remarkable cures. The results of the examination of the subject by eminent scientists are such as to leave no doubt as to the value of mesmerism properly applied to many of the conditions of human life.

MAGAZINES.

Contents of St. Nicholas for June.—Frontispiece, "Summer has Come;" A Second Trial, Sarah Winter Kellogg; Mignonette, Poem, Susan Coolidge, (Illustration by Helena De Kay); Bossy Ananias, Louise Seymour Houghton (Illustration by Mrs. J. S. S. Daniell; Chub and Hoppergrass, Charles Stuart Pratt (Five Illustrations by the author); Anna Letitia Barbauld, Kate Brownice Horton (Illustration—Portrait of Mrs. Barbauld); A Jolly Fellowship, Chaps. XV, XVI, Frank R. Stockton (Three Illustrations by James E. Kelly); How the Lambkins went South, Mrs. E. T. Corbett (Illustration by L. Hopkins); Longitude Naught, W. L. Sheppard (Seven Illustrations by the author); The Fairies Gift, Verses, Palmer Cox (Illustration by the author); A Curious Box of Books, H. D. M.; The Schnitzen, M. A. Edwards (Illustration by James E. Kelly); The Shower, Poem, Anna Boynton Averill; A Puzzling Picture, C. B. (Illustration by J. F. Runge); Robin Goodfellow and his Friend Bluetree, Howard Pyle (Three Illustrations by the author); Eyebright, Chapter VI, Susan Coolidge (Illustration by Frederick Dellman); The Boy and the Brook, Verses, L. C. R. (Illustration by J. A. Mitchell); A Fish that Catches Fish for its Master, John Lewees (Three Illustrations by Daniel C. Beard); The Royal Bonbon, Nora Perry (Illustration by Walter Shirlaw); Two Little Travelers, Louisa M. Alcott; How a Comet Struck the Earth, Edward C. Kemble (Two Illustrations—one by George Bell, one by Howard Pyle; For Very Little Folk—the Little Mothers, J. L. (Seven Illustrations by Miss Mary A Lathbury); Jack-in-the-Pulpit (Illustrated); The Letter-Box (Illustration—"Just You Dare!"—by a Young Contributor); The Riddle-Box (Two Illustrations).

A Peripatetic Professor.—Writing of the University of Berlin in Scribner for June, and especially of Ernst Curtius, Mr. H. H. Boyesen thus describes his interesting method of teaching history:

"Professor Curtius has a very agreeable voice and a clear and lucid manner of lecturing; he is frequently in the habit of conducting his auditors through the Greek division of the Royal Museum, and illustrating by the veritable objects many of which he has himself excavated at Olympia, the manner of life and thought among the ancients. It is needless to add that these peripatetic lectures are very popular, being really themselves a venerable tradition from the days of Plato and Socrates. You seem to breathe the breath of Greece. These objects—some of them two or three thousand years old—may have been touched by the heroes who came to participate in the Olympian games. Here, for instance, is an urn or pitcher of burnt clay, or terra cotta, the fragments of which Professor Curtius discovered in an Olympian tomb. It has now been carefully joined together, and no piece was found lacking. The form is light and graceful, and the sides decorated with hasty-colored sketches, representing scenes of every-day life. There is the picture clearly drawn, and the colors yet bright and warm. Notice the wonderful grace and the soft distinctness of the few simple lines which go to make up this figure; and these pitchers were made and decorated by common artisans, not by men who laid claim to the title of artists. Imagine, then, what the average artistic culture must have been among a people whose artisans could draw lines like these. The fact that they are not the work of educated artists is proved by various circumstances: in the first place, the material is very cheap; and, secondly, the pitchers are found in great abundance in the tombs of a certain period. They are a kind of mortuary vessels, which were thrown into the grave, and thus purposely broken; the breaking having some symbolism, and being a part of the burial ceremony. In these lectures, whatever Professor Curtius touches is made to tell, not only its own history, but the history of the people who fashioned and used it. Antiquity revives under his hands, and begins to breathe and move in a human and intelligible manner. We feel our own blood pulsing in its veins, our own emotions and passions animating its actions.

The Voice.—A Monthly devoted to Voice Culture, with special attention to Stuttering and Stammering. One dollar a year. Published at 161 Broadway, Albany, N. Y.

This is a venture in a hitherto untried field. The publishers intend to give prominence to the severer forms of speech defects, and besides will treat of voice culture in an elocutionary and musical aspect. Their aim being to include everything pertaining to the voice, in its perfections as well as imperfections.

THE DIFFERENCE BETWEEN STUTTERING AND STAMMERING.

Most English and American writers use the terms stuttering and stammering synonymously. We, however, think that there is a great difference between them, and give Prof. Klencke's definitions as those by which we shall be governed. The professor draws the parallel as follows:

STUTTERING.	STAMMERING.
I. The stutterer immediately begins to stutter violently when he is observed, and shows a spasmodic fear and oppression.	I. The stammerer usually speaks better when he is observed and thus forced to pay attention to himself, and only under peculiar circumstances does he show fear and oppression.
II. The stutterer does not betray his defect in slow, measured declamation and singing, and in talking in syllabic measure.	II. The stammerer betrays his defect when careless, in singing, declamation and measured talking.
III. The stutterer exhibits an agitation of his respiratory organs, and congestion of the blood in the chest and head, which is increased in proportion to his efforts to overcome the difficulty; and there appears a convulsive action of the chest, throat and head.	III. The stammerer never exhibits an agitation of his respiratory and blood-circulating organs; neither nervous nor convulsive action, and by the exercise of his will he can partly or wholly overcome his defect.
IV. The stutterer can accurately form all consonants as separate sounds without a loud tone, or in a whisper; but begins at once to stutter if he attempts to join certain consonants with voice, or with a vowel. His voice evidently fails by the wrong action of the mechanism of the muscles, respiration and voice-formation.	IV. The stammerer does not have the slightest difficulty in the formation of his voice. He betrays his defect as much in loud talking as in whispering, and the combination of his defective consonants with a vowel meets with no hinderance.—*The Voice.*

Sunday Afternoon (Springfield Mass.,) for June has several seasonable articles; How Civilization Benefits our Birds, which is one of the papers for which that bird lover Ernest Ingersoll is becoming so widely known; a story of the war appropriate to Decoration Day entitled Was He a Traitor; a poem by Thomas L. Collier entitled Decoration Day; and some timely verses by Sarah O. Jewett, author of Deephaven. There is a story, The New Minister at Brayton; a sketch, Letters from Cape Cod; and a somewhat tragic installment of Calvin the Sinner. Mrs. Helen Campbell gives another chapter from her experiences among the New York tenement houses.

Of the more solid articles the longest, from the *Journal des Economistes*, relates to Conflicts of Labor and Capital in England. It traces the history of the English Trades-unions from their beginning to the present time; tells of their organization and numbers, of co-operative societies, of strikes, and discusses these various points at some length. George M. Towle has Republic and Church in France; there are suggestions as to how the Old Catholic movement should be judged by Rev. Dr. Wm. Chauncy Langdon, and Four Elements of a Great Art, the art of imparting ideas as to religion, by Rev. Geo. T. Ladd.

The usual departments conclude the number, the Editor's Table containing: Murder as a means of grace; Materialism in Reform; Is Faith Blind? and American Art.

How Civilization Benefits our Birds.—The result of all this is that the aggregate army of

singing birds east of the Mississippi has been very considerably enlarged during the last two centurics, and is still on the increase. This can only be owing to the fact that by cutting down the forests, etc., man has tempered the rigor of the winter, has multiplied the sources of their food, has appended many additional places suitable for rearing their young, and has enabled them to bring more fledglings to maturity by reducing the ranks of their enemies. This has not only augmented their numbers and modified very appreciably their habits of nesting and migration, their physical natures and mental characteristics, but probably has even changed their voices. There is little doubt in my mind that in making their lives less laborious, apprehensive and solitary, man has left the birds time and opportunity for far more singing than their hard-worked, scantily fed and timorous ancestors ever enjoyed; a privilege a bird is not slow to make use of.

But on the other hand it seems equally certain that the music of our more domestic birds, though greater in volume, is not so sweet in tone as that of their wilder brethern. Our street sparrows are naturally, I suppose, rather harsh-voiced, but whatever they might have been a thousand years ago they could hardly be otherwise now, when the rattle-te-bang of the city pavements has been their only teacher for many centuries. The mocking-bird has learned to imitate the creak of the farmer's wheelbarrow—no dulcet sound—and the scream of the farmer's boy. Many of the sounds constantly uttered by men and evoked by their work are anything but melodious, and young birds born and bred in their midst must surely turn out less sweet and accomplished singers than if reared among the gentle whisperings of leafy woods, and learning music only from the golden-mouthed minstrels of the sylvan choir.—*Ernest Ingersoll in Sunday Afternoon for June.*

THE ATLANTIC FOR JUNE. Contents: Study of a New England Factory Town. Art in Engraving on Wood, W. J. Linton. Rhymes in Many Moods: I. April, Emily E. Ford; II. Avril, Louis H. Frechette; III. Daisy's Fortune Telling, E. M. Bacon; IV. Presentiment; V. Loves, Juliet C. Marsh; VI. Fleeting Youth, Sylvester Baxter; VII. Good-Morrow and Good-Night, John Bolt; VIII. Betrothal, Edgar Fawcett; IX. Archery, Susan F. Wallace; X. Two Views of It, C. P. Cranch; XI. Be Like the Sun, Caroline A. Mason. Physical Future of the American People, George M. Beard. The People for Whom Shakespeare Wrote, I., Charles Dudley Warner. Buying a Horse, W. D. Howells. Recent American Novels. Irene the Missionary, X.-XIII. Dobson's Proverbs in Porcelain, Thomas Bailey Aldrich. The Two New York Exhibitions. A Sunday on the Thames, Richard Grant White. Miss Martin, Annie Porter. The Contributors' Club. Recent Literature.

THE BLESSING OF LABOR.—I believe that for most men more than eight hours' work per day is required for the maintenance of physical, mental and moral health. I think that for most men, including operatives, mechanics, farmers and clergymen, more than eight hours' labor per day is necessary, in order to keep down and utilize the forces of the animal nature and passions. I believe that if improvements in machinery should discharge men from the necessity of laboring more than six hours a day, society would riot in measureless and fatal animalism. I have worked more than ten hours per day during most of my life, and believe it is best for us all to be compelled to work. It would be well, I think, if we could make it impossible for an idler to live on the face of the earth. Religious teachers are not without responsibility for having taught that the necessity of labor is a curse. The world owes most of its growth hitherto to men who tried to do as much work as they could. Its debt is small to the men who wished to do as little as possible.—*June Atlantic.*

THE ECLECTIC for June: On the Choice of Books, by Frederic Harrison; The Egyptian Crisis, by Edward Dicey; On Sensation and the Unity of Structure of the Sensiferous Organs, by Professor Huxley; Mr. Ruskin's Society; The Defense of Lucknow; with a Dedicatory Poem to the Princess Alice, by Alfred Tennyson; Bodily Illness as a Mental Stimulant; The Southern States of the American Union, by Archer Anderson; Contemporary Literature—Biography, Travel, and Sport; Mademoiselle de Mersac, Chaps. VIII. and IX.; Chapters on Socialism, by John Stuart Mill. Conclusion; A May Song; The King's Secret; An Irish Idyll, by the author of The Queen of Connaught; Uphill Work; The Vizier and the Horse; Professor Baird, Secretary of the Smithsonian Institute (with Portrait), by the Editor; Literary Notices—Cassel's Library of English Literature: Plays—Destruction and Reconstruction—The Dawn of History—Wanderings in Patagonia—The Great Italian and French Composers; Foreign Literary Notes; Science and Art: Proceedings of the Geographical Society—Prehistoric Discoveries—Sunspots and Rainfall—Air-Flushing—Electric Light Screens—The Sphygmophone; Varieties: Antiquity of Gloves—A Hymn from the Rig Veda—Mortality—Between two Posts.

EARLY RISING.—A German physician has demonstrated that early rising is a very bad habit. He has taken the trouble to collect information as to the habits in this respect of several persons who have lived to an advanced age, and he finds that in the majority of the cases the long livers have indulged in late hours. At least eight of ten persons who attained the age of eighty years and upward were in the habit of not retiring until the early hours of the morning, and of remaining in bed until the day was far advanced. On the other hand, he has failed to discover, after careful observation of the health of several early risers, that it was in any degree better than that of a similar number of late risers. He thinks that so far from any decided benefit being gained by getting up early in the morning, it rather tends to exhaust physical power and to shorten life.—*Eclectic.*

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

GOOD-NIGHT.

BY MARY H. HIGHAM.

God keep you safe, my little love,
All thro' the night;
Rest close in his encircling arms
Until the light.
My heart is with you as I kneel to pray;
Good-night! God keep you in His care alway.

Thick shadows creep like silent ghosts
About my head;
I lose myself in tender dreams,
While overhead
The moon comes stealing thro' the window-bars,
A silver sickle gleaming 'mid the stars.

For tho' I am far away,
Feel safe and strong
To trust you thus, dear love—and yet—
The night is long—
I say with sobbing heart the old fond prayer,
Good-night! Sweet dreams! God keep you everywhere!

LETTERS FROM A COUNTRY GIRL—No. 13.

Painting in Water Colors.

MARGARET B. HARVEY.

Now that spring has come back to us, and floral beauties again adorn our fields and woods, giving to our amateur artists the most exquisite of models, perhaps I can talk a little while with profit about painting flowers in water-colors. I believe there are hundreds of women all over the land, who wait only for some suggestive leading, who believe they could, and could indeed, paint well, if they only knew just how to get about it.

Well, *try*. Make up your minds to try just as hard as you did to learn that new crochet stitch, or to embroider that tedious yoke. Start out with the determination to make Nature your teacher.

So far, good. You must realize once for all, that though you must ever try to imitate Nature, you *never* can do it. The deeper you penetrate (or think you do) into her secrets, the more will you be convinced that she is as Herbert Spencer says, "unknowable." The best you can possibly hope for is to paint with an humble fidelity at a great distance, making those who see your work *believe* that you have fully attained to the power to interpret perfectly. Having thus acknowledged a limit to your capacities, you have neither room nor right to be discouraged. Select your materials without any more ado.

And I warn you that they are expensive, they will make unjustifiable holes in your pocket-book, unless you are thoroughly in earnest. But, oh,—who can tell the exquisite pleasure of holding a lily on paper, up beside a lily in a vase, observing that the shades, the curves, the veins are so alike that you might almost deceive your own eyes into the belief that they grew from the same root? And when this is all for one dear as your life, what do a few dollars count?

I said you could not imitate Nature, and I say now, that a painting and the model might look alike. There is no contradiction here. The copied flower ought to look like the living one. But there is a vast difference in copying hair-stroke for hair stroke, with a painful exactness, after the manner of counting stitches in Berlin-wool work, and in seizing the general effect, catching and imprisoning the invisible spirit. The first is patchwork, the last art. The first is describing a friend by his hairs and pimples, the last by his soul shining out through his features. You cannot imitate Nature in the sense that you can give contour and texture and line and marking, in every particular, and at the same time retain the character ruling over them; you may, in a certain sense, in that you can, by loving touches, mutely say, "Behold, I suggest humbly, so far as in me lies, that thing of beauty, or its glorified soul, which Earth delights to adorn with her choicest colors, which I would proudly lay at the feet of my one beloved, and which our Lord Himself disdained not to give to us an example."

In painting an anemone, it is enough to tell us that it is an anemone—not that this particular anemone happened to have two spots in a petal, or a swelling on the stem. We do not care for portraits unless there is some special reason why we should have portraits. Give us the general likeness of the species always, save when some individual characteristic towers far above the specific—which seldom occurs in anything short of an heroic human soul.

You have decided to spend considerable of your pocket money—perhaps to do without your usual allowance of cologne and ice-cream and caramels. Very well. Get Whatman's drawing paper, costing fifteen cents a sheet—you must have a thick, stout foundation to bear repeated washings. Sable brushes are ten cents apiece, you may do a long time with one, and I would get a fine one—No. 1. The best colors come in moist pans, varying in price according to the pigment. It is not wisest to get a box of paints, for you will be almost certain to have some which you will never use. Get one pan at a time as you happen to want it—gamboge, vermilion, madder, Chinese white, etc., cost fourteen cents a pan, while carmine, cobalt, etc., run from thirty-five up to seventy-five cents. You will be likely to accomplish satisfactory results if you have the following colors: chrome, cobalt, blue, green blee, (little used) vermilion, madder, gamboge, indigo, (little used) Chinese white, Vandyke brown and black. No rule can be given for mixing, you must work your paints on the palette until you see what you want, and you will soon be surprised at the accuracy with which you can judge. Different proportions of cobalt and gamboge ought to give you any shade of green you can desire, while madder and white will result in almost any pink. And indeed, I can direct you but little, I can't do your work for you. All I can say is, try. If you can draw at all, you must have learned that the golden key to everything is, practice. But this much I insist upon. Never attempt to paint without a flower before you.

Take your flower and *study it*. I think many artists fail just here because they are not, or will not be, for the the time being, botanists. Count the petals, the sepals, the stamens and the pistils, even if you don't put them all in with mathematical precision. Observe the relative lengths of the stems, the curves of the leaves, and the situation of the bracts. Get at the anatomy first. Then arrange your flower as most convenient, stand it in a vase, or pin it against the wall, or lay it down on the table, and see what modifications the light and position produce upon its color, size, shape and whole effect. Note the shadows, the curves, the hues, the veinings and the high lights. Do all this as quickly as possible, even while you draw, for remember, your model is changing every second. Now you begin to understand why you cannot imitate Nature, largely because you can't have her an instant to imitate, yet your memory from moment to moment, and above all, your sympathy, will enable you to put yourself in very close communion with her.

Having finished the outline, rub it all over with bread-crumbs, so as to absorb all the blackness. The bread must not be too stale, or it will scratch the paper, nor too fresh, or it will smear it. Next make a mixture of the leading colors and wash in a thin coating of each for a ground work. Now perhaps you will have an opportunity to exercise your patience, for you must not attempt to do anything more in a particular spot until it is perfectly dry, you may fill in the time by working in another part, or by studying the model, or by mixing the colors you will want next, taking care to have them match, as nearly as possible, those in your flower. Alas, how feeble is man! The brightest pigment he can manufacture is dull when placed against its supposed counterpart in Nature. Ah, that unapproachable example!

When you have put on a second, perhaps a third or fourth coating of the local color, and when in the broad mass, your flower begins to resemble the living one, you must work in the touches which will give your flat daubs roundness and fullness, and transparency and delicacy and naturalness, but just how, you know, or can know, or if you don't and can't no one can tell you. By your own persistent effort alone can you discover where and how to shade, and to spread and to lighten, where and how to lay on your brush leaving broad strokes, or twisted masses, or tiny hair-lines. But it may take you a whole summer to find it all out, don't be afraid of time, for by persevering, you can conquer it. Your only guide is the model—work on, until you can paint something whose entire effect resembles it.

A flower painted on neutral-tinted paper will stand out much more life-like if you put in the shadow which it casts. Make this just as you see it beyond the model according to the position in which it is, and in which you view it when so placed as you would be looking at the picture held in the most natural way. I mean, if your flower lies flat on the table, don't put in the shadow as it would appear if you stood so as to see more stem than anything else. The best way to regulate all this, I think, is to stand the flower in a vase to paint, and hold a sheet of paper behind it to catch the reflection, then you get everything as it would most nearly represent an illustration in the page of a book, or a painting framed on a wall. As to the hue of the shade, make it a soft, pale gray, produced by mixing white and black.

Now, what do you want to paint? Fans, mats for *passe-partouts*, Christmas, New Year and birthday cards? A very slight proficiency will be enough to give an exceedingly high degree of satisfaction in these simple things, handkerchief-boxes, satin-covered bottles for toilet-sets, albums and then pictures. How lovely to think of a beautifully yet inexpensively-furnished room, adorned by the taste of the lady herself from the fairy sweetness she found in the woods. I am sure that such a boudoir is somewhere.

RUGS.

MRS. J. E. S.

Now that rugs are fashionable as well as useful, it may not be out of place to say a little about them. They are decidedly useful to lay before the stove, the bureau, the mirror, the couch and the large chairs that are much used: First, to preserve the carpet in those places if it is new, or, if it is worn, to cover the worn out or worn off places; and second, because of their additional warmth in cold weather. They are made in various ways, of various materials and in various styles. Some are oblong, some square; some are round while others are oval. The form depends on the material out of which the rug is made, and the place for which it is designed. Before a couch an oblong one is desirable, while in front of a stove an oval one does nicely. A few are quite elaborate and seem altogether too nice to be trampled upon—others have a comfortable look and the feet are quite at home on them. Rugs are made of such a wide range of material that everybody can afford one of some kind, if they have genius enough to utilize the material that they have on hand. Leaving the elaborate, the ornamental and the expensive ones, I hasten to explain how rugs can be had without paying out money. To make a "*caterpillar rug*," take all the little bits of all kinds of cloth in all colors and cut them into strips one-half an inch wide. Then with a strong thread and coarse needle make a row of stitches through the center of each piece separately, lengthwise; then draw the thread until the cloth comes close together. After several pieces are thus "strung" and drawn together, twist them slightly and trim; when trimmed, their resemblance to the caterpillar gives the rug this name. After all the cloth is thus strung, take something for a lining and sew the several strings upon it. Begin in the center and sew round and round closely together until you have the size desired. In this way you get a "hit and miss" effect; of course one can arrange her colors according to her taste. I have a rug with a center all hit and miss, then two rows of black, two rows of hit and miss, finished with three rows of black. Another that I have is oval in form, with each row cut and sewed so as to have no break in the rows. It has a center of three hit and miss rows, then one brown and one black, one hit and miss, two brown, another hit and miss, finished with three black rows.

The *crocheted rug* is made by tearing or cutting the cloth into strips, then sewing them together the same as for rag-carpet. The cloth thus prepared is crocheted similar to crocheting thread mats and tidies. This kind of rug does very well but is not as durable as the caterpillar one, neither is it so much trouble to make.

The *braided* rug, however, is the most durable, and although considerable work to make, it is not difficult. The cloth is torn or cut into strips, then braided into a flat braid consisting of three strands. The braid is sewn together good and firm with a strong thread into an oval or round form. I have an oval rug 33x49 inches—that has been in daily use six years, and is still so good that it will probably be serviceable two years longer. In making a rug, if you keep in mind that the better it is made the longer it will last, you will be more pains-taking and somewhat less in haste to finish it up at once and get it on the floor, just to see how it is going to look.

Still another kind of rug is made from the "mild cloes." Take a coarse burlap lining, cut your cloth into narrow strips, and with a strong hook draw the strips through the burlaps and cut, leaving the ends an inch or so upon the upper side of the burlaps which has already been fitted to a frame similar to the way quilt linings are fitted. The rags are drawn in so closely that the rug is thick, warm and durable. This style of rug is generally oblong and mostly made in diamond pattern. A variety of rags, ravellings from woolen stockings and knit goods work up in these very well. I might enlarge upon the material used, and upon the manner of making rugs, but as I set out to write more particularly about those, the making of which would not involve the paying out of money, I conclude by saying that a bare floor with a rug or two on it is cool and comfortable for the summer's heat that will soon be here.

THE SUCCESSFUL HOUSEWIFE.

S. B. SAWYER.

THE first step towards success must be learning to love the work. If a girl brought up in the city and used to the ways of city life marries a thrifty young farmer and undertakes to do the house-work necessary for her to do, or to over-see it done, she may be astonished to find it disagreeable. Thinking, in her innocence, that she is willing to do anything for him she loves, she by degrees finds she is not. Tired, discouraged and heart-sick, she longs for her old home, but knowing she has chosen her lot and must abide by her choice, she assumes an indifference to her work which soon becomes a reality and she plods around as a machine might, could one be invented to do house-work. Her husband knows things do not go right in the house, but can devise no means to better them and also grows indifferent, and when children begin to add their noise to the general confusion, he flees to the field by day and the village store by night, and the poor wife has another grief to add to her catalogue of woes. By learning to love her work the young housewife (and old one too, perhaps,) may avoid much misery of mind and body—I say of body—for we well know the body sympathizes with the mind and often one feels sick, when one is only worried. The farmer's wife has much work to do that the mechanic's wife knows nothing of. It amuses me to hear women tell how much work they have to do, and when you get at the root of the matter, they hire their washing done; hire their dresses cut and perhaps made, and have no milk to take care of!!! I sometimes wonder what they would do if the care of the milk of half-a-dozen cows was added to their work. We farmers' wives have one advantage. We can see nature in all its beauty. Our work requires us to be up in the morning with the birds, and as we step about skimming milk, working up butter, washing and scalding pans and pails, no one can hinder our drinking in the beauty of the morning, but when tired (and shall I say it *cross*), we wilfully deny ourselves a glance out at the open door, and when husband comes in fresh from the dewy fields and while tracking our clean floor woefully, speaks of the fineness of the morning, we see only the dirty boot marks and answer accordingly, we have not learned to love our work. There is nothing that will help us so much as a hearty, genuine love for what we are doing, and I believe that love, may be born, reared and matured wherever we find our life-work. If we consider ourselves martyrs, drudges, overworked women, &c., &c., we cannot be successful. Our work requires an earnest, thoughtful, loving spirit, a patient but energetic persevering hand, and a pleasant, smiling face.

POUCH FOR CLOTHES PINS.

ONE of the latest conveniences, which I have noticed for housekeepers, is the apron for clothes pins. It is a trivial affair, but nevertheless quite useful. It takes nearly one yard of calico to make it, the apron or pouch being fifteen inches in length and nearly as wide. Round the corner at the bottom. At the top, on each side of the front, two inches from the middle, cut out a strip nine inches long and one and one-half inch wide for pockets. Bind them with lighter colored fabric than the apron, that they may be readily seen. Gather into a band and button at the back, or, if preferred, put on strings and tie.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

MY NEIGHBOR'S BREAD.

MARY BEAL M'LOUTH.

"Mrs. Kindness, I am dreadful sorry to come borrowing the first thing after we moved here, but your boy was at our house this morning, and I heard him tell my Johnnie that *his* mamma never had any poor victuals, and I thought, 'Now there's my chance,' for it's been such cold weather that I have had two bakings of sour bread in the house now, and our flour is all gone, and a fussy aunt of mine, who was never known to have anything wrong, has come to see us and brought two city cousins right from Boston, and I know they'll think my taste wretched poor because I don't make yeast bread, and besides, we expect woodcutters this afternoon, and oh, dear! I didn't know what to do, so I just came over here to see if you could help me."

"Why, bless you! child, you are welcome to some bread, if that is all. *I* never eat yeast bread, either, but husband likes it best, and I made some yesterday, so you can have enough to supply your present wants. But you look so tired, do sit down and rest in this easy-chair, and we will see what can be done for your future needs."

"Well, this is a comfort I don't get every day, for we have but one easy-chair in the house, and that is in the parlor, where *I* don't get a chance to sit down very often."

"This is all the easy-chair I have, Mrs. Trouble, but I think if *any* one needs such a piece of furniture, it's the busy housekeeper, when she does get a chance to rest."

"I believe that is so, but I'm in an awful hurry, so please tell me how you manage never to have any sour bread."

"My dear, good woman, I am a little older than you and have had a trifle more experience, perhaps. When first married, I had many misgivings as to my abilities, but succeeded in having good bread the first year. The next our wheat was very poor, and I had as long a siege of perplexities as you have just named. The two maxims, 'Practice makes perfect' and 'Perseverance conquers all things,' are worth a small fortune. Don't you think so, Aunty?"

"Indeed they are, and I think if housekeepers made their work a study and were not afraid to ask questions, as our neighbor has done, there would in the future be more good cooks, more tables laden with plain but wholesome food. If the whole world had been more temperate in all things, there would not to-day be so many melancholy, broken-hearted people fighting that dreaded disease, dyspepsia. It's of little use for invalids to take medicine when they continue to live on rich pastries, puddings and hot rolls, to say nothing of meats which are seasoned so highly as to be very unwholesome, besides destroying the natural flavor. I hope, Mrs. Trouble, you will get directions for cooking with Graham flour of my niece, for her receipes are all good."

"I should be very glad to, I am sure. And now, Mrs. Kindness, I'll listen to you and try and remember your directions."

"Very well; I will first of all tell you, briefly,

"How to Make Scalded Rising.—It is sure, and I don't believe you will have any more trouble. You want a pinch of salt and two spoonfuls of cauaille. Pour just enough boiling water on to wet it, and beat until the lumps are all out, just as you would make flour starch, thickening for gravies, etc., with *cold* water. Then put in a trifle more water, and stir again, repeating until it is about the consistency of griddle-cakes. In this way it can be made in a moment's time, but if you stir in all the water at once it takes much longer to mash the lumps. Set on bricks over the oven, and at noon stir thoroughly. If kept very warm, it will be light at night or the next forenoon. Then put in a pitcher two cups of warm water, all the flour you can stir in, salt, and two spoonfuls of the scalded rising off the top of what is in the bowl, throwing away the watery substance in the bottom. Beat three minutes and set in a pail of warm water. This will rise in two hours. When light, take out a good large cupful for Graham bread. For the sponge, pour on the fine flour one pint of boiling water, cool with one pint of milk, put in your flour emptyings, rinse your pitcher and beat all together hard. Sprinkle over a little flour, cover and put in a warm place. I always salt my bread, for I think it helps to keep it moist. The lighter the flour emptyings and the sponge get, the whiter the bread will be. But don't let the loaves get too light, and if you do not want the bread to be porous, and wish to keep it moist a week, mix the loaves pretty hard, or so they will keep their shape. Most people bake bread too long, or with too much fire. After I set this sponge I take one small pint of warm milk, one-half cupful of sugar, one large cupful of rising, and stir in Graham flour until as thick as common stirred cake, Put in a deep bread-dish and let stand until light. The top will be flat. If it rises higher than the edge of the tin it will run over when baking. Like cake, it is best baked on the lower grate first—unless *very* light—and finished on the upper. Bake until a good brown, and try with a broom splint.

"Graham Bread No. 2.—Two and one-half cups of buttermilk, one-half cup of cream—unless the buttermilk is very rich, one-half cup of sugar, salt and soda, and Graham flour as above. If thin, it will settle when done, and if too thick, so that there are little bunches on the top when baked, it will be dry and taste too 'branny.' If the flour is ground too fine, the bread will be sticky. Avoid these mistakes, and you will have bread the whole family will call for.

"Dyspeptic Bread.—One and a half cup of sweet milk, two-thirds of a cup of sweet cream, salt, and three cups of Graham flour. Bake in a very hot oven, in gem irons which have been greased and heated, first on the lower grate and then on the upper, until of a rich brown. Take out on a plate and partly cool before eating. If you do not succeed the first time, follow directions for thickness of Graham bread No. 2.

"Stirred Biscuit.—Two cups of buttermilk, one-half cup of butter or one cup of cream, salt and soda. Stir in all the flour you can, and drop on buttered tins. Bake in a quick oven, so they won't spread, or, what is better yet, in gem pans, for then you don't need so hot a fire."

"Sakes alive!" says Mrs. Trouble, "I can't remember all that."

"I'll write it down for you if you wish."

"Oh, do; but I must go home. Good-day. Much obliged for the bread."

DOMESTIC RECIPES.

Currant Ice.

Add to three pints of water one pound and a half of sugar, boil until reduced to a quart, skim and add two coffee-cups of currant juice. When partly frozen, stir in the beaten whites of four eggs.

Tea Ice-Cream.

Scald four tablespoonfuls of Hyson tea in a pint of sweet cream—it is best to scald it either in a custard-kettle or in a tin pail placed within a kettle of boiling water. When partly cool, strain it into a pint of cold cream, bring to a scald and stir in four beaten eggs and three-quarters of a pound of sugar. Let cool, and freeze.

I have found that in making water-ices, if the sugar be not well stirred in before freezing, it will sink to the bottom and give the mixture a sharp, unpleasant taste. It is best to make a syrup of the sugar and water by boiling, and when cold, to add the pure juice of the fruit.

MARY B.

Strawberry Sauce.

One and a half teacupfuls of sugar, half a teaspoonful of butter beaten to a cream; then stir in a pint of strawberries mashed until juicy, and the beaten white of an egg. Nice for puddings. MRS. BRADY.

Gooseberry Jam.

Simmer the fruit in a very little water, press through a sieve and return to the kettle. Then add to each pound of the pulped gooseberries three-fourths of a pound of sugar and boil one-half hour, stirring constantly. MRS. TERRY.

Ginger Beer.

A cooling summer drink is made by adding to six quarts of water one pound of sugar; one ounce of cream-of-tartar and one bottle of Jamaica ginger extract. Put over the fire and stir until the sugar is dissolved, but do not heat. Take from the fire, add a teaspoonful of good brewers' yeast; stir together, bottle, and wire the corks.

It will be fit to drink in two or three days.

MARY B.

News of the Week.

MISCELLANEOUS.

Monday, May 26, 1879.

Tilden seems likely to be remined of his income-tax for some time to come. Thomas Harland and William P. Healey, the lawyers who spirited away from the court-room at Marquette last fall the books showing his income from the New York mine at Negaunee, Mich., have been indicted by a Michigan grand jury. The death at Philadelphia of Judge Asa Packer, of Mauch Chunk, Pa., removes one of the most prominent of the "coal barons." He had long been president of the Lehigh Valley railroad, and as such was one of the pillars of the old coal combination, but to him more than to anybody else in that monopoly was due its final disruption. His age was 72, and the accumulations of his long and active business life are very large. Ohio's Legislature has been in session so long that the treasury is drained of money to pay the State officers, and from the governor down to the Solons themselves no one can draw any cash until further appropriations are made. William Lloyd Garrison has just died in this city.

The news of the veto of the anti-Chinese bill by President Hayes excites conflicting comments in China. Americans throughout the country express satisfaction at the rejection of so summary a plan for disposing of the question at issue; Europeans merely evince surprise, having in most cases anticipated different action; while the Chinese differ among themselves. In the immediate neighborhood of Hong Kong, the port of emigration, where the friends and relatives of the Chinese now in America live, much gratification is shown, and the notion appears to prevail that future persecutions are impossible; but there is no indication of increased departures. Around Shanghai the populace are apparently indifferent, and the officers reticent. It is believed that the veto is not received with unmixed pleasure at Pekin, as the goverment, it is thought, would have been glad of an opportunity for inaugurating an extreme anti-foreigner or anti-American policy.

During the ten years of work upon the Sutro Tunnel in Nevada, the lives of the operators have been carefully guarded, and but five or six deaths by accident have taken place. During the boring of the Hoosic Tunnel 185 men were killed, and the accidental deaths in the St. Gothard Tunnel have averaged one a day, and in the Comstock one a week. The low rate of accidents in cutting the Sutro is attributed to the strict system under which the work has been carried on. The contempt which is bred of familiarity is the real cause of most explosions.

Mrs. Kate Cobb and Wesley Bishop have both been sentenced to State prison for life for the murder of Mrs. Cobb's husband; Mrs. Jenny Smith and Covert D. Bennett were on Saturday found guilty by a jury of having deliberately murdered Mrs. Smith's husband. Mrs. George H. Mack of Rock County, Wisconsin, is in State prison for life for the murder of Mr. Mack, and Frank Dickerson, Mrs. Mack's boy paramour, on whose testimony Mrs. Mack was convicted, is now on trial as an accomplice in the murder. In Lowville, in this State, Mrs. Harriet Merrihew is in prison for the murder of her husband's brother, and attempted murder of her husband, whose life was fortunately saved by the timely dismissal of Mrs. Merrihew from her position of nurse of the sick man. Mrs. Merrihew has confessed her guilt, and her alleged accomplice is under arrest. A singular feature of all these cases is that there is no pretence that the victims were otherwise than good husbands.

Col King, a Texas cattle man, has a fence 75 miles long, enclosing about 337 square miles, on which range 110,000 beasts. The House Committee on Agriculture will, at the first opportunity, report a bill to give growers of tobacco the right to produce it in any quantity and for any purpose free of taxation. The bill is opposed by the Internal Revenue Bureau and the manufacturers of tobacco. Mr. Kimball, Chief of the Tobacco Division of the Internal Revenue Office, says that the bill, if passed, will be disastrous to the States where tobacco is grown as the money crop of chief agricultural product. He says that tobacco can be grown without difficulty in most of the States of the Union, and if it can be disposed of, exempt from all taxation, either special for selling or specific, farmers everywhere will engage in the cultivation of the plant. Consumers can buy the leaf direct from the producers and manipulate it themselves. They can thereby avoid payment of the tax of sixteen cents per pound on tobacco which is granulated for smoking, or twisted by hand for chewing, and also the tax of $6 per 1,000 on all home-made cigars. Manufacturers oppose the bill, because it will, if it becomes a law, greatly diminish their business. The Treasury authorities are opposed to it, because it will diminish the revenues. Tobacco producers everywhere desire the passage of the bill for obvious reasons.

The regular order in the Senate to-day is the consideration of the bill relating to the transportation of animals, reported favorably from the Committee on Commerce. The bill is of interest to humanitarians as well as cattle dealers in the East. It provides that cattle, sheep, swine, or other animals shall be unloaded for food and water, and seven consecutive hours of rest once in every twenty-eight hours. When comfortable cars are provided for transportation of live stock, and the animals are well fed and watered once in every twenty-four hours, the animals may be confined in cars for sixty consecutive hours, without unloading for rest. Severe penalties are provided for violations of this act, and the carriers of the animal are required to execute the provisions of the bill if their owners do not. At present cattle are brought from Chicago to New York, a ride of nearly four days, without being fed or watered. When the animals reach Jersey City, they are half starved, feverish, and in this condition are slaughtered. The meat is not perfectly healthy, and will not keep well. Mr. McPherson's bill was adopted by the Senate at the close of the last session of the last Congress, but it failed to pass the House because of the expiration of the session.

FOREIGN.

India is one of the sore spots of the world just now. Famine, pestilence and misgovernment in the Punjaub, the Deccan and Bombay have been followed by riot and threats of the massacre of officials and Europeans. These evils usually appear in their most aggravated form in India, the people being improvident, their products and industries lacking variety, and their rulers having too little interest in their welfare. They suffer, too, from the general business depression of the world, and the silver question affects their interests more perhaps than those of any other people. Garibaldi, the Italian patriot, has decided to live permanently in Rome. Full reports from the correspondents with Lord Chelmsford's force, which marched to the relief of Ekowe, make a bad showing for the English troops. The attack upon the relief force was made by an inferior force of Zulus, one of the first instances on record in which a white disciplined force of large numbers has awaited the attack of savages behind intrenchments. After the attack, in which the Zulus showed a gallantry the British officers say they never saw equaled by British troops, the Zulus retired in good order, and with a trifling loss from pursuit, although they were unprovided with cavalry, and Lord Chelmsford had a comparatively strong force. The British commander, according to the London Times correspondent, contented himself with "confending the impudence" of the inferior force which was charging to the edge of his intrenchments. The same correspondent, by the way, pronounces the men making up the British line mere boys, without the stamina to stand a campaign.

England has one great place of agricultural education—Cirencester College. It is erected in an elevated spot, facing Lord Bathurst's immense and splended park in Glostershire, while its south front has a wide view of Wilts. It contains accommodation for eighty-five students, a museum rich in specimens of geology, botany, &c., and near by is one of the best laboratories in England, formed out of an old barn. The farm buildings are on a very extensive scale. Gentlemen distinguished in the sciences connected with agriculture, in addition to the regular staff, give lectures. The college is now thirty years old. Mr. Pusey, a leading agriculturist (elder brother of the Doctor), was one of its main promoters, and the undertaking was carried out at the instance of the Royal Agricultural Society of England. The Prussian Government appears determined to make sure that the army shall not, like the French soldiery, be permeated by the leaven of democratic ideas. The troops stationed in Berlin have been forbidden to read the liberal newspapers, and their quarters are to be searched at regular times for the prohibited journals and for other objectionable publications. Severe punishment is promised those with whom such articles are found.

Murray & Lanman's Florida water.—The most delicate invalids, the greatest sufferers with sea-sickness, and those whose nervous systems are most sensitive, prefer it before all others, and use it to the exclusion of all others, not for a time only, but always and continuously. The sense of smell never tires of its soft, refreshing odor.

Ladies, do you want to be strong, healthy and beautiful? Then use Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 24th, 1879.

Beans and Peas.—The export demand for marrows is steady enough to support late prices, with extra qualities a trifle higher. Since Sept. 1st, 1878, to date the exports of beans add up 42,800 bbls.: this total is considerably in excess of previous three corresponding periods. Mediums move fairly. Red kidneys in few hands and firm. White do and pea quiet; a few selected of the latter made $1.37½. Black beans a shade firmer. Green peas in light stock; firm at $1.80@1.85. B. E. peas dull at $2.50 per 2 bush. bag. Canadian, in bulk and bond, 75@77c. Beans, marrow, prime, $1.37½@1.40; fair to good, $1.25@1.35; medium prime, $1.30@1.32½; fair to good, $1.20@1.25; pea, $1.20@1.35; white kidney, $1.30@1.50; red kidney, $2.85@3.10; black, $2.15.

Butter.—Supplies have materially increased, but prices have held up extremely well. Up to this week the offering has not been over free, and with what exporters have called for and the demand for other outside use, in consequence of the late spring, there has been a steady outlet. Now, as we approach the grass season, it will be difficult to handle streaked or white lots. At this time local buyers especially regulate their purchases in keeping with lowest requirements. There may be consequently a glut, as the West continues liberally, and weak general quotations may be expected. A good export demand is promised, but as last season taught the buyers low figures, a cheap basis will have to be conceded. The annexed range does not vary much from last week, but at the close inside rates are as much as the market will stand for wholesale business. State tubs and half tubs, choice, 15@16c.; good to prime, 14@15c.; fair to good, 12@14c.; Welsh tubs, choice, 15@16c.; good to prime, 14@15c.; fair to good, 12@14c.; poor, 8@10c; State creamery, best invoices, 18@18½c.; good to prime, 17@17½c. sweet cream, best, 17@18c.; fair to good 15@17c; Western, best invoices, 18@19c.; good to prime, 17@18c., fair to good, 15@17c.; imitation creamery, 13@16c.; dairy, best invoices, 14@15c.; good to prime, 11@13c; fair to good, 10@11c.; poor to fair, 8@10c.; Western, factory, best invoices, 12½@13c.; good to prime, 10@12c.; fair to good, 8@10c.; poor to fair, 6@8c.; grease butter, 3@4c. Receipts for week, 31,910 pkgs.; do. last week, 24,582 do.; exports for week equal 6,027 firkins.

Beeswax.—There have been small sales at 24@25c. for Western and Southern.

Exports for week, 5,000 lbs.

Broom Corn.—Offerings fair except of brush, and manufacturers not doing much.

Brush and short broom, choice, per lb., 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

Cheese.—Exports for the week, 35,135 boxes; this increased movement has been at decidedly higher prices. The marked advance at the country sales, and the better English markets have tended to the enhanced vigor. Shippers have about confined buying to the choicest grades, paying 7¾@8, and occasionally 8. At the close prospect of early larger supplies tends to rather less strength.

Quoted for new factory: 7¾@8c. for best; 6½@7¼c. for good; 4@6c. for half skimmed, and 2½@4c. for skimmed; dairy at 6@7c. for good and fine; 5@6c. for fair to good, and 4@5c. for skimmed: Western factory at 7@7½c. for fine; 4@5½c. for half skimmed, and 2½@3½c. for skimmed, and for old as follows: 7@7½c. for fine lots; 6@6½c. for good; 6@6½c. for fair; 2@3c. for skimmed, 4@6c. for half skimmed; Western factory, good and prime, 5@6c.; do. full skimmed, 2@3c.; do. half skimmed at 3@4c.

Liverpool quotation for new, 41s.

Steam, 32s. 6d.

Cotton.—Early in the week a further sharp advance was made, but for two or three days there has been pressure to sell and prices lower; latest prices are for May, 12.94@12.96c.; June, 12.97@12.99c.; July, 13.15@13.16c.; August, 13.29@13.30c.; September, 13.05@13.06c.; October, 11.8c.; November, 11.32@11.33c.; December, 11.25c.; January, 11.27@11.29c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas.*
Ordinary	11 11-16	11 13-16	11 13-16
Strict ordinary	12 1-16	12 3-16	12 3-16

STAINED.

Good ordinary	11⅜	Low Middling	12 9-16
Strict good ordinary	12⅛	Middling	12 15-16

Dried Fruits.—The general market is spiritless, as usual, at this period of the year; in apples there is a fair jobbing trade in evaporated, but beyond this nothing of moment done, and peaches and small fruits generally are somewhat nominal. Following are the quotations:

Apples—evaporated Alden's & William's 10@10½c.; do. new process at 8@8½c. State plums, 12@12½c.;

Blackberries quoted at 4¾c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., 8½10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2¼@2½c. for Southern quarters in bags; 3½@4c. for prime sliced: do., fair and good, 3@3½c.; State at 3@4c. for new sliced; and 3@4c. for quarters: Western at 3@4c for new quarters. Raspberries, 30c.

Exports for 252 bbls. apples.

EGGS.—Receipts for week, 11,380 bbls.; do. last week, 13,261 do. There has been a low tone to the market throughout the week, and the close shows no improvement. Buyers demand "loss off" for Western and obtain reclamations in some instances.

Near points, dozen, 12½c.; State and Penn., 12c.; best Western, 11@11½c.; second grade, Western and Southern, 10@10½c.

FRESH FRUITS.—A few choice marks of apples keep firm, but the bulk of the remnant is weak even at an easy range. Ice-house Baldwins, $3@3 50; prime State and New Hampshire Russetts, $2 50@3; other parcels, $1@2, as to condition. Strawberries are down to popular prices. Size and flavor greatly improved since last week. Del. and Md. 10@15c.; N. C., 10@14c.; best Norfolk, 11c.; poor to fair, 3@6c. qt. Georgia peaches will be in market next week; one crate has arrived. N. C. Cherries, common to choice, 9@16c. lb. V. gooseberries, bush., $1 50. Hothouse peaches, doz., $6@7; do., grapes, B. Hamburg, $1@1 25 lb. Peanuts quiet, holders willing to shade late figures. Va. hand-picked, $1 37½@1 37½; other, $1 10@1 25. Pecans, 6@8c. lb.

CORN MEAL.—Sales at $2.50 for Brandywine, and $2.10@2.35 for Western yellow.

FLOUR.—It has been necessary to reduce prices to effect business on the larger supplies and lower wheat market.

Latest sales are at $3.40@3.90 for inferior to very choice superfine State; $3.75@4 00 for poor to good extra do., odd lots and lines; $4.00@4.25 for good to choice do.; $3.35@3.90 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.65@4.00 for inferior to good shipping extra do., and $4.00@4.35 for good to choice extra do.; common to about choice white wheat extras, $4.35@5.45; choice to very fancy do. at $5 50@6.75; red and amber winter wheat, inferior to very choice grade and family, at $4.35@6 25; round hoop Ohio at $4.10@4.35, and trade and family brands of do. at $4.35@6 25, the latter rate for strictly fancy; St. Louis, $4.40@5.50 for inferior to good extra; $5.50@6 35 for good to very choice (with very fancy brands up to $6.75); Minnesota clear, very inferior to very choice, at $3.65@4 85; Minnesota "straight," very inferior to strictly choice at $4.35@5 85; and very fancy as high as $6.25 asked, and patent poor to strictly fancy at $5.40@$8.15, few brands going above $7.50@7.65. unsound stock at from $3.25@5.25; city mill extra at $4.10@5.25 for West Indies (the latter rate for fancy in new packages); do. for England and $5.70@4 00; do. trade and family extras, $5.25@6 25; do. for South America, $5 35@6 for fair to very choice; No. 2 at $2.35@3.25 for very poor to strictly choice.

GRAIN.—Wheat has generally tended lower, the No 2 red grade alone excepted, which is under speculative control and wanted for contract delivery. Latest sales are of; No. 2 spring at $1 03@1 04½; No. 3 spring at 92@96c.; rejected spring at 75@76c.; ungraded spring at 87@96c.; mixed winter at $1 15@@1 16½; ungraded amber at $1 15@1 15½; No. 2 amber at $1 15@1 15½; ungraded red at $1 10@1 15; No. 2 red at $1 18@1 18½; white Canada in bond at $1 11½; ungraded white at $1 11½@1 13½; No. 2 white at $1 12@1 12½; white State at $1 15@1 15½; No. 1 white at $1 13@1 13½; New York No. 2 spring, May option, at $1 04½; do., June, at $1 05; do., July, at 1 06; No. 2 red, May option, at $1 18½; do., June, $1 17@1 17½; do., July, at $1 16½; do., August, at $1 13@1 12½; No. 1 white, May option, at $1 13½; do., June, at $1 15½. Rye active at decline; sales of State at 62@63½c. and No. 2 Western at 60@61c. Corn is unsettled, favoring buyers and fairly active; latest sales of New York No. 1 at 46c.; New York No. 2 at 45@45½c.; New York steamer mixed at 44@44½c.; No. 3 at 43@43½c.; New York No. 2 old at 45½@45¾c., mainly at 45½c.; ungraded Western mixed at 44@44½c.; do., yellow, at 46c.; New York No. 2, May option, at 45c.; New York No. 2, June option, at 44½@44c.; New York No. 2, July option, at 45½c.; New York No. 2, August option, at 46@46½c.; New York steamer mixed, May option, at 45½c.; do., June, at 43½c. Oats are active and higher; latest sales of New York No. 2 white at 38½@3 ½c.; do., July option, at 35½c.; New York No. 1 white at 40c; New York No. 3 white, 37½@37½c.; New York No 1 at 35½c.; New York No. 2 at 35c.; do., July option, at 35½c.; New York No 3 at 33½@34c.; white Western at 34c.; mixed do. at 34@35½c.; mixed State, at 37@38½c.; No. 2 Chicago afloat at 35@35½c.; do., in store, at 35c.

HAY AND STRAW.—The receipts are small, demand good and prices generally favoring sellers.

Sales at 45@55c. for shipping, and 75@90c. for retail qualities. Straw at 45@50c. for long rye; 40c. for short rye, and oat at 30@40c.

Exports for week, 562 bales.

HONEY.—Clover comb offered, 6@8c.; buckwheat, 5@6c.; strained, 5@7c.

HOPS.—Emmet Wells says: brewers have been moderate buyers this week but exporters have for the present withdrawn from the market. Five to twelve cents is still the ruling price, the latter figure being reached only in extreme cases. It will be seen by the reports published from our exchanges that the reduction of hop acreage, of which there has been a good of talk, will be small, and hardly sufficient to affect prices favorably next fall. With the prospect of another season of ruinous prices growers will give very little attention to their yards, and the range in values will be even wider next season than now.

	Bales.
Receipts for the week	682
Total receipts since Sept. 1, 1878	63,465
Total receipts for same period in 1877	129,110
Export clearances for the week	none.
Total exports since Sept. 1, 1878	25,981
Total exports for same period in 1877	75,097

Quotations are for New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 6@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@12.

OIL CAKE.—Quoted at $27.75@28 per ton for western.

MAPLE SUGAR.—Supply not large, but the season is advanced and prices will not be apt to improve. Fair to best, cakes, 7@9c.; sirup, 75c. gal. in tin.

POULTRY AND GAME.—Live fowls scarce and high. Prime spring chicks in demand. Some sales now by the lb., at 25@35c. Many of the arrivals are too small for use. Choice good-sized sell quicker at $1 pair than poor at 50c. Good hen and tom turkeys have a place.

Chickens, spring, per pair, 50c.@$1 12. Fowls, Jersey, per lb., 13½@14c.; western, 12c.; southern, 12@12½c. Roosters, old, 6½@7½c.; Turkeys, western, 12@13c; Ducks, Jersey, N. Y. and Pa., per pair, 65@75c.; western and southern, 50@65c.; Geese, Jersey, $1 50@1 75; N. Y. and Pa., $1 25@1 50; western, 75c.@$1; southern, 75c@87c.; pigeons, 40c.

The offering of dressed is down to almost hot weather limits. Prices fair, but as the demand is more or less special at this time, transient or remote shippers have little interest in the market here.

Turkeys, prime, small, 16@18c; fair to good large, 13@14c.; Chickens, spring, dry-picked, 35@37c.; Fowls, Jersey, choice, per lb., 14@15c.; State and western, prime, 13@14c.; fair to good, 11@12c.; Phila. dry-picked, 14@16c.; Capons, large and choice, 30c; small, 24@26c; Ships, per lb., 22@25c.

Supply of game limited. Market firm for choice birds. Wog Snipe, doz., $2 25@2 50; Plover, $1 75@2; Dowitch, $1 50; sand, 50c.; brited pigeons, $2; flight, best, $1 50@1 75; Mo. flight, 90c.@$1; tame squab, $3.

TOBACCO.—There has been no improvement in trade this week; but some looking around by shippers at the close leads to an expectation that something important will be done. Prices are unchanged.

PROVISIONS.—Have tended a little higher on more active dealings. Mess pork closed at for old mess on the spot at $9@9.12½ for ordinary, and new mess at $10 10@10.25; May, $10 June, $10.05; July at $10 10, and August at $10.15. Bacon at $5 for long clear and $5.05 for short clear. Lard—Western steam, at $6.35 for spot, May and June; $6.40 for July, and $6.45 for August. Stearine at 6¾@6¾c. for Western and 7c. for city. Tallow at 6 3-16@6¼c for prime. Beef hams at $17.50. Beef—Extra India mess, $20@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

VEGETABLES.—Fine old potatoes are firm. Common sorts are lower, as there has been an enlargement of stock from other points. New held good prices. Well ripened Florida tomatoes bring $4@5 per crate. Some items of tender southern produce have had hot weather on both ends of the trip and quality has been against sales. Asparagus has been a cheap feature. Bermuda, new, choice, per bbl., $6@6.50; Charleston and Savannah, new, choice, $5 50@6; Florida, new, choice, $5.@5 50; culls, $2.@3; early rose, N. S. and East., per d-h bbl., $3.00@3 75; State, choice, $3.00@3.25; poor to fair, per bbl., $2.25@2.75; Western, per d-h bbl., $2.75@3.00; bulk, per 180 lbs., $2.25@2 87; peachblow, choice, per d-h bbl., $3.12@3.37; bulk, per 180 lbs., $2.75@3.25; inferior, per bbl., $2.25@2 75; State, $3.00@3.37; Prolific, choice, per d-h bbl., $2 75@3 25; peerless, State, $2.75@2 87; do., in bulk, per 180 lbs., $2.40; Jackson white, per d-h bbl., $2 62@2.75; sweet potatoes, Del., per bbl., $4.00; cucumbers, Fla., per crate, 75c.@$1.25; green peas, Maryland, per bbl., $3 00@3 50; Norfolk, per ½ bbl. box, 50@75c.; asparagus, Oyster Bay, per doz., $1.50; Shrewsbury, $1@1.25; South N. J., Md. and Del., 50c.@$1.00; tomatoes, Bermuda, per box 50@60c.; radishes, near-by, per 100 bunches, 30@75c.; cabbages, Norfolk per bbl., 75c.@$1.50; beets, Norfolk, new, per 100 bunches, $1.00@3 00 rhubarb, per 100 bunches, 50c.2.00; onions, Bermuda, per crate, $1.25; squash, Fla., new, per crate, 50@75c.; turnips, Russia, per bbl., $1.15; carrots, per bbl., $1.75.

WOOL.—The desirable lots from the old stock have been pretty well cleared up and the new clips go off well. Manufacturers are free buyers. Prices generally are strong.

Sales at 34@35c. X and XX Ohio; Michigan at 33@34c.; State fleeces at 31@32c.; spring Texas at 17½c.; spring California at 14@20c.

LIVE STOCK MARKETS

NEW YORK, Saturday, May 24th.

BEEVES.—Receipts for the week, 11,061 head; do., last week, 10,290 do. The offerings were again in excess of the demand, and though something better than Wednesday's prices were obtained in early instances, there was a dragging weak feeling at the close. Common native cattle sold at 8c. to dress 55 lbs; best grades to dress 57 lbs., 10c. Ten carloads of Cherokees, 900 lbs. average, brought 8¼c, dress 56 lbs. Mixed Colorado and Cherokee cattle sold at 8¼@9c. to dress 55@58 lbs. Exports for the week comprise 3,500 quarters of beef and 464 live cattle. Reports from England are still adverse to large shipments of live stock.

COWS AND CALVES.—Ordinary milkers range $30@50; a better grade depends upon a chance customer. Parties wanting fine stock deal directly with first-class dairymen or breeders, and there is consequently not much success in peddling a fine animal through the down town streets to meet a merchant customer.

VEAL CALVES—Have been plenty and easy rates have ruled. At the close the feeling is a little better but 5½c is the top for N. J. and 4¾c. for State; poor to good stock, 3@4½c. Buttermilk, 2½@3½c.

SHEEP AND LAMBS.—Receipts for week, 23,966 head; do. last week, 31,543 do. Lambs are active at 6¾@8c. for Southern and Western, and 8¼@9¼c. for N. J. Sheep prime; clipped, 3¾@5¾c.; unshorn, 3¾c.

HOGS.—Receipts for week, 31,751 head: do. last week, 28,303 do. No late sales to establish a rate for live. City dressed western, 4¾@5¾c.

State dressed pork, 5@6c.

Reading for the Young.

WHAT SHALL THE YOUNG FARMER STUDY?

REV. A. W. MANGUM

This question has been propounded by a subscriber of the RURAL. To answer it satisfactorily is difficult, if not impossible, as so much depends on the peculiarities of each case—on the extent of one's education and what he has already acquired. Still, some general directions may be given, which may prove of value.

First, for immediate use and current advantage, it is important to take several first-class periodicals: one on industrial interests (as THE RURAL NEW-YORKER); one giving that part of the history of the day, on reputable and useful subjects, worthy of being published and read; and a religious journal of the church with which one is most nearly connected. The cheapest literature in the world is, perhaps, a well-edited newspaper. If the papers are filed, the young reader should note number, page, etc., of every article that appears of special value or interest, so that he may refer to it at once. A bound volume of a paper like the RURAL, with its well-arranged table of contents, is a rich, miscellaneous library, in itself. If the papers are not kept on file or bound, the pieces that are prized should be cut out, at once, and pasted in a scrap-book; the index being made as the articles are put in. A respectable scrap-book can be made of any old statistical work such as most families may have received from some of the departments at Washington. When such is used, at least every second leaf should be cut out, so that the book will be properly shaped when closed. But, for several reasons, the newspaper is not sufficient. Its articles are too short to give full connected instruction on any subject. It contains such great variety that the reader is not so apt to carefully digest and appropriate any part. Hence, the young man should seek *books* on the special subjects in which he is most interested. These, as to various kinds of industrial work, may be obtained through the publishers of leading agricultural journals, or through a trustworthy bookseller. Some time ago the RURAL NEW-YORKER contained a list of valuable works on various practical subjects. Be sure to get a good work on Political Economy, Wayland's or Walker's is very good. As to general information, beyond one's particular work, the field is broad—boundless. A general history ought to be read, in chronological arrangement. Some universal history, like Tytler's is suitable. For its size, Freeman's Outlines gives the most valuable sketch of that part of history with which our civilization is connected. Some good history of the United States and (if there be one) of one's own State, should be studied. Beyond this, special histories can be read according to taste, means, and opportunity. At least a brief work on ecclesiastical history is important. In general literature, it is easier to tell what not to read. Shun all trashy story-papers, dime novels, sensational works of fiction of large size. Much novel reading wastes time, corrupts the tastes, makes one superficial, destroys the relish for more valuable works, demoralizes the character, and often leads to still more serious evils. Read books that will pay for the reading.

A hand-book on English and American Literature will give much knowledge of authors and their works. Chambers' Cyclopædia of English Literature can now be obtained for a small sum. For its size, I know no book on American literature that will suit a young farmer better than Hart's larger edition. Various departments of Science are now popularized so as to be entertaining and profitable to the common reader.

A periodical like the Eclectic Magazine will keep one, in some degree, advised of the progress and tendency of modern thought.

Every one who can afford to buy it, ought to get Appleton's American Cyclopædia, or some similar work. The comprehensiveness, variety, trustworthiness, and convenience of a set of such volumes render them of incalculable value. Those who cannot get the new edition (and the many cannot) will do well to purchase even a second-hand copy of the older editions. Either Appleton's, Johnson's, or Chambers's may be esteemed a treasure in this age when knowledge is so vast and time so precious.

Any minister or other religious friend of educational attainments can give directions as to a course of reading in religious literature.

Last of all, yet most emphatically of all, I commend to the young farmer the study of the greatest of all books. I need not name it, in other words. It teaches every one how to be best and to do best for himself and others. The wonderful Book of Proverbs is at least one of the best treatises on private and political economy that has ever been written. The whole Bible ought to be studied in youth, while the character is forming, in riper years, while duty makes its ceaseless demands. It teaches the direct way to godliness; and "godliness is profitable unto all things, having the promise of the life that now is and of that which is to come."

CHILDRENS' GARDENS.

ANNIE L. JACK.

THE timely remarks of RURAL Editor, regarding the new Horticultural Club, have interested me very much, all the more I suppose because it is one of our little home peculiarities that I should be glad to see adopted in other families. In the interest of the club, with Uncle Mark's permission, I will tell you what for the last eighteen years has been our plan: When our babies are too young to know what it means, their tree loving papa has planted for each a fruit tree—cherry, apple, or pear, and the spot around it is called the garden of the baby to whom the tree belongs. It is a treasured spot in their eyes, and at the age of *two*, I have seen the little ones out with a few peas, or seed of morning glory, or anything else that was at hand to plant in "mine gardy." As they grow older, this becomes a sort of experimental ground, cuttings are planted, roses set out and each strives to outvie the other. It was my own custom in autumn to plant a bulb or two, hyacinth, crocus or snowdrops, without any remark, and the wondering eyes that have met mine when the first spring days came, are still in memory, while the little one would whisper or shout, according to the several disposition, "There's something coming up in my garden already." Older sisters and brothers coming home from the woods with treasures, share them with baby in the latest garden, and there you are sure to find the earliest hepatica and violets. The children have learned the names of flowers in this way, and highly amuse my visitors by asking them to go and see their portulacca, or some other name equally long. The trees thrive and grow with the digging around and care the flowers receive, and some of the elder children now harvest a barrel of choice apples, which is sold, and the money of course becomes their own pocket property. It is an important point in this matter for parents to respect the garden of each child as they would that of a neighbor—not to appropriate a single plant or fruit with the careless remark, "Oh! Joe has some fine melons, let us taste them," this will be quite enough to discourage the little gardener, who would be proud to make mamma a present of the same. When my little girls have sown their seed too thickly and have a surplus of anything I can use, I make a point of buying or exchanging with them, this is encouragement and an assertion of their individuality. Yes, plant flowers, fruit, vegetables or anything you fancy, children, and learn their nature and habits, as they grow, for does not your own beloved Whittier say:

"Who sows a field, or trains a flower,
Or plants a tree, is more than all."

FROM A PARENT.

DEAR UNCLE MARK:—The little ones are very anxious to join the Club. Each one has selected some flowers and vegetables to nurse. I will get them to take notes and put them in shape for you. Some have selected wild flowers, the names of which they wish to know; can you help them to names? I will write again when the grass-killing fever subsides. I inclose the list of names; only six. Truly yours,

Caldwell, Texas. D. H. H.

[I shall be glad to assist the members in naming their plants. Send the plants, or, if these are too large, some flowers and a branch with leaves of each. In sending specimens so long a distance there is danger that they may be crushed, or dry out and spoil, unless well done up. Pack fresh specimens in damp moss in a tin can or a light wooden box; paste-board boxes are often crushed in the transit, and if their contents are damp, may meet with some opposition from the P. O. officials.

UNCLE MARK.]

LETTERS FROM BOYS AND GIRLS.

DEAR UNCLE TRUE:—As the cousins are all writing to Uncle Mark, I thought you might feel slighted, so I will write to you. In a recent paper I noticed a letter from Bertie Park, in which he told how many onions he raised from half an acre, I would like to tell how many we boys raised from *one-fourth of an acre*. We first manured the ground heavily, and then plowed it, smoothed it, and sowed the seed in rows fourteen inches apart. The weeds came up in due time, but these we kept down with a cultivator made for the purpose. (Bertie's mule would have had to be pretty sober to have walked between those rows). We would then get down on our knees with a knife and cut the weeds from around the roots. This operation had to be repeated four or five times, but we were well repaid, for in the fall we harvested 198 (one hundred and ninety-eight) bushels of onions. Besides these, there was ten or twelve bushels of scullions that were unfit for sale. We received 60 and 65 cents per bushel in the town of La Crosse, 12 miles away. Tell Uncle Mark I would like to join his Horticultural Club, though I have enough farm work to occupy most of my time. Our Swiss cousin has had such delightful experience with a skunk, that I think he had better get the picture of one, standing on a sugar bucket, taken, and hang it around his neck. As you printed my last letter signed Relic Seeker, I feel encouraged to write again. Your nephew,

ROBERT HARRISON.

DEAR UNCLE MARK: I have been longing to join your club for some time, so I thought that I would write a letter to you and to the cousins. I suppose a great many of the boys and girls who belong to the Horticultural Club live in the country; but I do not, I live in New York. We have a nice yard in which are some grape-vines and some roses. Papa is going to set out some flowers of different kinds, and I am to have a bed of flowers all to myself. I am a constant reader of the boys' and girls' letters who belong to the club, and would like to hear how Lizzie Hay's flowers are getting along. Please put my name on your list. Your niece, LIZZIE E. BLAIR.

New York City.

DEAR UNCLE MARK: I have been very much interested in reading the letters in the RURAL NEW-YORKER, from the girls and boys, and have thought many times I would try and write, but did not have courage. Now, as I was reading of the way to make farmers, in the RURAL of May 3d, and of the Youth's Horticultural Club, I will send in my name for a member of your club, if you will accept it. I have been very busy since the warm weather preparing my flower beds and sowing the seeds we received from the RURAL seed distribution and others, and hope to send you a favorable account of the product of my labors in due time. Very truly yours. VIOLET M. V.

Carthage, Jeff. Co., N. Y.

DEAR UNCLE AND COUSINS,—As this is my first letter, I present myself with the wish to be one of the cousins. My father has taken the "Dear RURAL" ever since I was big enough to read it. I have no pets, but I will tell about my quilts. I have pieced two quilts and have commenced another. I have three sisters and one brother, but I am the oldest of them all. We take great pleasure in reading all the letters. I like those from John Schwyu, and hope to hear from him again. The "Beauty of Hebron" potato and the seeds were received to our satisfaction. My letter is getting pretty long. I am afraid it will go into the waste basket. If not I will write again. SUSIE N. S.

Erie Co., N. Y.

DEAR UNCLE MARK:—I have read your letters regularly every week, and I would like to join your Horticultural Club, as I am a great lover of flowers and of gardening. Our garden is about in the middle of the town, and we have not very much land but still enough for a little garden. I generally go out every year into the woods and get a collection of wild flowers and transplant them into the garden and most of them are in bloom now. I am going to work this year and make some rustic flower-stands, hanging-baskets, etc., from which I hope I shall make a little spending money. I like the idea of having hollow logs for flowers, and I think I shall try and get a few.

Georgetown, Ont. FRANK H. STARR.

DEAR UNCLE MARK: I am not quite 14 years old, and I have a pretty large garden to tend this summer, a great deal larger than a hoop. I have planted onions, lettuce, peas, radishes, cabbage, beans, cucumbers, beets, tomatoes and parsnips, they all look thrifty. I am not raising them to sell, as we have market for them at home. I have four brothers, and each of them have two sisters; now, cousins, how many of you can tell how many there are in the family? As this is my first attempt to write, I hope you will not criticise me too much. Please place my name on the list for your Horticultural Club. S. P. SNELL.

The Puzzler.

BEHEAD AND CURTAIL.

1. Behead and curtail a firclock, and find employment.
2. One who makes gloves, and find to regard with affection.
3. A cutting instrument, and find to perceive by the ear.
4. A narrow passage, and find a weapon for a bow.
5. A grasp, and find to tear.
6. The seat of love, and find a spike of corn.
7. Perfume, and find to act.
8. To collect, and find an instrument to row a boat.
9. Gay, and find to wander.
10. A turner's instrument, and find a spy.
11. Pure, and find to strike.
12. Watery, and find a kind of tree.

☞ Answer in two weeks. M. SMITH.

HIDDEN INSECTS.

14. Oh, Lou, see there?
15. How big Nathan has grown.
16. Tell me if lye is made from ashes.
17. I ask a trifle at your hands.
18. What a butt Eryin (our ram) gave him.
19. Must Remus quit on Saturday.
20. How tumid George's hand is.
21. Seta ran Tula's race for her.
22. Do be easy.
23. Last night in bed Bu gave a scream.
24. Was Peter victorious.
25. I bought my license.

☞ Answer in two weeks. O.

Miscellaneous.

HORSFORD'S Bread Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD, Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bolting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

JOHNSON'S NEW METHOD OF HARMONY.

By A. N. JOHNSON. ($1.00,) Just Published.

This new book is so simple and clear in its explanations, that any music teacher or amateur can get an excellent idea of the science, by simply reading it through. At the same time a most thorough course is marked out for those who wish to be composers, including work for many months, without, or still better, with a teacher. *Thousands can now learn that have not hitherto been able to do so.*

THE GOSPEL OF JOY is received with the greatest favor by all who have examined it, and is, in itself, already a great success. Send for it. Use it in Conventions, Sabbath School Gatherings, and "Congresses," Camp, Praise and Prayermeetings. (35 cts.)

GOOD NEWS. By J. M. McINTOSH. (35 cts.)

Senator Matt Carpenter was doing chores for Governor Dillingham, of Vermont, forty-five years age.

Apostle Frank Murphy, new in 'Frisco, has raised his voice against the Chinese. He visited Chinatown soon after his arrival on the coast, and declares the Mongolian quarters a burning shame and disgrace.

The grandfather of Henry James, Jr., the novelist, was a keen-witted Irish immigrant who had eleven children, and provided all of them with a fortune out of his own accumulation of several million dollars, derived in part from the Syracuse salt works.

Mr. Colfax tells the following story of President Lincoln: "On one occasion during the war he was closeted with three generals when General Tom Thumb was announced. Turning from the business of the interview, the President gave instructions for the immediate admission of the dwarf. On the latter's entrance Mr. Lincoln turned his back on the three generals, and after greeting his new visitor, held him in conversation for several minutes, much to the chagrin of the officers. On the dwarf's departure, one of the generals ventured to remark that Tom Thumb was a very small man, whereupon the President replied: 'My generals, judging by results, are considerably smaller.'"

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 23.
WHOLE No. 1532.

NEW YORK, JUNE 7, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

AVERAGE CULTIVATED WHEAT PLANT, (CLAWSON.) See pp. 358 and 359.
Reduced to 7-16 of natural size. Plant selected May 18.

Farm Topics.

NOTES FROM THE RURAL FARM.

What will be the effect of thorough cultivation upon the wheat plant? Will it pay to cultivate it? That is the question our present experiment is intended to, and we doubt not will, solve—at least as to our own farm. The plot is one-eighth of an acre, and was planted October 1st. It was plowed, harrowed and raked, then marked off 12 by 18 inches and three grains planted at the intersections an inch or so apart, two of which (where all lived) were afterwards pulled up. Thus the plants were 12 inches apart in the row and the rows 18 inches apart. It is supposed that the mass of leaves in a broadcasted or drilled wheat field gives protection to the individual plants; that is, that each protects the other. It may be so. As we looked at our little field last fall, just before freezing weather, the belief could not be escaped that few of those spires, so few and far between, could pass the winter in safety, much less make their cultivation necessary in the spring in pursuance of the object of the experiment. But the belief was ill-founded. The plant on our first page, half the natural size, was selected May 18, as of the average size of those of this plot, while that on the opposite page, is an average plant taken from a field sown broadcast. Both are of the same variety, viz. Clawson.

Our selection of a plot for this experiment was unfortunate. When too late to go over the work again, we found that it was infested with Rye-grass which in this remote and neglected part of our farm, had been permitted to obtain complete possession. But should we harvest a fair amount of grain from the plot, the presence of this pest will give additional weight to the desirability of the method. Of course, we should need special implements for seeding and cultivation. But the ingenuity of our implement men would not be long or severely taxed to furnish them as soon as needed.

The appearance of this plot of wheat at this time (May 26,) is peculiar. The ground is so well covered that cultivation from now on would not be advisable. But instead of the upright, spiral appearance of the ordinary wheat field, this looks coarse, bushy, rank and uneven.

Shriveled Wheat Seed.

Our readers may remember that our Defiance (spring) wheat of last season, was so shriveled that it was not worth thrashing.

It was the same with all of the six varieties of spring wheat which we sowed last year. But Defiance was shriveled most, though the straw and blades were heavier than those of any of the other sorts. If an ordinary wheat grain were cut lengthwise into four equal pieces, each one of these would be as large as the average grain of our Defiance. We desired to know if such shriveled seed would germinate at all, and if so, what difference there would be in the size, strength and yield of the plant. To test this, we sowed (broadcast) a quarter-acre. So far as we can judge, it has germinated as well as any other, so that it only remains to be seen how much influence the quantity of albumen of the seed exerts upon the strength and fruiting powers of the future plant.

An Asparagus "Belt."

This part of the country ought to have been the native home of asparagus, for, escaped from cultivation, it grows wild in hedge, field, wood and meadow. Thousands of acres are in asparagus, and twenty-acre fields are not uncommon. As here cultivated, there is no such thing as a preparation of the ground to endure for years. Sandy soils are preferred. The roots are planted ten inches apart and the rows four feet apart. Late in the fall or early in spring a furrow is plowed directly over the plants, and this is filled with farm manure. A furrow between the rows covers this, and the whole is leveled with wood hand-rakes. Thus its cultivation is continued from year to year upon the same field. No doubt even our Western readers know of the celebrated Oyster Bay asparagus, as if that were a distinct variety. We hear little of it now, not because it is less esteemed, but because hundreds of acres are now cultivated in various parts of Long Island, of the best quality, where one acre was cultivated in years past. The asparagus "belt" may be considered as confined to the south portion of the island. This receives the salt vapors from the sea. Some farmers deem it necessary to sow salt, others do not, and both seem to obtain abundant crops.

Weather Prospects.

We are having rains as often as needed. Our wheat, rye and oats were never looking better at this season. Potato beetles, of which we have a great abundance, seem that entertained with each other, just at this time, that they lose their appetites, while the potato vines, with only here and there a piece nibbled out, are growing vigorously. We have 15 different varieties of potatoes planted side by side for comparison. Corn, owing to the moist ground, to fewer cut-worms than usual and to tarred seed, has come up with exceptional regularity, and is now four inches high. Dourra has just appeared above the surface. Pearl Millet has not yet shown itself.

We are to-day sowing "Webb's new Kinver Yellow Globe Mangel" beside "Mammoth Long Red." The first sort is highly prized by those who have tried it; the second makes up in size what it lacks in quality, and never fails to attract notice at the fairs.

THE MOISTURE OF THE SOIL.

D. E. SALMON, D. V. M.

The experiments of the Rural on the above subject, some time ago, certainly produced a most excellent effect—they brought out the opinons of our leading thinkers on agricultural science, and showed what a frail foundation many of these opinions have; and it is to be hoped that they will demonstrate to our farmers the importance of having these foundation principles of their business determined in a definite and satisfactory manner. The idea of such simple observations putting a whole nation of agriculturists at their wits' end to explain them!

It is very surprising to see how many of those who have criticised and tried to explain these experiments have considered them defective, because the moisture condensed from the air was not taken into account. A writer in a contemporary paper lays great stress on this condensation, and attempts to show that it takes place, and for what reason. As his arguments cover the whole subject, I shall confine myself to a consideration of them. He commences by relating an experiment in mulching apple trees with three inches of sawdust; the trees were newly set and suffering from a long drought. In twelve days after mulching all had started into leaf, and on examining the sawdust the lowest inch and the surface of the ground were found almost saturated with water, although when the sawdust was applied, both it and the surface of the ground were very dry, and there had been no rain in the meantime.

No farmer who uses his eyes will doubt the accuracy of this observation; but let us examine the writer's explanation. The thought occurred to him that the temperature might assist in solving the question. On trial, the earth under the sawdust was found from 7 to 10 deg. cooler than the atmosphere, from which he concludes the water was the result of condensation of atmospheric moisture, since we know that a pitcher of ice-water set in the sun on a warm day will soon be covered with moisture. To show that it was not drawn up by the capillarity of the soil, he cites the Rural's experiments, which "appear to show that a loose, pulverized surface increases the evaporation, which might be interpreted that the placing of sawdust on the surface would cause the evaporation from the earth below to be more rapid; that is, that the moisture, if any, drawn up by the capillary attraction would be passed off more rapidly on account of the mulch!"

If this is not a *reductio ad absurdum* without the author intending it, it certainly has that appearance. Does this gentleman expect us to believe that evaporation of water is increased by restricting the circulation of the air about, and hindering its access to, the water? If we wish to dry wet hay in the quickest manner, do we pile it together to increase evaporation? or do we spread it thinly in order to give it free exposure to the air? Will water evaporate more rapidly from a pan if covered with a cloth than if freely exposed to the circulating air? And if not, how can it be expected to evaporate more rapidly from the surface of the ground when this is covered with sawdust than when freely exposed? The idea is too absurd for serious consideration.

The writer made some other observations, which I will mention before taking up the question of condensation. He found the well-worked soil of a garden two inches below the surface seven deg. cooler than the border which had not been worked; the latter was three deg. higher than the air, the former four deg. lower. Soil well worked six inches deep, the day after a fresh working, showed a temperature six to eight deg. below that of the atmosphere. I give these points because they are of value, and whatever conclusion we reach in regard to his theories, we will not neglect to give due credit and credence to his observations.

Now, permit me to ask if it is true that there is a *free* circulation of air through sawdust or freshly-worked soil, as several writers have assumed? In his article, the gentleman I have been criticising says: "We leave an air space between two walls to prevent the conduction of cold or heat into the interior of the building, and when the walls cannot be made tight, we fill the space with sawdust or other porous substance, and this prevents the conduction of heat in summer." Very true; but why fill with sawdust if there is a free circulation of air through it? Air is a bad *conductor* of heat, so if we can confine it in a space like the above, we have a non-conducting wall; but if there is a free circulation of air, heat is carried by *convection* and the air-space is no longer of value; consequently, we can see why filling with sawdust has even a better effect than making an air-tight space—*the air is confined between the particles and its circulation is prevented.* The same explanation is sufficient to show why the soil under the sawdust was cooler than the atmosphere, and why the same was true of the soil where the top was loosened by cultivation. If there were a free circulation of air, the soil through which it circulated would soon reach the temperature of the atmosphere; and this would take place the sooner if there were a condensation of aqueous vapor, because heat is given out during this process.

In regard to the condensation of atmospheric moisture, it must be remembered that there is a difference of over 50 deg. between the temperature of the surface of a pitcher containing ice water, and that of the air on a warm, summer day; while between that of the newly-worked soil six inches deep and the air, this difference is reduced to from six to eight deg. It may well be asked if so slight a difference would, under ordinary circumstances, be sufficient to cause a condensation. The water of my spring has a summer temperature of 55 deg., and very often when the air is 20 to 25 deg. warmer, there is no condensation of moisture on the sides of a tin or earthern vessel containing it; and I know that this seldom, if ever, takes place when the difference is no greater than eight deg. Here, in the mountains of North Carolina, we often have very heavy night fogs in summer, caused by the great difference between the atmospheric temperature during the day and at night, and I have often examined newly-worked soil early in the morning succeeding these fogs, to see their effect. The surface of this soil would seem very moist, as though a light rain had fallen, but the moisture scarcely penetrated a half inch, the soil underneath being as dry as powder; the effect on vegetation was certainly very slight as it did not reach the roots and was evaporated by an hour's sun. Connected with my earth closet, I have a room for drying the earth in order to use it a second time; here I often have it piled ten inches to a foot deep, but so far from condensing moisture from the air, which is freely admitted by open windows, it rapidly dries out and remains in the form of dust. I have often looked here for condensation but could never see any signs of it except on the very surface. On the contrary, a similar pile of earth in contact with the soil, though protected from rain, will seldom dry as thoroughly even in the hottest and driest weather. Again, in preserving ashes, I have found that when piled on the earth under cover, they soon become almost saturated with water, while if similarly situated, but put in boxes or barrels and kept from the earth, they remain as dry as when freshly burned; and I have often seen boxes of dry sawdust to which the air had free access but which, nevertheless, remained dry for a long time.

I mention these simple facts, which may be readily confirmed, because they bear directly on the question and are just as decisive as any experiments can be. Who does not know that a layer of dry sawdust or cut straw three or four inches deep on a barn floor, will remain dry for an indefinite time, but if placed directly on the soil, it becomes moist in a few days? The fact is very plain that the moisture comes from the soil and not from the atmosphere; and this is very fortunate, for otherwise the hay and straw which we store in our barns would become saturated with moisture, and rot.

I occasionally put out a great many cabbage and tomato plants, and in doing this follow the advice of our best market gardeners, which is to plow the land just before setting, *and pack the earth around the plants.* Though often done in a dry time, I have seldom lost more than two or three per cent.; and have been surprised on going out in the morning, to see how moist was the packed ground about the plants and how dry it was where loose. My explanation of the success of this plan has been that the packed ground allowed the moisture to rise around the roots, which at first do not reach the unstirred soil. If this moisture is derived from the atmosphere, how can such facts be explained? Why is the compacted soil more moist than that which is loose? Further, it has been shown by recent investigations that it is doubtful if this condensing power of the soil has any significance as a measure of supplying crops with water. (Report of Connecticut Ex. Station, 1877, p. 81).

But do not the Rural's experiments show that moisture is evaporated more readily from a loose, pulverized soil than from a compact one? Undoubtedly; how can any sensible man think otherwise? If we loosen the soil we increase the surface exposed to the air; we assist the circulation of the air through the soil, and of course we favor evaporation. In our stirred soils, we do more than this; we prevent the water rising by capillarity to the surface to be evaporated; we place a mulch of loose, dry earth over the soil holding the roots of our crops, which has the same effect as the sawdust or cut straw on the surface. These experiments show what every farmer ought to know, viz.: that loose soil evaporates the water which it holds more rapidly than compact; but the conditions of the experiment were such that capillarity, as it exists in our soils, had no influence upon the results.

The experiments of farmers all over the world, added to those of such scientists as Nessler, Wagner, Schleh (Rep. Ct. Ex. Station, '77, p. 95,) and Grandeau (Rural for 1878, p. 774), are sufficient to show that, in the vast majority of soils, stirring the surface does not as a mulch, does prevent the water rising through the loose part to be evaporated, does increase the water available for the use of the plant. I see nothing inconsistent with this view in the results of the Rural's experiments.

Horticultural.

STRAWBERRIES.

G. GOFF, JR.

Garden Culture.

Strawberries are becoming more popular every year. The ease with which they are produced, and the great variety of soils and climates to which the plants are adapted, make the fruit a general favorite wherever it is known. In this latitude, strawberries are the first fruit of the season, and ripening as they do at the commencement of hot weather, when the human system craves and needs a refreshing acid, they are highly appreciated by everyone. It would be interesting to know the number of bushels of strawberries that are usually consumed by some of our large cities. The quantity is certainly immense, and the commercial value of the strawberry crop doubtless runs into the millions. But, on the other hand, there are thousands of families both in city and country that seldom indulge in the luxury of a dish of this fine fruit.

Every farmer's garden should contain a strawberry bed. Many are deterred from setting out the plants because they are ignorant of their culture and think the trouble and expense required to produce the fruit are more than it is worth. But this is not the case. It requires only a small outlay of labor and money to start and care for a strawberry bed, and that outlay will be abundantly repaid by supplying the table liberally every day with this delicious fruit during its bearing season. Strawberries are so easily grown that there is no good reason why every person having land suitable for producing good corn or potatoes, should not have an abundance of this fruit.

The best soil that could be named for strawberries, is probably a deep, rich sandy loam; but almost any soil, if properly prepared, may be made to produce a good crop of very fine berries. In starting a strawberry bed, if the soil is not already rich, it should be made so by applying some kind of manure. If the soil is naturally heavy, well rotted barnyard or stable manure should be used, which will make it lighter and more friable. The ground should be plowed or spaded as deep as possible without mixing it with the subsoil, and should be free from weeds.

Spring is generally considered the best time to set the plants, though they may be set with good results in the fall; but when set in the spring, they will bear a full crop the next season; whereas, if set in the fall, but a partial crop may be expected the next summer, and there would be more danger from winter-killing.

For garden culture, the plants should be set in rows two feet apart with plants a foot apart in the rows. Keep the soil mellow and free from weeds by frequently stirring it with a hoe or cultivator. When the runners start, they may be allowed to take root in the rows, but not between them. Thus "matted rows" will be formed, with a space between for a path to stand in while weeding or picking the fruit. Great care should be taken not to allow the grass and weeds to get started among the plants; for if they once get a foothold, it is almost impossible to exterminate them without destroying the bed. Mulching is of great advantage, especially on dry or bakey soils. The strawberry bed should be covered in the fall with straw, leaves or coarse manure, for winter protection. In the spring the plants should be uncovered, the mulching removed, and the soil between the rows and around the plants loosened up with a spade or a cultivator. When the fruit begins to ripen the ground should be mulched, that the fruit may be kept clean.

In selecting strawberry plants to set, varieties should be chosen that are best suited to the soil in which they are to be planted. The Wilson is noted for its reliability; it will succeed where almost any variety will, but there are other kinds in cultivation, larger in size and superior in flavor. It is impossible to name the varieties best suited to all soils and localities. A variety may do well on one kind

of soil and in one locality and fail almost entirely in another. The best way is to try a few of the kinds that are the most highly recommended and choose those that succeed the best. It is unwise for any person to condemn a variety as worthless because it refuses to do well on his grounds. The strawberry season may be extended considerably by selecting a number of varieties which ripen at different times, thus making a succession of early, medium and late.

Floricultural.

HOW TO DETERMINE THE SIZE OF THE FLOWER GARDEN AND THE PLANTS TO EMPLOY.

THE kinds of flowers which a person selects for his garden ought to be determined by the time he is willing to devote to them and by his means. There are many kinds, such as Zinnias, Portulacas, Linums, Petunias, Pinks, Phlox, Poppies, etc., that, let the season be wet or dry, will take care of themselves after they are well started. Beds of hardy herbaceous perennials also, such as those noticed in a recent RURAL, require little care when once established. A pleasing display may be secured throughout the season at the cost of merely keeping the plots free from weeds and the borders trim and true to their original shapes. But so-called ribbon or carpet beds exact from the beginning a great deal of time and care and, after all, are better suited to extensive grounds in which it is desired to display the wealth of the owner and the skill of the gardener, than to the quiet surroundings of the average country home. We cannot have too great a variety of choice plants, providing we can supply each with all its needs to keep it in health. But a bed of thrifty Petunias is more creditable to the owner than one of sickly exotics, though of the rarest specimens known. We say therefore that there is neither gain nor glory in a neglected bed of flowers or in any garden that shows plainly that the gardening enthusiasm awakened by the inspiriting air of spring, has been dissipated by the enervating heat of summer. A flower garden is a luxury, costly in proportion to its extent and to the class of flowers employed therein. Let us determine its extent by our means, our spare time and by our floricultural enthusiasm.

DESIRABLE WILD PLANTS OF TEXAS.

IT might be said about plants, as the saying went about prophets, they are the least esteemed in their own country. This just calls to my mind a few fine indigenous plants, well worthy of a place between their more coveted exotic brethren. There is, for instance, what is here known as the Mountain Laurel (Sophora speciosa), an evergreen, highly ornamental, hardy shrub, with whitish-yellow or blue racemes of highly fragrant flowers. It abounds in the hilly portions of western Texas, whence it ranges even down to Matagorda Bay. Although a fine and ornamental plant, it is very seldom met with in plant collections and shrubberies. When old, it is rather difficult to transplant. This might in some measure account for its scarcity in ornamental grounds. Its seed, a bright-crimson bean, will, when planted, lie dormant in the ground for months, but, soaked in hot water for a few days, it sprouts almost immediately.

Another fine wild plant of the bulbous class is the Bayou Lily (Crinum Americanum). I have seen this plant grown in hot-houses in Europe and the greatest care bestowed upon it. The large, pure white flowers, with their wavy long petals, or rather divisions of the perianth, are arranged round the scape by fours; they exhale a powerful perfume. They do well in any rich soil, provided the bulbs are planted very deep. Not unfrequently I found the base of them twelve inches below the surface in their natural habitat.

There is a pretty Bignonia growing in some places adjacent to the coast; it differs from the well-known Trumpet-flower (B. radicans) by its flowers being of a clear yellow, spotted with brown. If a different species, or only a variety of the last-mentioned plant, I leave for botanists to decide. (B. cupreolata?). There are many other fine wild plants in Texas, that, planted among the rarer exotics, need not take a back rank. But generally they are not appreciated for no other reason except that they are growing wild.

But it is not in the South alone that beauteous wild flowers, common in woods and pastures, are neglected on account of their frequency, for all over the country there are floricultural beauties disregarded, despite their fine appearance and odor, merely because they are so common and easily obtained, that few at home appreciate their real worth. For a just perception of the merits of these every-day flowers, one has to go where they are rare; for the value of all things—of the diamond as well as of the flowers which find the choicest place in lawn or greenhouse—depends not on intrinsic worth alone, but also on their rarity.

Arboricultural.

THE CALIFORNIA BLACK-WALNUT.

I HAVE seen few trees which, for ornamental purposes, are more worthy of culture than the California Black-Walnut, Juglans nigra Californica. Trees of this kind were found growing only in one locality in the foot-hills of the Sierra Nevada, but from there they have been introduced into nearly all sections of the State. The tree is a slow grower, and has to be from eight to ten years old before producing fruit, but after it has once borne fruit, it will never fail to set a yearly crop. The tree grows from twenty to forty feet high, is strong, hardy, and well branched. The foliage is of a rich, dark green, and quite different from that of the English or Eastern Walnut; it is unequally pinnate, compound, from ten to fourteen inches long, the leaflets, of which there are fifteen to thirty-five on a leaf, are lanceolate in shape, about three-quarters to one inch across at their broadest portion and from two to three and a half inches in length; the foliage is very densely set on the tree, much more so than in the English Walnut.

The nut is from three-quarters to one and a quarter inch in diameter, being inclosed in a thick husk, which dries on the nut and has to be removed with the aid of a knife or other instrument. The shell is rather hard, requiring the use of a hammer to break it. The meat of the nut is rich and pleasant to the taste, and is not only relished by children, but the "old folks" too, go after it. The tree is much hardier than the English Walnut, growing and producing fruit in sections where the latter will not even grow. As a shade tree, it is much handsomer than the other Walnut varieties and far ahead of Locust, Willow, or such trees. The tree holds its foliage until after frost, and, unlike other trees throughout the summer, the ground under it is always clean, never littered with leaves or other refuse. The nuts should be planted as soon as ripe, without removing the husk, when they will germinate in from five to eight months. The first two seasons in very cold climates, I would advise a slight protection in winter. The nuts are ripe in September and October. In our grounds we have six bearing trees, which are the admiration of all who see them. When known in the East this tree cannot be otherwise than popular.

THE CODLING-MOTH.

SOME one says: "All that is wise has been thought already; we must try, however, to think it again."

So much has been written upon agricultural matters, that one may well hesitate before advancing one's own opinions, lest he write upon an already exhausted subject. The question: "How shall we exterminate the Codling-moth?" is not a new one certainly, and yet, I desire to offer a few observations upon it. We are advised to keep swine or sheep in our orchards, or to pick up and destroy all wormy fruit. This is a partial remedy, but is insufficient of itself. More than fifty per cent. of the worms escape from the apples before the fruit drops. How shall we capture the fugitives? Bands about the trees are generally recommended.

By this plan we capture a large number of worms, but the majority fail to enter our trap. Burning lights in the orchard is sometimes advocated, but this is not advisable. For several years I have observed that the Codling-moth was very partial to particular varieties of Apples, as the Swaar, Gilliflower, Rhode Island Greening, etc. For some time I gave the pests credit for being able to select varieties suiting their tastes—as the robin will select the Delaware from less finely-flavored grapes—but this spring, while scraping my trees, I discovered that the varieties most inclined to be wormy, were those that had the roughest bark, and which, of course, furnished the most convenient hiding places, and upon which they could spin their peculiar cocoons with most safety. Many fruit-growers suppose that the worms, after leaving the apples, enter the ground, and there change into moths, but that they do this is, to say the least, doubtful. There is plenty of evidence that they hide under the loose bark and moss of the trees.

In scraping off this rough bark, I have found hundreds of their cocoons. Trees with a smooth bark, like the Red Astrachan, Pound-Sweet, Sweet Winesap, etc., have very few wormy apples.

My plan—as at present advised—is to scrape off all loose bark—there is no moss in my orchard—from the trunks and large branches, and then wash with whale-oil soap—one pound of soap dissolved in about three gallons of water, and applied with a stiff brush. As soon as the blossom buds start, apply the "bands," so often recommended, of course to be followed by the destruction of all wormy fruit. If the above plans fail—especially the first—then I confess my inability to manage the Codling-moth.

NELSON RITTER.

The Apiarian.

OUR BEE HINTS.

Artificial Swarming.

THE month of June is a very busy one for the bee-keeper as well as for the bees. The rich stores of nectar found in the white clover stimulate the breeding, the hives become crowded, and unless artificially divided, the bees will follow their natural instinct and swarm freely during the next few weeks. The apiary may be managed with special regard either to storing as much honey as possible, or to a large increase in colonies; but the young bee-keeper will perhaps attain the best success if he does not throw his whole energy into either one of these directions, but rather be content with a moderate increase of colonies, and get what surplus honey he can without resorting to special management. Artificial swarming consists in removing part of the bees of a colony to another hive and supplying them with a queen, thus making two colonies out of one, or three out of two, according to their strength. This is the method now resorted to by nearly all practical bee-keepers, and it has the advantages over natural swarming that no swarms abscond, and the breeding, which should never suffer interruption at this season, may be continued with but little loss of time.

When a colony becomes very populous and exhibits symptoms of swarming, it is time that it should be divided. In the middle of the day, while the bees are busy gathering, blow a little smoke into the hive, then look it through to find the queen, and, when found, either cage her for the time or set the comb on which she is in a secure place. This point is of importance. By removing frames from one hive to another, without seeing the queen, one runs a great risk of losing her. It is not enough to look over each frame as it is removed. If a large number of bees adhere to it, she can easily be overlooked, as we have learned by dear experience. Next, take out as many frames of brood, with adhering bees, as can be spared without making the colony weak, and place them in an empty hive which should be set close to the other. The open space occasioned in the mother colony, should immediately be filled up with empty combs or frames having startings of comb foundation. Destroy or cut out at the same time all queen cells that may be found. In like manner take a few frames from one or two other hives and place in the new hive till it has the requisite number of combs; and, if necessary to obtain a sufficient force, shake into it a few bees besides what may adhere to the frames.

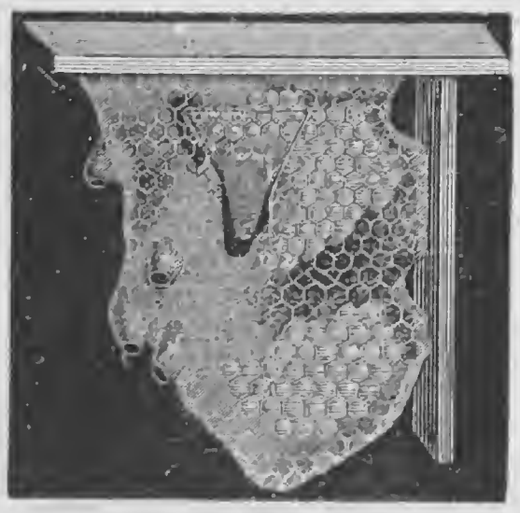
The old queen may be left in her own hive, or she may be removed to the new hive, which will sometimes cure her of her swarming fever, but in either case, a new queen should be introduced to the queenless colony after the lapse of a day or two. During the summer season, the bee-keeper should always have a few extra queens on hand, which may be accomplished as described below; but if he has none, place a frame with a capped queen cell in the middle of the nest, putting those frames having the most brood next to it, and in due time the colony will have a queen. When all is ready, close up all the frames snugly, cut off the vacant space in the hive, if any, with a division board, and the work of dividing is done.

Another mode of artificial swarming is by

The Formation of Nuclei and the Rearing of Queens.

In apiarian language the somewhat technical

term "nucleus" signifies a small number of bees put into a hive with a view to make them the beginners, or first settlers of a new colony, or simply for the purpose of rearing a queen. Practical bee-keepers are at variance as to the best style of hives for nuclei. Some advocate to make small boxes six or eight inches high, wide and long with frames to suit; others prefer small hives, but so adjusted that the frames used in the apiary will fit into them; and still others hold that the common-sized hive is the



QUEEN CELLS.

best, if the space is so contracted by division boards that it will suit the small number of bees. As there should always be some empty hives on hand, and the trouble of making smaller ones, as well of transferring the bees, can thus be avoided, the use of the ordinary hive employed in he apiary is perhaps the best plan. The present busy honey season is the best time for the formation of nuclei and the rearing of queens. Now is the time that queens are wanted; later in the season the demand for them will be limited, besides, those reared in the fall may fail to be fertilized, and if they remain virgins till next spring they will be worthless. A quart of bees and three or four frames containing some brood are sufficient for a nucleus. These may be taken from several hives wherever they can be spared. If there are eggs or larvæ not over three days old, among the brood, the bees will soon construct queen cells around one or more of these, and raise a ruler. But this method is not to be commended when queens are reared on a large scale, though it will do very well when only a few are wanted. In the latter case, to insure that the queens are reared from eggs, which are better for the purpose than young larvæ, and also to get the eggs from a pure and prolific queen, place three or four frames of empty worker-comb in the middle of a hive having a queen worthy to propagate from; these will soon be filled with eggs, when they should be given to the nuclei, one to each, and marked so they can easily be recognized. On each side should be placed a frame having no eggs, and whose larvæ are too old to be transformed into queens, which they are generally acknowledged to be when more than three days old. This precaution will insure that the young queens are hatched from eggs laid by a pure and prolific mother. Under normal conditions an egg in a queen cell will hatch in three days; in five more the cell will be capped, and in about 16 days later her majesty will come forth fully developed, making altogether about twenty-four days.

When queens are reared on a large scale it is desirable to have them develop from the nuclei more rapidly. To this end the colony having the best queen in the apiary is selected from which to breed. Remove the queen to another hive and in three or four days queen cells to the number of fifteen or twenty will be started. Go through the hive carefully every day and as soon as they are capped cut them out with a triangular piece of comb adhering. In another frame having some brood a similar piece of comb should be cut out and a queen cell inserted as represented in the engraving. The cells should be handled with the utmost possible care, as the least indentation of the wall may deform the larva within; and it should not project to either side but hang downwards in the frame, so it cannot be touched by the adjacent comb.

Another necessary requisite to successful queen-rearing is an adequate number of pure drones. These the thoughtful apiarist can easily procure by destroying all drone comb from the beginning of the season, except that appearing in colonies having pure and prolific queens. The queen mates on the wing; and five days after she is hatched, if the weather is pleasant, she will take her wedding trip, otherwise on the first pleasant day thereafter. Having mated, she returns again to her nucleus and in a couple of days will begin to deposit her eggs. It is only when bees from these first eggs appear that one can pronounce with certainty on the purity of a queen. Every bee must have the three distinct yellow bands in order that the mother can be entitled to be called "pure Italian."

If queens thus tested are raised for the market, they are now ready to be sold, and the bees and frames of each nucleus should be returned to some hive as soon as their ruler is sent off. But if the bee-keeper has reared them for his own apiary, they may be used for what is known as

Nucleus Swarming.

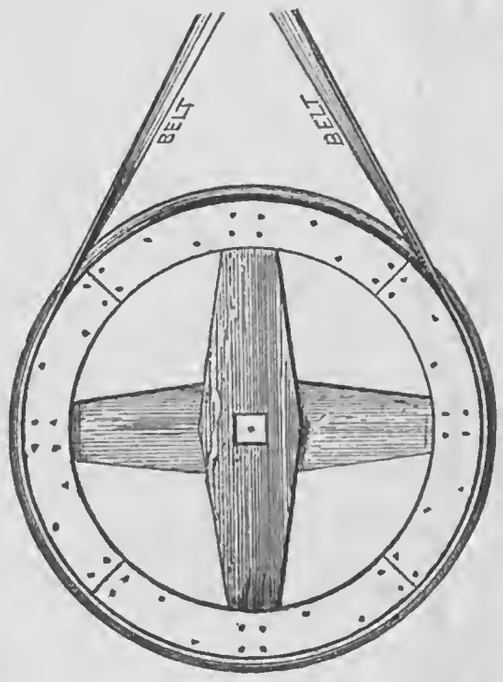
This consists simply in letting the young queens remain in the nucleus and reinforcing them with bees and comb from hives that have become so populous that a division is necessary if they are to be prevented from swarming. This is done as described above, and will be much more rapidly performed when full-sized hives are used for nuclei instead of small boxes. One who raises his own queens and takes all precautions to get them pure, need not wait till they are tested before he increases the nuclei to full colonies. Additions may be made as soon as the queens are fertilized, or even before.

Farm Economy.

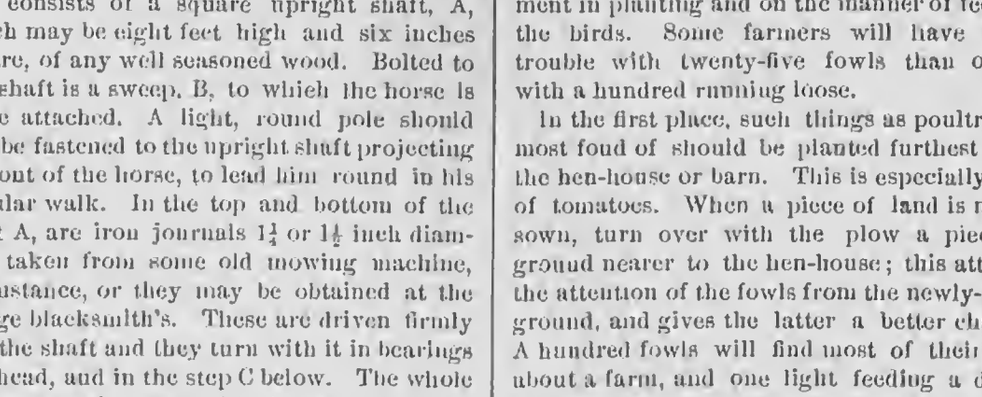
A HOME-MADE HORSE-POWER.

The convenience and value of a simple horse power on the farm are felt by the average farmer far oftener than the convenience itself is enjoyed. With the majority of men the item of first cost is the great obstacle to the possession of such a device. Herewith I present an illustration of what I am confident will be found a valuable home-made power, the cost of which will be but a trifling drawback to its possession.

The sketches show its construction very clearly, and the short description will enable any farmer to erect a good and serviceable machine. One day's work by an intelligent carpenter would, however, be of assistance to some.



It consists of a square upright shaft, A, which may be eight feet high and six inches square, of any well seasoned wood. Bolted to this shaft is a sweep, B, to which the horse is to be attached. A light, round pole should also be fastened to the upright shaft projecting in front of the horse, to lead him round in his circular walk. In the top and bottom of the shaft A, are iron journals 1¼ or 1½ inch diameter, taken from some old mowing machine, for instance, or they may be obtained at the village blacksmith's. These are driven firmly into the shaft and they turn with it in bearings overhead, and in the step C below. The whole arrangement is supposed to be erected in the barn or shed; D, representing a beam, and E the floor. Fastened to the upright shaft is a wooden pulley F, at least six feet above the floor and seven or more feet in diameter. The thickness of this wheel should be four or five inches, with a flange on the bottom one inch thick.



The wheel may be constructed by nailing together segments of plank, the arms also being built as the segments are nailed together. Depending from the beam, D, is a strongly-braced frame G, carrying two loose pulleys H, one only is shown) over which the belt I, passes thence downward to the pulley on the machine to be driven. In this case a corn-sheller is represented. The loose pulleys should be on a level with the center of the driving wheel, and just outside the circle described by the sweep B. It will be seen that gearing is entirely dispensed with, and the motion will be smooth and noiseless. Should a higher motion be wanted than could be got by attaching directly to the machine, an auxilary shaft or "jack" could be easily interposed. For shelling corn, cutting feed, cleaning grain, pumping water, sawing wood, churning and numerous other duties, this simple device will be found an invaluable addition to the farm conveniences.

Ontario Co., N. Y. WILLIAM ROBT. BROOKS.

RAISING TURNIPS.

We are going to cut the clover on a part of a field and then plow under a good coat of manure for a crop of Swedish turnips. We shall sow broadcast over the patch blood guano at the rate of 300 pounds per acre, and put the seed in drills made by hand, with a hoe, an inch deep, and cover the seed with a hoe at this uniform depth. Three-quarters of a pound of seed is enough for an acre. The first week in July is the time set to put in the swedes, but it would do to put in a crop as late as the middle. We have old turnips now on hand hard and good, for table use. This crop will require but one hoeing, and can be utilized to feed pigs, sheep and cattle. The tops are worth a great deal to keep up the flow of milk in the late fall. The ground must be plowed deep and made mellow. We shall soak the seed at least three days before planting, and then roll them in plaster and cover them as fast as dropped. This will make a gain in the time of coming up, and get the turnips just so much ahead of the weeds, which will help in the care of them. The drills will be on a ridge made by turning two shallow furrows together. F. D. C.

The Poultry Yard.

SUMMER FEEDING OF POULTRY ON FARMS.

Poultry will find a great part of their food when at large about the farm during summer. Scarcely anything comes amiss to them. They eat not only all the insects they can find, but they will eat all the cabbage and fruits they can reach, as well as turnip tops when first up, tomatoes and even pumpkins and cucumbers. The question arises, how many hens may a farmer let run without damage to his crops? Few people who have not tried the experiment can believe how much this depends on judgment in planting and on the manner of feeding the birds. Some farmers will have more trouble with twenty-five fowls than others with a hundred running loose.

In the first place, such things as poultry are most fond of should be planted furthest from the hen-house or barn. This is especially true of tomatoes. When a piece of land is newly sown, turn over with the plow a piece of ground nearer to the hen-house; this attracts the attention of the fowls from the newly-sown ground, and gives the latter a better chance. A hundred fowls will find most of their food about a farm, and one light feeding a day is all that many get; but the question comes, how does it pay to let them find nearly all their food? If the house is surrounded with woods or meadows, it will pay to feed fowls lightly; but if the farm is mostly laid out in fruit or market truck, then it will pay to feed your poultry with all the grain they will eat, rather then confine them in a small yard. And if grain is left all the time before them, they will eat but little more than if it were fed regularly to them, while they will so far satisfy their hunger that they will do little injury to the growing crops.

However singular it may appear, their pecking at everything they see is, to a great extent, habit with fowls, a fact I proved by experiment. I had a great many fowls running loose, and they seldom did much mischief to the crops except by scratching, but I always had corn or wheat accessible to them. One day a neighbor remarked that it was not necessary to feed them oftener than once a day, and then only lightly. I thought I would try the experiment, but it was a sad mistake. My hens pecked everything within reach, even unripe melons, pumpkins, cucumbers, turnips, etc. The damage done soon amounted to ten times as much as the cost of feeding them as I had done for years. So I again returned to feeding them all they wanted with grain, leaving it always before them; but the mischief was done—the habit of pecking at everything, once contracted, could not be cured that season. Irregular feed will also produce this effect on fowls; for when they get hungry they will attack the crops, and soon contract the habit.

HENRY HALES.

Miscellaneous.

OUR NEXT FREE SEED DISTRIBUTION.

So far as we can now judge, most of our readers have been greatly pleased with our Seed Distribution of this year.* But some of them have not, and the fault is ours; or rather it is the fault of inexperience in an undertaking which proved greater than we had counted upon. We shall never again offer our subscribers a *choice* of seeds, but send to each our entire list of such varieties as we may select. It was this *choice* of ten varieties out of the twenty, which caused the disappointment expressed by some of our readers who did not receive the varieties which they had selected. We knew when the first announcement was made, that we did not have a sufficient supply of several of the varieties to fill all orders, for which reason it was stated that when any of the kinds of seeds mentioned became exhausted, we should select varieties in their place from our reserve stock. Had it been possible to purchase the seeds of which we fell short, we should have done so. But they could not be purchased of the chief seedsmen either in this country or in Europe. Besides, three of the sorts offered originated in the Rural Grounds, viz., the Bronze Ricinus, Golden Tomato and Voorhis Watermelon.

The announcement of our next Free Seed Distribution will be made as soon as we can settle upon what seeds to offer and secure the necessary amount, and this time—life spared—there shall be no cause for disappointment, while we shall strive to make it even more valuable than our last. Meantime, we hope to hear from all as to their success or failure, etc. From such communications we may be guided as to future selections.

* We do not refer to, or include, the distribution of Blunt's Corn.

Cost per ton			15.00

This material is mainly a refuse magnesian lime, such a lime as is burned from the rock of the quarries in Canaan and elsewhere, in Northern Connecticut. In making a valuation, the lime, magnesia and sulphuric acid are reckoned together at 4-10 cents per pound; because burnt lime containing magnesia, and gypsum containing lime and sulphuric acid, can be got at that rate or for $8 per ton.

S. W. JOHNSON, Director.

THE PEARL MILLET.—I received a package of this last spring, and as there seemed to be some doubt about its ripening its seeds in this latitude, I planted some in a hot-bed in April and transplanted in May or June: I sowed some in a corn field, too, at the time of planting corn. For the latter I waited till the weeds were well up before I could find any millet plants and they were not only few and far between, but very small and sickly; so weeds and plants were rooted up together. The hot-bed plants were specially cared for, but I only got about a foot growth and this spring when the snow went off, the tops were green and looked as though they wished to try it on another year which I shall magnanimously allow them to do. S. B. P.

Muskegon, Mich.

BOOKS RECEIVED.

REPORT OF THE FRUIT GROWERS' ASSOCIATION of the Province of Ontario for the year 1878; to which is appended the Annual Report of the Entomological Society of the Province of Ontario for the same year. The horticultural part of this pamphlet embraces 57 pages of useful and practical information on horticulture. The entomological part, including 61 pages, is also replete with interesting information on that subject.

TRANSACTIONS OF THE MASSACHUSETTS HORTICULTURAL SOCIETY for the year 1878. Part II. This pamphlet, 162 pages, is taken up almost entirely by the names of prize-winners at the different shows, a list of members, etc., all, doubtless, of interest to those whose names are here glorified in print, but not of much benefit to the public. Robert Manning, Sec.

REPORT on Condition of the Crops and Live Stock. April, 1879. Issued by the Department of Agriculture.

PREMIUM LIST of Broome Co., N. Y., Agricultural Society.

CREAM RAISING AND BALLOON RAISING.

I HAVE read the rejoinder of Dr. Hoskins, and there are in it one or two things to which I desire briefly to allude. He says: "Mr. Bliss says there is no such thing as cream rising. He might with equal truth say there was no such thing as balloon rising; the laws involved are the same in both cases. According to Mr. Bliss's idea, a balloon could not rise in still air. It would be necessary to create currents in the air in order to get up the balloon."

The cases are not precisely analogous, but they are so nearly so that it is not worth while to take any exceptions to the comparison. In the free air the currents are not so marked as in a close vessel, but they exist nevertheless, and the balloon cannot be raised without them. A balloon does not rise, never did rise and never will rise—Dr. Hoskins to the contrary notwithstanding—till it is raised by an external force. The law of inertia never was and never will be suspended for his accommodation. As for the still air, in which he assumes that a balloon rises, there never was such a thing in nature. But I will not take time and space to discuss any side issues. A balloon is raised by atmospheric pressure, just as a globule of cream is raised by the pressure of the fluid by which it is surrounded. The atmosphere presses in every direction with equal force at the same level; but this pressure decreases as we rise above or increases as we descend below the assumed level. The bottom of the balloon is in one level and the top of it in a higher level, hence the upward pressure upon the balloon is greater than the downward: and this difference in pressure—which is known as the buoyant effort—is exactly equal to the weight of the air displaced by the balloon. If the balloon has less specific gravity than the air it displaces—which is usually the case when set free—it is forced upward, displacing a portion of the atmosphere above, while the pressure from below is maintained by a constant influx of the surrounding air. If Dr. Hoskins's eminent preceptor has taught him how this can be accomplished without establishing currents, even in still air, he deserves further promotion.

What possible analogy there is between drawing a string of beads up through a vessel of sand and the subject under discussion, I am unable to see. That illustration may have its special use somewhere, but our learned friend has certainly mistaken its application.

O. S. BLISS.

[The following paragraph should have closed Mr. Bliss's article "Specific Heat and Cream Raising," in our last issue, but was omitted by a printer's slip.—EDS.]

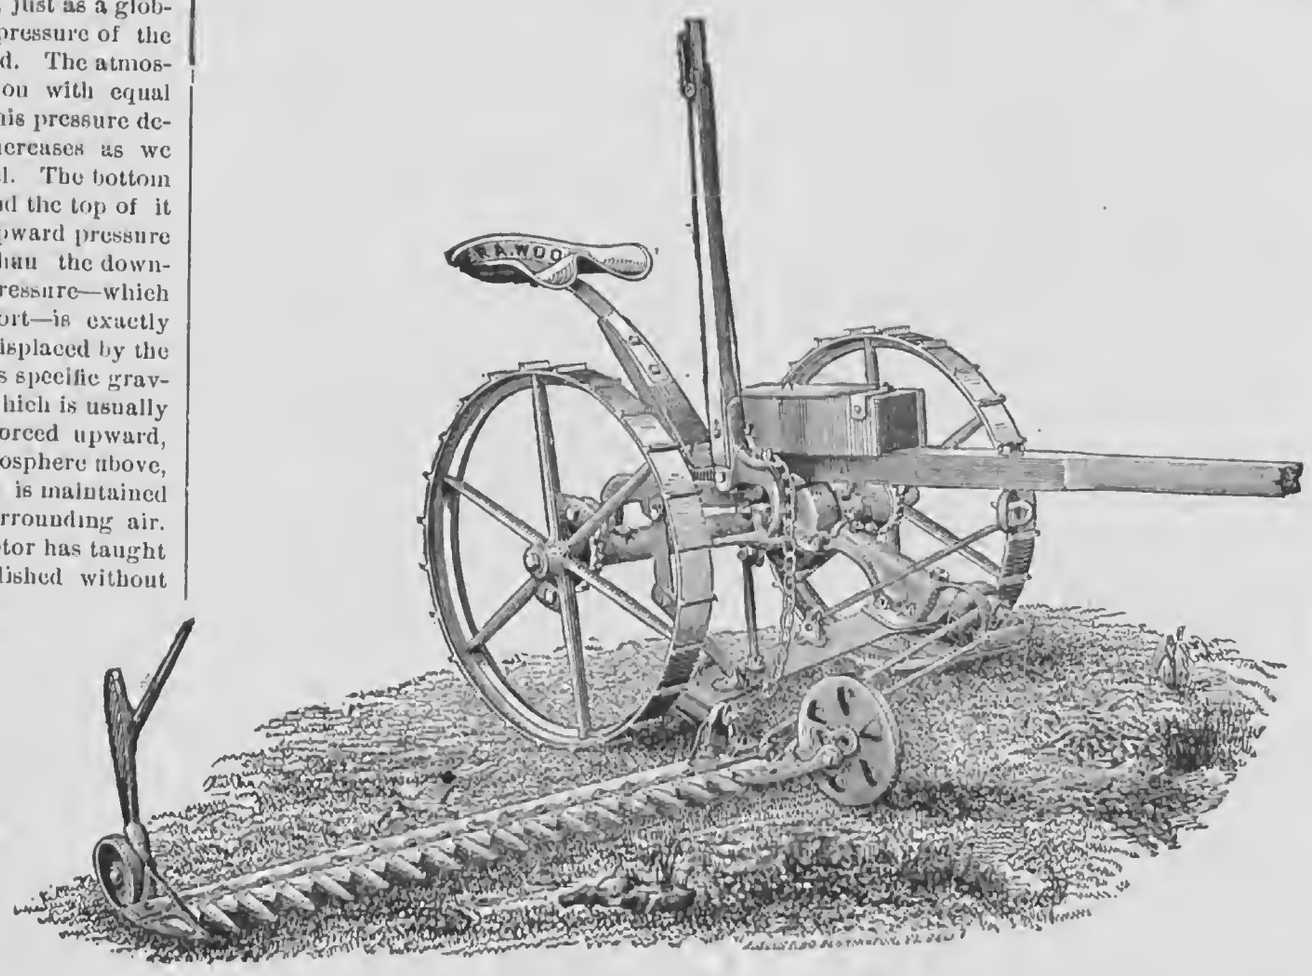
But there are other principles involved and they are infinitely more potent than that of specific heat. Every body has a power of absorption and radiation peculiar to itself and wholly independent of its specific heat. The expansion and contraction of bodies under the influence of heat and cold, though constant so far as each individual body is concerned, are not the same in any two—the element of time and the principle of convection both have an important bearing upon the subject. Now, it is a fact as well established as any other, though evidently not so generally understood, that milk absorbs and radiates heat with greater power and greater rapidity than cream, and the poorer the milk or the richer the cream, the greater the difference. On the other hand, cream expands and contracts more than milk under the same changes of temperature. Now is apparent the value of time and celerity of action, especially when the heat is radiated from the surface of the mass. Tyndall says, no objection need be made to the use of the phrase "conduction of cold," if it be used with a clear knowledge of the physical process involved. The same may be said of the "absorption of cold" and "the convection of cold," and these terms though not strictly correct, may be better understood in this connection. A colder body placed in proximity to the surface of a vessel of milk, at once begins to absorb its heat and the milk in turn absorbs cold from the other. But the milk having greater power of absorption than the cream, and greater specific gravity, at once seizes upon the cold and with the increased energy thus acquired, before the cream is affected at all, under the operation of the law of convection, carries the cold with it to the bottom of the vessel to force up in turn the more passive cream. This interchange of temperature proceeds till an equilibrium is established, greatly facilitating and aiding the separation of the cream. This view of the subject, unlike those alluded to above, is in perfect harmony with the law of specific heat, the law of specific gravity, the law of absorption and radiation of heat, the law of expansion and contraction under variations of temperature and the observation and experience of practical men. It is moreover, the first exposition of the laws which govern cream-raising, which does not leave something to be accounted for—something which, on the face of it, requires a suspension or evasion of well-established principles in physics.

Industrial Implements.

WOOD'S NEW INCLOSED GEAR MOWER.

OF late years the drift of improvement in mowing and reaping machinery has led to an effort to reduce weight and to simplify mechanism. A recent inspection of the new inclosed gear mower, made by the Walter A. Wood Mowing and Reaping Machine Co., of Hoosick Falls, N. Y., developed some important and novel modifications, which are partially shown in the accompanying engraving of the two-horse machine.

The striking advantages of this mower over the popular iron frame heretofore made by the same firm, include greater lightness and better distribution of weight; removal of gearing from the driving wheels to the main axle, where it is compact, and inclosed by perfectly-fitting shields that exclude all injurious matter. The width of tread is increased, the driving wheels are larger in diameter and the draft in consequence made easier. The cutting apparatus has been modified and improved by a new device that more perfectly connects it with the main frame, while the pitman is equally well protected. The draft is direct from the frame of the mower, instead of from the pole, and the greater part of the weight of the machine is on the left hand drive wheel.



WOOD'S NEW INCLOSED GEAR MOWER.

Last season a few thousands were introduced in the Eastern States, and so popular and successful were these trial mowers that it has been decided to supply this mower exclusively the present season. The most frequent objection to a very light mower is made on the score of its inability to stand severe work, but in the Wood machine the decrease in weight has been effected by substituting tougher substances, such as steel, cold rolled and malleable iron, for inferior and more weighty grades of metal. The workmanship is very thorough.

Their Senior and Junior Sweep Rake Reapers have been improved this season by the application of an automatic gear—a train of gears, that absolutely control the successive action of the rakes by means of a lever. The driver, in his seat, can set the machinery so that every alternate rake, or every third, fourth or fifth rake, will act as a rake, while the others will act as beaters.

THE ROBBINS CULTIVATOR.

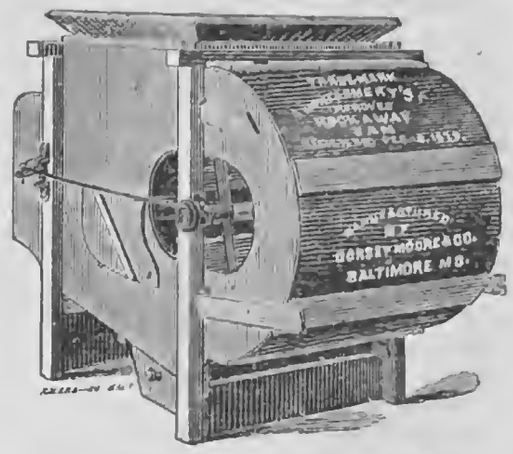
Not many years ago the belief was universal, and is still quite general amongst Eastern farmers that, compared with the sub-soiling, cross plowing, summer fallowing and almost constant cultivation of the growing crop which they found necessary to secure fair returns from their planting, the lot of the Western tiller of the soil was a mere play-day. "Tickle the ground with a harrow and it will laugh with a crop," was believed to be a fair statement of the kind and amount of labor required of him. Against such a competition in crop farming, the Eastern farmer found a paying refuge in stock and the dairy. But a change has been taking place which makes it necessary for Eastern farmers to seek some other means of getting a profit out of their acres. Eastern grass lands, grown cold and sour and less productive through long lack of cultivation, can no longer compete with the boundless ranges of Nebraska, Kansas and Colorado, having easy access, as they now do, to the markets of the world. What direction our farmers propose to give to the new departure rendered necessary by the changed condition of affairs is shown by the greatly increased breadth of land being put under the plow and thoroughly worked by other farm implements. One of these tools—the Robbins cultivator, made by the Robbins Cultivator Co., of Jackson, Mich.—which is now being extensively introduced through the East, especially New York State—is worthy of a careful examination by farmers. The Robbins is a two-horse riding cultivator, but is so arranged that the operator may ride or walk at pleasure. The wheels are four feet four inches in diameter, and the axle-wood, being set some distance above the center of the wheel by means of an angular axle-arm, is enabled to pass over corn at the last working without breaking it down. The cultivator has seven shovels, three of which, with the frame to which they are attached, are removed when cultivating corn and similar crops, leaving two shovels on each side of the row. For breaking up, fall plowing, working fallows and covering grain, all the shovels are used, giving a cultivator of four feet width of cut. The cultivator is furnished, when desired, with a seeding attachment which will sow all kinds of grain broad-cast in front of the shovels—so that it may be sown and covered at the same time—in any desired quantity to the acre.

Nearly 10,000 of these cultivators and a very large number of seeding attachments are now in use in Michigan.

THE ROCKAWAY GRAIN FAN.

THE advantages of a good fan are not only manifested in the improvement of the grain as a marketable commodity, but its intelligent use will save a farmer not only annoyance from weeds, but spare him the necessity of extra cash outlays to fight them. Few consider to what extent they sow, with their insufficiently cleaned grain, the seeds of the weeds they are so prone to anathematize later.

The fan we illustrate first attracted the writer's notice a year ago, and a careful examination of its principles and construction impressed him very favorably. It has been in very general use for years in some parts of the



country, and has not therefore to make a name. It has been put to severe competitive tests and has separated successfully from the grain all weed seeds. The motion is easy, yet rapid, and the screens are susceptible of various combinations and adjustments adapting them to any kind of work. Messrs. Dorsey, Moore & Co., of Baltimore Md., are now the exclusive makers, and to them all applications for circulars and information should be made.

THE "KING OF THE LAWN."

AT no time do we remember having seen so many new lawn mowers offered for sale as this season. In addition to the brand-new ones, some of the established manufacturers have produced modifications of the styles already in vogue. These together with the new machines seem to aim primarily at simplicity and lightness of draft. The "King of the Lawn" mower made by Gregg & Co., of Trumansburg, N. Y., is one of the machines we have been testing at the RURAL Horticultural Grounds. We are greatly pleased with the simplicity of its mechanism, and the extreme ease with which it may be pushed about over the lawn. A little girl can manage it. The 14-inch cut weighs but forty pounds. We should think from the excellence of the material employed in its construction that it would be a most durable mower. It cuts satisfactorily, and, in short, is a very nice and cheap machine.

THE NOYES SYSTEM of Haying Tools made by the U. S. Wind Engine and Pump Co., of Batavia, Ill., are very clearly illustrated and explained by a sheet of engravings that are being sent to all applicants without charge. A vast amount of information is conveyed in regard to tracking and arranging barns, with details for making a field stacking frame. Of their hay carriers both rod and anti-friction there are many thousands in use, the anti-friction being the greatest favorite. The Noyes Grapple fork is two, four, and six-tined for farm use while a monster for use in paper mills has been constructed, capable of taking up a half ton of rye straw at a forkful.

The Company, which is in every respect trustworthy, sends to every inquirer a postal card containing a series of questions which, on being answered, enable it to furnish an estimate of the exact cost of what the farmer may deem necessary in his particular case.

A RECENT visit to Concord, N. H., led to an inspection of the churn factory of Messrs. P. Blanchard's Sons. The most striking things were the celerity with which churns were made, and the labor-saving devices employed to secure uniformity, and cheapness combined with excellence. The novelties were a cylindrical factory churn and a power butter-worker—the only implement of the kind made. It is new, being a recent invention of Mr. Blanchard, and it does its work splendidly. In the future we shall give an extended description of it and its eccentric manner of thoroughly and rapidly working butter.

THE Empire Agricultural Works of Cohleskill, N. Y., seem to understand and appreciate the advantage of printing what they have to say in the most attractive form. The "Fearless" thrashers and horse-powers, made under Mr. Harder's supervision, are highly esteemed by those who have tried them, and they have secured medals and diplomas at the Centennial and elsewhere.

Everywhere.

CALIFORNIA NOTES.

THE rainy season commonly ends with April, when we plant our corn and other spring crops. Up to May 1st the season's rainfall was 29.50 inches, enough to make good crops all over California, except in the desert region along the west side of the San Joaquin, and southwardly. Our hay crop is not timothy and clover, as those grasses do not grow here; but we sow wheat, or a mixture of wheat, barley and oats, put in as if for a crop of grain, and at this time of the year, it is ready to cut. Ours stood about four feet high the day before yesterday, headed out, and the grain in the milk. The boys cut down fifteen acres, and got some of it in cock last evening; but the sun, an hour before setting, gathered dim masses of watery-hued mists, and later went behind a sullen wall of fogs and clouds, resting far out on the Pacific and spreading its black wings out of sight along the horizon. During the night a few drops of rain pattered on the roof. This morning the sky was ridged with slate-colored clouds drifting rapidly inland, and the rain began to pour steadily. The writer thought of his hay, and consoled himself with the knowledge that it takes a good deal of rain to spoil wheat hay. So we go. A rain storm is almost as much of a surprise now as was the adoption of the new constitution.

There will be a fine crop of all sorts of fruit in this valley. Take our place, for example: we have just finished hand-picking and thinning the fruit on peach trees. It is about as large as hulled walnuts. Cool weather thinned out pears, plums, cherries, apples, nectarines, apricots and almonds, but left quite enough fruit and nuts. At some exposed points the vineyards have been touched with frost. However, there will be a large crop of grapes. It is our largest industry, except farming and mining and dairying. This county produced last year nearly 3,000,000 of gallons of wine, or its equivalent in brandy and raisins.

Pastures are magnificent. They spread, knee-deep, from mountain top to mountain top, across the valleys, and are dotted over with cattle and sheep. This is the great natural advantage of California. From October to June the pastures are green. Afterwards, the dried herbage is as nutritious as hay, because no rain falls on it. If pastures are not overstocked, they will produce fat bullocks the year around without other feed. From inquiry among my friends engaged in the sheep business, I learn that the increase during the past season of lambing, may be set down at seventy-five per cent. The favorite sheep ranches are rough, foot-hill lands costing from five to ten dollars an acre. The sheep are shorn twice a year, giving the fleece for expenses and the increase of flock for profit. The business is better, and surer than any other; but it requires a small capital, say from five to ten thousand dollars.

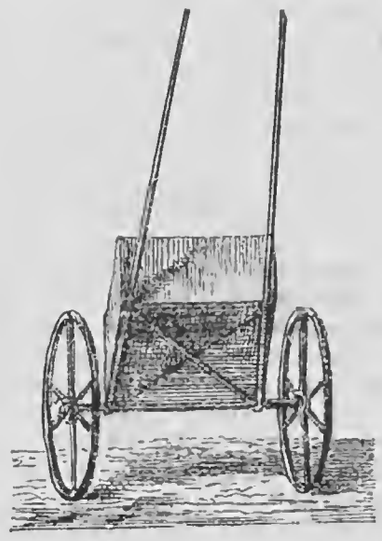
The daily overland trains are crowded with immigrants. They pour in by rail at the rate of over one hundred daily, besides those coming by sea. For a year or two there was a halt. We cannot imagine what started it up again. Permit the writer to address a few honest, plainly-spoken words to those visionary men and women who are coming to California without means to pay their return passage, and without duly considering these matters. In the first place, this coast is overcrowded with certain kinds of labor, and there is much poverty and suffering. A large number of families receive aid from the poor fund, at the expense of a crushing tax on the thrifty. There is no demand for teachers, or for any kind of professional men or women. There are ten times too many folks trying to make a living without labor. There are too many credulous, visionary, "ne'er-do-wells" striking out for this coast. We do not want them. They only come to swell the cry of "hard times." But we do want farmers who have means enough to purchase lands and are willing to work them. There is room for such men, but not for genteel tramps. This coast is the hopper into which are sifted the idle, the vicious, the men of desperate fortunes, from every country in Europe and every State in America. There are thirty thousand Chinese and ten thousand five hundred Irish voters in San Francisco, a little city under 300,000 population. It is alive with communism—a political volcano. Therefore, people unable to hold their ground, have no business here. They must go to the wall. But let it be said there is one honest man here to warn the thoughtless back; though this publication will provoke a howl from land sharks, whose business it is to lure the unfortunate here. SPECS.

Santa Rosa, Cal., May 20.

NOTES FROM NORTH CAROLINA.

THE colt, now two years old, was accustomed to the tethering rope when less than a month old. Last year we had a fenced pasture for her, but now we have her tethered again, and though it is eighteen months since her last experience, she has not forgotten it, especially the trick of giving a quick jerk to throw the ring off the pin. We find it a great convenience to have horses and cattle, too, trained, so that they will not get injured by the rope or chain. A few half-hour lessons when quite young, are usually sufficient to teach a colt or calf to take care of itself. Where, as here in North Carolina, the farm is nearly or quite all in one field, the family cow can be managed in this way much more profitably than by any other—except perhaps by soiling. Two or three ordinary trace chains connected with a ring at one end to put on the pin and large enough to turn around readily, answer a good purpose. To remedy the trouble we had with our colt, bore a hole through the pin near the top, and insert a strong pin long enough to prevent the ring from slipping over. We have found this a good way to keep a bull, being much better for his health than long confinement in the stable. Bulls require exercise, and for their own benefit, they should work in harness, and it would be to the interest of the owners if the animals were trained to do so.

Not a small proportion of the farm work in this State is performed by oxen worked singly. Many of them will not weigh over seven hundred pounds, but they do a vast amount of work in a year. A two-thousand-pound Shorthorn would move a tremendous load. The carts used are very simple affairs—two wheels and an axle to which are attached the shafts, braced to prevent motion sidewise. A short yoke—with the usual bow—is used, to each end of which is attached a ring large enough to receive the ends of the shafts, which are secured by a movable pin in front and either a pin or shoulder back of the ring. The accompanying sketch will show the arrangement.



For plowing we use the common plow gear, the same as for a horse with the collar and harness reversed. We drive with one line or two attached to the horns, a halter, and sometimes to a bit in the mouth. In the case of a bull, the ring in his nose would be the place in which to put the lines. M. B. PRINCE.

RURAL SPECIAL REPORTS.

ALABAMA, Elkmont, Limestone Co., May 24.—I came from northern Indiana to northern Alabama a little over one year ago, and like the country and climate so well that I have entered a quarter section of government land in this county and am going to try and make a home here. Having no money to buy improved land, I took Uncle Sam's offer to homestead. There is much more good government land in this vicinity, but it is being taken up rapidly by Northern farmers. This part of the State is one of the finest sections I ever saw in a timbered country for raising stock and sheep. Times are hard and money scarce among old settlers, and new ones, too. Wheat is $1; corn, 50 to 60 cts.; Irish potatoes, 75 cts. to $1; eggs, 7 cts.; butter, 10 to 15 cts.; cow, $15 to $20; young cattle, $5 to $15; sheep, $1.50 to $2.50 per head. Wheat is now putting on its golden color and will be ready for the harvester in a week or ten days. In some localities the rust is doing great damage to it. Corn and cotton are looking finely, and farmers are busy now working them. W. M.

WISCONSIN, Fort Howard, May 24.—At the last session but one of our State legislature a very stringent dog law was enacted. It provides that the assessor shall list all dogs. Every one who owns or keeps a dog shall be assessed. The Town Clerk shall put in the tax roll a tax of $2 for each male and $3 for each female, and the Treasurer shall collect it the same as any other personal-property tax. A fine of $20 per day is imposed on each and every officer mentioned for each and every day such officer shall refuse to perform the duties required by the act. I told our assessor that he must assess. He was here to-day and says he is sending to me all the folks who growl, as I happen to have been elected Town Clerk. One man whose entire tax last year was $1.13 is on for two dogs, which will make four dollars. If you fail to hear from me for a long time and the "Associated Press" has a dispatch recounting "an assault resulting in death," you may know for what cause I bit the dust. Our spring is rather backward and work drags. VAN.

MICHIGAN, Litchfield, Hillsdale Co., May 27.—Our spring has been cold and dry, although at present the weather is moist, as we have had a good rain; but it is rather cool for the crops. Corn has been about all planted—some cultivated. Wheat looks better, and prospects are more favorable than earlier in spring; some of it is showing signs of heading out. Straw will be short. Oats are looking well with few exceptions. I think I can boast of having the nicest potatoes in this neighborhood; they are about twelve inches high. The old pest "Bug" doesn't fail to put in an appearance, but I do not think much harm will be done, unless the pests are left entirely to their own devices. Onions are receiving more attention this year than any year previous, to my knowledge; one man has set out twelve acres of them, another, two. I think there will be an abundance of fruit, to judge from present prospects. D. K.

KANSAS, Elmo, Republic Co., May 20th.—Farmers hereabouts are expecting over an average crop. Winter and spring grains look very fine; rye is in head. Corn is growing finely; most of the farmers have their corn cultivated. Wheat is worth 75c.; corn, 25c.; oats, 20c.; rye, 33c.; hogs, $2 70 per 100 lbs. This county is well adapted to cattle raising, as it is well watered by the Republican River and its valuable tributaries. The soil is not surpassed in the State. There are also good facilities for shipping, as the U. P. R. R. has extended a branch up here from Concordia. Grain, therefore, always commands a good and ready sale, as we have Kansas City, Chicago and St. Louis for markets. The weather is pleasant and we are having seasonable rains. R. H. H.

PA., Clearfield Co., May 26.—We are having fine growing weather here now, but only a few days ago, we were visited with severe frosts, which nipped off our early corn and potatoes in kitchen garden, and which I have no doubt, have injured the fruit more or less. Wheat is not looking as well as it did a year ago; it has been too dry for it. Corn planting is pretty well through, still there will be some planted up to first of June. Seed potatoes scarce and high; oats, which were plenty last fall at 30c. per bushel, now command 40c. H. F. S.

ILLINOIS, Mazon, Grundy Co., May 26.—In this part of the country, corn is undoubtedly King. But few raise any other crop for market. Some raise a little oats, and others a little rye to sell, but diversified farming is here limited to this narrow range. So far, the weather has been very favorable to the corn crop. The cool, dry days have permitted the farmers to put the ground in fine condition, and now that planting time is upon us, the sun is quite warm while there are rains just enough to force up the corn rapidly. M. S. D.

MICHIGAN, Muskegon, May 26.—This is not an agricultural country, but there is quite an amount of fruit and farm crops raised in the vicinity, more especially tree fruits, grapes and berries. The season is rather late, which is here always favorable. Fruit and farm prospects were never better, and if the codling-moth and the plum curculio are starved out, as we hope, by the failure of these fruits by frost last year, our prospects are good. The potato-beetle, though, never fails to put in an appearance. S. B. P.

MISSOURI, Gallatin, May 23.—We had a fine rain on the 19th, and everything is now growing finely. We have for dinner to-day Early Rose potatoes and Philadelphia early peas; the "Beauty of Hebron" are about the same size as Early Rose—1½ inch through. Voorhis watermelon has its first rough leaf and grows rapidly; Canada Victor tomatoes are in bloom; they are earlier than Acme, but not as good. I raised both last year, and think the Acme the best tomato grown. Blunt's corn is growing well since the rain. S. T. B.

OREGON, Tangent, Linn Co., May 20.—We are very backward with our sowing this spring on account of late rains. Very few of our farmers have yet finished sowing. So much rain at this time of the year is very unusual here. Growing crops look well. Prices of produce are: wheat, 80c; oats, 40c. to 50c; potatoes, from $1 to $1.50 per bushel; eggs, 16; per doz; good butter, 25c. per pound. R. L. S.

PENNSYLVANIA, Emporium, Camden Co., May 27.—On the mornings of the 23d and 24th, and again this morning, we had a heavy white frost. Thermometer, on the 23d, 30°; 24th, 32°; 27th, 34°. Cherries and Peaches are killed; Pears injured; Apples appear all right yet J. D.

NEW YORK, Sharon Center, May 24.—Cold and dry here. Ice and hard frost yesterday morning. S. L.

NEBRASKA, Brownsville, May 24.—Crops, except fruit, are in fine condition with us. R. F.

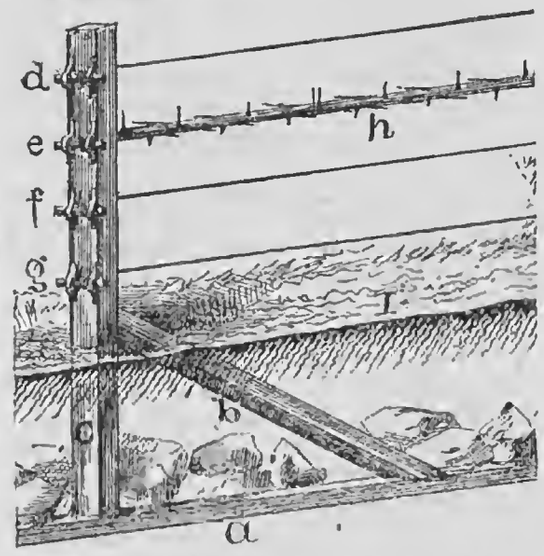
The Querist.

ANSWERS TO CORRESPONDENTS.

Wire Fence, Summer and Winter.

A Subscriber—address mislaid, says he built a wire fence along a lane formerly blocked every winter with snow drifts. He finds it a success as a preventive of drifts, but he had a good deal of trouble in stretching the wires, and probably got them too tight at first in summer time, so that the cold of last winter naturally made them as tight as fiddle-strings; while the warmth of spring and summer has made them so loose that the cows poke their heads through to eat the grass within reach. He finds the patent stretchers furnished with the wire insufficient or unhandy, and asks information or advice.

ANS.—In building the fence, the wires are seized at any required point, several feet from the end post, by a little clamp, and stretched nearly tight enough with an ordinary small rope pulley fastened to the end post. The ends of the wires are then passed through holes in the end post, at proper distances apart, and the final tightening is done by the following little device: It is simply an iron roller or windlass ⅜ inch in diameter, six or eight inches long, of round rod iron, the end hammered square, so that it can be turned with a wrench or crank, and two ⅛-inch holes punched through it, each about an inch from the middle of the roller. The rollers lie horizontally on the *outside* of the end post. The wires are passed through the post and through one hole of each roller. Then the rollers are turned and the wires wound around them till they are of the required tightness, and are held firmly by an iron pin or nail passed through the other hole in the roller, so as to prevent its turning back when the wrench or crank is removed. The device is simple, convenient, and not patented, we think. At least we do not see that it is patentable, as it is simply an application of the roller-windlass in general use, in many forms; as for example, in the rear end of hay racks or straw racks, for tightening the binding rope; in wells, in barns, etc., for butchering purposes, etc., etc.



a, "Mud Sill"; c, post; b, brace; d, e, f and g, rollers for tightening the wires; h, barbed wooden strip; i, dotted line showing the level of the ground. All below that is bedded firmly.

The looseness of the wires mentioned by our friend, may result from the moving of the end posts. They should be very firmly braced. The best way is to mortise and pin firmly a strong post at least six inches square, perpendicularly into a "mud sill," as it is called, and brace it firmly. Then sink the mud sill three feet deep and weight it with heavy stones and dirt, so it cannot lift or move endwise, and the post will never lean or heave with frost, and slacken the wires. The mud sill should be eight or ten feet long, to be firm enough for a long stretch of fence. The cut shows in general the position of sill, post, brace tightening rollers, etc. The wires may be loosened in fall and tightened in spring if necessary.

Worms in a Horse; Currant, Gooseberry and Cabbage Worms, Etc.

D. K., Litchfield, Mich., asks, 1, the cause and remedy for itching tail in a horse; 2, a cure for stretches in sheep; 3, a remedy for currant worms, one for gooseberry worms and another for cabbage worms; 4, is it exhausting to breed a mare every year?

ANS.—Worms are the chief cause of itching about the anus, indicated by a desire to rub the tail against the wall or other object. Apart from bots, there are two kinds of these—the round worm, which dwells in the intestines proper, and the thread worm, which lives almost exclusively in the rectum. The former is from eight to ten inches long, and sometimes much longer, the latter an inch or two. The symptoms of their presence are: a rough coat, irregular appetite and such itching as that here mentioned. If worms are suspected, it is advisable to give a purge and watch the feces for their appearance. As a remedy for round worms, give: Tartar emetic, 1 drachm; powdered ginger, ½ drachm; make into a ball with linseed meal; give one every morning for a week, on an empty stomach, and then follow

with a purge of aloes. Then let the horse rest a week and repeat the above, unless assured of a cure. For thread worms—the more common cause of itching—inject at the rectum every morning for a week, a pint of linseed oil containing two drachms of spirits of turpentine. The itching may also arise from vermin, irritation of the anus, a foul sheath or uncleanliness. As an antidote to these causes, cleanse thoroughly and apply mercurial ointment to destroy the vermin or the eggs of the worms. 2. A full account of stretches in sheep appeared in this Department in our issue of April 5th. It is due to indigestion. A dose of one ounce of linseed oil, repeated the second day, generally relieves the complaint, and its return is prevented by feeding, say for a week, a pint of linseed oil-cake meal daily. 3. The Currant and Gooseberry are so nearly related, that most of the injurious insects that attack one, are common to both. There are about half-a-dozen of these, some of which injure the leaves, and others, the stem. For the former dusting the leaves with powdered white hellebore, as soon as the pest first appears, and repeating the operation daily until it disappears, is an effectual remedy. A dusting with dry, fresh-slaked lime is also recommended. To destroy stem borers, the plants should be closely examined every fall and winter, and every shoot that bears the borer's mark should be cut off and burned. In making cuttings, too, every infested shoot should be destroyed. The cabbage worm proper is the imported Pieris rapæ. For this an experienced horticulturist recommends 20 parts superphosphate of lime, one part carbolic powder and three parts of fresh air-slaked lime; mix thoroughly and throw a small quantity of the compound into each head of cabbage. Repeat three or four times, or oftener, if necessary. 4. It is not an uncommon practice to introduce the male to brood mares a few days subsequent to delivery; but even under the most favorable treatment such frequent pregnancy must be exhausting not only to the mother that has to supply milk to one foal while bearing another, but also to both the young and still unborn offsprings which are thus stinted in needed nourishment. Of course, if the mare is worked hard, or has no extra food to help her along, the evil of the practice is increased.

Hydraulic Rams.

H. W. C., Staunton, Va., wants to convey water about 100 yards from a never-failing spring, and then to raise it vertically about 50 feet up an incline to a tank, for household purposes and for watering stock, and he asks whether a hydraulic ram would be likely to do the work satisfactorily, as there is a considerable fall abruptly from the spring; what are the best length and caliber for the drive pipe; what proportion of the water received from the spring would be raised to the tank at the hight mentioned; what should the caliber of discharge pipe be; and what would be the probable cost of the whole arrangement.

ANS.—That will depend upon the quantity of water discharged from the spring, the amount required at the tank, and the fall that can be used for "driving" purposes. The greater the fall applied, the more effective the motive power, the higher the water can be raised and the greater the proportion that can be delivered at the point desired. It is seldom well, however, to apply a greater fall than ten feet, as the greater the fall the more violent the force with which the ram works and the more speedily the wear and tear of it unfits it for use. With a view to economy of repairs and replacement, therefore, no greater fall should be applied for propelling the ram than is sufficient to raise the requisite supply to the place where it is needed. This may vary from 18 inches to 10, or, occasionally, 15 feet. To calculate the fall that should be applied to raise a given proportion of water to a given hight over an ordinary distance, say 50 or 60 rods, it may safely be estimated that one-seventh part of the water received from the spring, can be raised and discharged at an elevation above the ram ten times as high as the fall applied. Thus, if the ram is placed under a head, or fall, of five feet, of every seven gallons drawn from the spring, one will be raised 50 feet above the ram, or half a gallon, 100 feet; or, with a fall of 10 feet applied to the machine, of every 14 gallons drawn from the well two gallons may be raised 100 feet, one gallon 200 feet, or four gallons 50 feet, and so on proportionately as the fall or rise is increased or diminished. The ram should be placed far enough from the spring to make the drive-pipe, say, 25 to 30 feet long, in order to secure the best results. The best calibers of the drive and discharge pipes depend entirely on the quantity of water furnished per minute by the spring or brook, the quantity to be delivered, and the hight at which it is to be discharged. But little force is needed to counterbalance the *friction* caused by the horizontal passage of water through the pipes. Where only four gallons a minute are delivered, a three-quarter-inch drive pipe is large enough and three-eighth-inch discharge; whereas, for a stream of 25 gallons a minute, the drive pipe should be four inches and the discharge two. The chief part of the cost lies in the price of the pipe, whether wood, lead, wrought-iron or tin-lined lead. The price of ordinary rams varies from $9 to $225 and upwards, the former receiving from the spring four gallons a minute and the latter 250. The next good plumber should be able to give detailed information as to the cost in each case.

Thrush.

W. S. M., Bendersville, Pa., has a five-year-old horse whose frog appears to be affected with thrush, and he asks for a remedy.

ANS.—Thrush is generally due to standing in fermenting filth and foul litter; sometimes it arises from frost-bite, internal disease, irritating applications or "stoppings" to the feet. In it there is a fetid discharge from the cleft of the frog, sometimes accompanied by lameness and a disorganization of the horn. For treatment, place the animal in clean quarters with a dry floor well littered. Thoroughly water, remove all the ragged parts of the frog, cleanse the seat of the disease with soap and Take of calomel one-half ounce, and of sweet oil two ounces; mix, spread on a piece of lint or oakum and insert in the cleft of the frog, and over any other diseased part. The whole should be covered with a layer of wood tar, or a leather shoe may be used for a while with advantage.

Miscellaneous.

S. G., Dwight, Livingston Co., Ill., sends us for name a specimen of grass which grows abundantly on foot-paths and similar places in that section; also a fungus of the Red Cedar, and asks if it will destroy the tree.

ANS.—The grass is Poa annua. It is a very common grass, but not of much value as a fodder plant. It is annual, and keeps flowering all through the summer. It does not resist drought well. The fungus is Podisoma macropus, sometimes called the fruit of the Cedar. It will not destroy the tree, but may interfere somewhat with the growth of the branches to which the balls are attached. If it is desired to rid the tree of it, the best way will be to pick it off.

S. N. A., Freehort, Washington Ter., thinking of engaging in sheep-husbandry in the South, asks of whom he would be likely to obtain correct information about the prospects for that industry in Georgia and Texas.

ANS.—Apply to Dr. T. P. Janes, Com. of Agriculture, Atlanta, Ga., and to T. A. Guthrie, M. A., Agricultural College, Bryan, Brazos Co., Texas.

A. R., Shelby, Ohio, asks whether Pearl Millet is an annual or perennial; at what period of its growth does it produce the best fodder?

ANS.—It is an annual. It may be cut several times according to climate, soil and cultivation. We should suppose it would produce the best fodder if cut rather early, for the reason that the stalks, later in the season, become reed-like and hard.

A. J. B., Clarksfield, Ohio, asks what is meant by the term fodder.

ANS.—It embraces whatever is fed out to cattle, horses and sheep, such as hay, straw, corn-stalks, etc., as well as various vegetables. In common parlance, however, its use is chiefly restricted to long fodder, such as corn-stalks, hay, millet, &c.

R. L. S., Tangent, Oregon, sends a flower for name, known as Curly Lily in that locality.

ANS.—It is Erythronium albidum—White Dog-tooth Violet.

Implements and Machinery.

THE UNION RAILWAY

ORSE POWER.

For One, Two and Three Horses, for driving Threshing Machines, Hay Cutters, Wood-saw Machines, &c., &c. This Power produces much more power than other railway powers, with **much less elevation.** Also manufacturers of **Premium Thresher.** Send for Descriptive Circular. **Wm. L. Boyer & Bro.** 2101 Germantown Av., Philadelphia, Pa.

Mention this paper.

AHEAD OF ALL COMPETITION

1879.

THE PHILADELPHIA

LAWN MOWER.

SEVEN SIZES FOR HAND USE.
Weighing from 32 to 51 lbs.
THREE SIZES FOR HORSE POWER.

The *complete victory* and highest awards at the exhaustive Field Trial at the Paris World's Exhibition in 1878, together with those at the great hundred-day trial at the Centennial in 1876, prove that these machines fully maintain their reputation as the **best** Lawn Mower yet made. Do not buy worthless imitations, when the genuine can be had for the same money.

GRAHAM, EMLEN & PASSMORE, Patantees and Mfrs.
631 Market Street, Philadelphia, Pa.
Send for Descriptive Catalogue with prices.

Implements and Machinery.

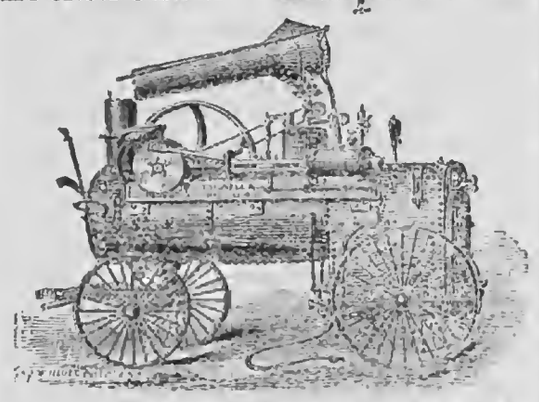
NEW BUCKEYE

LAWN MOWER.

The lightest and easiest-running Mower in the market. It is unequaled for Simplicity, Strength and Durability. Every machine fully warranted. Ask your dealer for it, or send for circular to

MAST, FOOS & CO.,
Springfield, Ohio.

Russell's Improved



FARM ENGINE.

With or Without Traction Attachment.

Easily Managed, does Good Work and More of it than any other Engine.

See What People Say of It:

From Thomas J. and C. L. Nash, Dallas, Tex.—This is to certify that the Ten Horse Portable Engine we purchased of you last September has given entire satisfaction and is all you represented it to be. We are running two Fifty Saw Gin Stands and doing good work. The Engine is economical both in water and fuel, and is easily managed. We most cheerfully recommend it to all parties wanting a first-class engine.

8, 10 & 14 HORSE POWER.

Illustrated Circulars, Price Lists, etc., sent free. Address

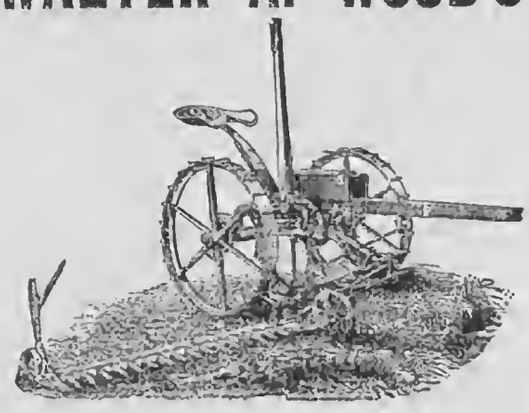
RUSSELL & CO., Massillon, Ohio.

Also manufacturers of the celebrated "New Massillon" and "Massillon" Threshers.

Agents Wanted in New York State.

State you saw this in the Rural New-Yorker.

WALTER A. WOOD'S



New Enclosed Gear Mower.

ONE AND TWO HORSE.

For Simplicity, Lightness, Strength and Durability this Mower cannot be excelled. It is less complicated, easier to repair, and less liable to get out of order than any other machine. Its weight is reduced to a minimum consistent with maintaining the greatest efficiency in handling the most difficult crops.

WALTER A. WOOD'S

New Sweep Rake Reaper.

12 Sizes—5 feet and 5 feet-6 inchest, with and without Mowing Attachment.

with new Automatic device for controlling the rakes. This is the most perfect, lightest draft, and stillest running Reaper made.

Walter A. Wood's Chain Rake Reaper.
" " " Self-Binding Harvester.
" " " Headers.

BIRDSALL ENGINE.

Possesses More Points of Excellence than Any Other now Offered.

IT CERTAINLY STANDS UNRIVALED IN EFFECTIVE POWER, AND THE SAVING OF FUEL AND WATER.

Its saving qualities are super excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times, much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves jobs, saves money, saves reputation, and preserves the good will of all. Trial given in all cases before requiring payment. For special circulars address

E. M. BIRDSALL & CO.,
PENN-YAN, N. Y., or
248 JOHNSON ST., CHICAGO, ILL.

GRAVES' PAT. RUBBER TARGET GUN.

An entirely new principle.
Shoots Arrows or Bullets almost as straight as a RIFLE.
Adapted to all ages.

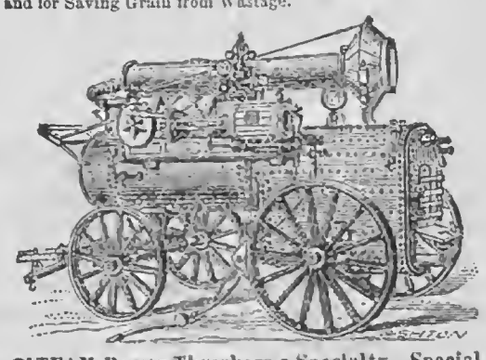
$1.50, delivered, free of cost, throughout the U. S. on receipt of price; or, sent by express, not prepaid, for **$1.00.** Clubs of six supplied with Guns at a low rate.

JOHN WILKINSON, Sole Man'f'r, 77 State St., Chicago.

Send also stamp for my elegant New Catalogue of **Scroll Saws, Lathes, Archery, Base Ball, &c.** I have the best goods in market, and all at manufacturers' prices. I am publisher of Hope's and Ware's Designs, and sole importer of the genuine "Wilkinson Saw Blades."

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

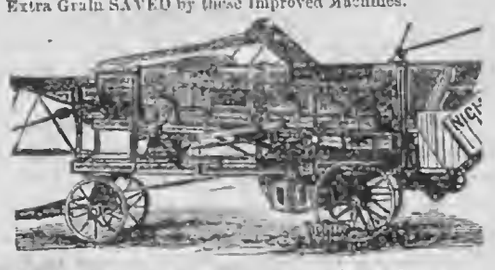
THE Matchless Grain-Saving, Time-Saving, and Money-Saving Threshers of this day and generation. Beyond all rivalry for Rapid Work, Perfect Cleaning, and for Saving Grain from Wastage.



STEAM Power Threshers a Specialty. Special sizes of Separators made expressly for Steam Power.

OUR Unrivaled Steam Thresher Engines, both Portable and Traction, with Valuable Improvements, far beyond any other make or kind.

THE ENTIRE Threshing Expenses (and often three to five times that amount) can be made by the Extra Grain SAVED by these Improved Machines.



GRAIN Raisers will not submit to the enormous wastage of Grain and the inferior work done by all other machines, when once posted on the difference.

NOT Only Vastly Superior for Wheat, Oats, Barley, Rye, and like Grains, but the ONLY Successful Thresher in Flax, Timothy, Millet, Clover, and like Seeds. Requires no "attachments" or "rebuilding" to change from Grain to Seeds.

MARVELOUS for Simplicity of Parts, using less than one-half the usual belts and Gears. Makes Clean Work, with no Litterings or Scatterings.

FOUR Sizes of Separators Made, Ranging from Six to Twelve-Horse size, and two styles of Mounted Horse Powers to match.

IN Thorough Workmanship, Elegant Finish, Perfection of Parts, Completeness of Equipment, etc., our "Vibrator" Thresher Outfits are Incomparable.

FOR Particulars, Call on our Dealers or write to us for Illustrated Circular, which we mail free.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, SUNE 7, 1879.

TO EVERY READER.

We respectfully and urgently call the attention of our readers to the *necessity* which exists that they should address their communications to the Editors or the Publishers of the Rural New-Yorker, if they would insure prompt responses. Letters addressed to individuals are often delayed in this office for weeks. Mr. Moore, to whom letters intended for us are still occasionally addressed, has had no connection with this journal for years.

THE AGRICULTURAL INTEREST.

An old fable relates that the other members of the body once fell foul of the stomach, as an idle vagabond which subsisted uselessly as a parasite on their industry. Finally they "*struck*"—to use a common phrase—and refused longer to support the idler. Alas! the tables were quickly turned and it was found that the wrongly maligned member was the secret, but modest and quiet support of the whole of the family; while, in fact, themselves depended for their living upon the labors of this hitherto despised coworker. This story may be pertinently applied to the agricultural industry; but unfortunately, it does not go far enough. This industry is not only considered as unworthy the notice of the more respectable—so considered—members of society, who are supported by it, but it is actually made a prey and a spoil by these, and it actually remains passive and content under their contumely and oppression. Who ever heard of a threatened strike of the farmers? But what a terrible result would occur from a general refusal of farmers to work. The world, like the human frame, in the fable, would be paralyzed. The wheels of commerce would stop. Mouths would open, but there would be no bread to fill them. The old soakers, even, whose subsistence consists of beer or whiskey, would be forced to come to honest water, and on the whole, there would be a sad state of things in one short week, after the plows were stowed away, and the farmers glowered sullenly but defiantly over their fences at the hordes of those who have been so ready to squeeze them. This is no over-wrought idea. From the moment the farmer prepares to sow his seed, a vast army of parasites, (some may be legitimately so, but the majority are otherwise,) stand eagerly prepared to swoop down upon his harvest.

Let us exhibit a tableau: The scene is in a hall which has a narrow marble entrance in a narrow street in our largest city where bankers and brokers "most do congregate." A stone stairway leads to a gallery protected with a low ballustrade. We look down into a place beneath which, except for want of the poles in the center, might well be a bear garden in a zoological collection.

There is a crowd of men wildly gesticulating, throwing arms about madly, shouting and screaming at the top of their voices; a mad hubbub, in which not a word can be distinguished; a roar as of a vast hurricane through a forest; men dashing down figures upon slips of paper and throwing these at each other as gages of deadly strife, as it were. "Madness rules the hour" in that room, without a doubt. What is the reason? When we come to discover this, we find the "Granger stocks" in Wall street are "booming" upwards. There is an active speculation in them, and prices are advancing with a rush. The cause is said to be the bountiful rain which recently fell all over the Western country and wonderfully helped the wheat crop. You may ask, what had this to do with these leeches which suck the blood of honest industry—the stock speculators? Only this: if there should be a handsome crop, the railroads would get the lion's share for carrying it to market; rates would go up; pools would be formed; money would be raked into the coffers of the railroads and out of the farmers' pockets; dividends would be declared, and so a rise in the values of the stocks would result. This may have been seriously intended, or it may have been a simple trick of the stock gamblers. Either way, the idea existed; the farmers were to be victimized by means of a combination, as they have been thousands of times. So with strikes of all the scores of dissatisfied workers—all struggling to get a larger slice of the farmer's profits, for all these piled-up costs come out of the handling or the use of his crops.

It is an unheard-of thing to see a combination among farmers to protect their own interests. A partial combination a few years ago resulted in a victory for the time being; but, as in a guerilla and unorganized warfare, the victorious army melted away on the very day of the victory, and gathered no fruits from it. The superior organizations of their opponents overcame them, and the unusual combination fell to pieces and is heard of no more except in history. Combined, the farmers could rule the world, because they keep the keys of the provision chest; without organization, they are the prey of every other combination, and fall victims every time without a struggle or resistance. In business, in taxation, in legislation and in social matters they hold the position of the under dog in the fight, because they are not organized so as to use their strength to exact justice for themselves.

WANTED—GOVERNORS AND DIRECTORS.

Look at the machinery of a watch. There is, first, the main spring, or motive power, constantly exerting itself. Its force is communicated to this wheel and the other, and they in turn affect more wheels, until every part of the machinery is affected. But look closely and you will find all of this power controlled and governed by the action of a very small part of the whole machinery. Three or four wheels connected more closely with the hands are really the time-keepers, and these must be just exactly right. The other wheels, or what we may call the motive power, are necessary, to be sure, but they may be coarse or fine in regard to workmanship, with little effect on the watch as a time-keeper. Not so with the governing wheels. To secure accuracy of movement, these must be adjusted and finished with the greatest precision, for they have not only to do their duty as wheels, but they have also to serve as regulators for the others, distributing properly the power they receive from them. A slight defect in one of these wheels ruins the watch, while one of the motive or power wheels might be severely injured—bent, lose a tooth or a cog—and its effect upon the working of the hands be unnoticed.

We use the watch merely as an illustration of what is always going on in the world of labor, where bone and muscle are the motive power and brains the regulators or governors. It has been stated that of the whole population of any State in the Union—and the same will prove true to a greater extent in countries of the Old World—not more than one man in twenty is able to procure, unaided, a good support for himself and family. The majority fail, not because of any want of willingness to work, or bodily strength, but merely because their powers, being undirected, are of little use, and go to waste for want of proper direction.

Nature is kind, and yields bountifully of her productions to those who properly seek them; yet how many are there who, if put in possession of a good farm to-day, would fail to get from it a support! But there are some who not only plan for themselves, but for hundreds of others. The head of a large commercial establishment, by his planning, makes a fortune for himself and at the same time enables hundreds, and perhaps thousands, at home and abroad, to earn a livelihood while aiding him in carrying out his plans.

See Ericson, at thirteen, having direction of six hundred laborers on the Grand Canal, each one of whom was far superior to him in muscular power. But the power needed his young but intelligent brain to give it proper direction, that it might attain desired results. And so, all the world over, the steam engine, the telegraph, all mechanical contrivances are but illustrations that power always requires a governing direction to compel it to subserve man's interest. So with the power of men—the few must be governors of the many, as the few wheels of a watch regulate and control its machinery. The competency of the superintendent often decides if the manufacturing establishment shall be a profit or a loss to its owners. And this is none the less true on a farm. The superintendent, be he owner or employe, who directs the laborers, is the regulator of the whole business. It is well known that one man with the same hands will accomplish a much greater amount of work than another, and that with really less labor, doing it by merely planning where each can work to the best advantage. It may not be out of place to suggest here that one reason why the business of Government is so expensively and unsatisfactorily managed is because sufficient care is not taken to select proper men for the positions they are to fill. Given a set of Congressmen who know their business and are capable of doing it, sessions would be shortened at least by one-half, while the business accomplished would be fourfold.

Directors and Governors are, then, especial needs of the age. Like poets, they are born, not made. The appointment of one to a place of trust does not fit him for it. It is not, except to a limited extent, a matter of education. It must exist in the man and have become his by birthright. The qualities needed are often found where least sought for. The lowly house more often shelters them than does the elegant mansion. Wherever you find a full, high forehead, protruding eyebrows and sharp, keen eyes, a head high and thick, measuring from the opening of the ear, giving firmness, conscientiousness and executiveness large, there you find a man fitted to be your superintendent, and whatever be his rank in life, you may be sure your confidence in him will not be misplaced.

Such men should be sought for. There are many who have never found their proper places among the world's workers, because they do not understand themselves or their abilities, never having been in situations where they could give exercise to the powers they have. But they are wanted in the front rank, and, in justice to themselves and the world, should be placed there.

SPECIALTIES IN EDUCATION.

The tendency of late years has been toward practical as opposed to theoretical education. It is but a few years ago that scientific or practical teaching was discouraged, and our colleges were opposed to giving academic degrees except for a full literary course. The aim was at the Universal instead of the Special, and consequently the knowledge acquired could properly only be a *smattering*. In opposition to the course adopted by colleges and universities, nearly all the great men—those to whom the world is most indebted—became useful and acquired celebrity from a devotion to specialties.

Had Faraday received a general classical education, it is highly doubtful if the world would have known him in the character he worked out for himself. Without scholastic education, but with a great bent toward the natural sciences, he rose to the highest position.

Audubon had a bent toward ornithology, and, without a general education, produced the most remarkable work upon this subject the world had ever seen. His specialty was magnificently executed. Who knows but he might have been diverted from his great task, had he been crammed in the popular way?

Robert Fulton had a bent toward mechanics, and the development of his specialty gave to the world steam navigation, while George Stephenson, owing to a similar bent, gave the world railroads. All the world's great benefactors have been specialists—have educated themselves practically, worked out their theories, embodied the creations of the brain in works of the hand. This age is growing practical, and we trust it may grow more and more so. We trust our agricultural colleges will all become practical schools, and earnestly work out the problems of agriculture that need solution. Let them really make "agriculture and the mechanic arts the *leading object*," as the law requires, instead of attaching these, as some of them do, as the tail to the literary kite. Then we shall turn out specialists in agriculture and mechanics, who will honor their calling and devote their lives to its elevation, instead of those young men who look with contempt upon agriculture and aspire to the honors of the learned professions, which they seldom reach.

SENSATIONAL FARMING.

Some injury is done to the plain, simple-minded folk by the reported statements of enormous agricultural enterprises in California, Minnesota and Dakota, with vast profits growing out of the fabulous operations. One Californian *farms*, or rather skins 45,000 acres yearly by sowing it in wheat. His harvest is said to have produced 900,000 bushels of wheat, netting him $765,000 in one year. One would suppose this man would have realized a moderate competence at least out of his one year's operation; but we now learn that after 10 years' exciting business, he owes about a million dollars and is practically a bankrupt; "land-poor," with a white elephant, which he can neither keep nor let go, on his hands. So in the Northwest, we have had reports of great tracts of land sown to wheat and large sums of money realized. But we are slow to think of the expenses and waste of this sort of agriculture, of the large capital required to produce a crop; of the enormous interest on loans needed to carry on the business and meet current expenses, or on the inevitable final result of ruined land, barren fields, wasted opportunities and a general wreck which alone is left behind of the baseless fabric of a grand vision. It is a great gambling transaction; the weather, season and markets being the largest which are risked, and possible success, barren at the best; a cheap notoriety, or final ruin, are the alternatives. It is well that the facts should be known, and that these glittering stories should be understood, as mere speculative ventures in which there is but one ending, and that a grand crash, a mountain of debt toppling over and crushing the whole fabric; speculators, farms; crops; armies of laborers; troops of horses; parks of machinery; all these involved in one general ruin. This has been, will be, and must be, the end of this illegitimate use of the bountiful soil which is made to pour out its life in a few short years of wasteful, riotous agriculture.

BREVITIES.

The first brood of potato beetles is not yet hatched.

We are in receipt of a box of latest-keeping apples of the season, from Ellwanger & Barry. We are having specimens of each engraved.

Mr. John Saul, of Washington, D. C., sends us a large box of plants, many of which are both new and rare. We will report in due season.

We are surprised that so many of our subscribers should compete for the corn premiums. We wish that all might be entitled to them.

A friend to whom we had given Blunt's Corn, remarked to us that "it came up the soonest and grew the fastest of any corn he had ever planted."

Dr. Salmon's, in our humble judgment, comes nearer to a just estimate of the Rural soil experiments, than any other of the many criticisms that have appeared upon it.

A few days ago we presented to our fowls a nest of Tent Caterpillars. As many as forty examined them in a cautious manner at the distance of a foot or more, and then withdrew.

While birds sometimes destroy weed seeds, it must be also borne in mind that they often disseminate them. Observation and experiments amply prove that many, if not most, of the seeds excreted by the feathered tribes, still retain vitality enough to germinate.

Pearl Millet is just appearing above the ground—a single, slender spear of grass. It is hard to keep the ground free of weeds, so that the rows may be determined. Most of our friends, we find, plant it too early. Now (June 2) is plenty early enough for this climate. If planted earlier, either the weeds smother the little plants or the seeds rot in the ground.

State Fairs.—The New York State Fair, it is about decided, will be held at Utica, September 9-13. The Illinois State fair will be opened Sept. 29-Oct. 4, at Springfield. Virginia will hold her nineteenth exhibition at Richmond, Oct. 28-31. The Rhode Island Society will inaugurate their fair at Narragnsett Park, near Providence. It will last three days, Sept. 9-11. The Oregon State fair will be held at Salem, some time in Sept. or October.

One of our Brooklyn friends relates that he has accidentally discovered a very efficient remedy for gapes in chickens. It is dry, caustic lime. One of his chickens got the gapes; he caught the fowl and with a pen-knife dropped some caustic lime that happened to stand by, into its throat, and let it go. Next day the fowl had recovered. He mentioned his success to a friend of his, who applied the same remedy to three chickens with the gapes with the same result.

We glean from our English exchanges, and more especially from the trustworthy London Agricultural Gazette, that the prospects of crops in England are by no means such as to brighten the timid hopes of the English farmer. Wheat fields, 'tis said, present a deplorable appearance. "It is several weeks since we began to fear and now we quake." "How," they ask, "can plants which scarcely tinge a hill-side seen half a mile off, produce ears of wheat in six weeks' time and a fair harvest by August?" The plants are not only "thin but weak and badly colored."

Variegated Wild Plants.—Last week we found a beautifully variegated Red Clover plant, white and green. Last year we found two variegated wild plants. One was a Skunk Cabbage, variegated with a bright yellow—the other a variegated Plantain (Plantago Major), also splashed with yellow. The Skunk Cabbage was removed to our wild garden—the Plantain to a flower border. The seeds of the latter were collected and planted to ascertain if seedlings would also prove variegated—but they did not germinate. This spring the Plantain is as brightly variegated as it was last year. The Skunk Cabbage died.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

HER LAST WORDS.

No! Let me go alone—'tis better so.
My way and yours are widely far apart.
Why should you stop to grieve about my woe?
And why should I not step across your heart?
A man's heart is a poor thing at the best,
And yours is no whit better than the rest.

I loved you once? Ah, yes! perhaps I did.
Women are curious things, you know, and strange,
And hard to understand; and then, besides,
The key of her soul's music oft doth change.
And so—oh, do not look at me that way—
I loved you once, but that was yesterday!

Sometimes a careless word doth rankle deep—
So deep that it can change a heart like this,
And blot out all the long sweet throbbing hours
That went before crowned gold with rapturous bliss;
So deep that it can blot out hours divine,
And make a heart as hard and cold as mine.

Nay do not speak. I *never* can forget;
So let us say good-bye, and go our ways.
Mayhap the pansies will start from the dust
Of our past days—the slumbrous, happy days
When I was trusting, and life knew no grief,
But blossomed with my clinging, sweet belief.

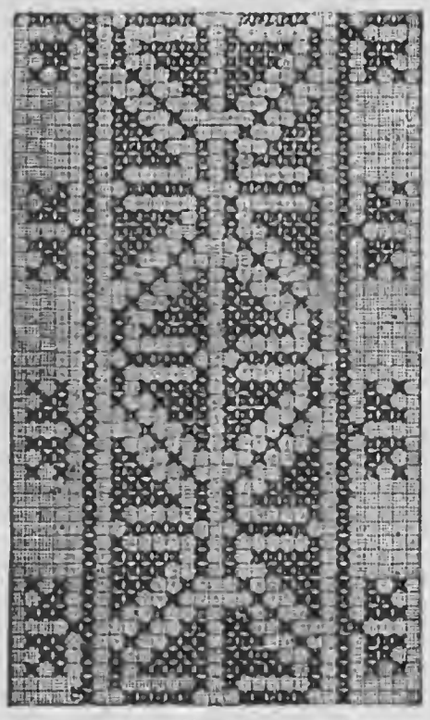
Good-bye! good-bye! Part of my life you take—
Its fairest part. Nay, do not touch my lips.
Once they were yours; but now, oh, my lost love,
I would not have you touch my finger tips,
And saying this I feel no chill of pain;
I cannot even weep above my slain.

If God cared ought for women who have loved
And worshipped idols false, I trust he will
Keep us so far apart that never more
Our paths may cross. Why are you standing still?
Good-bye, I say. This is the day's dim close;
Our love is no more worth than last year's rose,

[*Lady's Journal.*

DESCRIPTION OF CUTS.

No. 1.—SHOE-POCKET.—This pocket, which is intended to hang on the wall of a bed-room or dressing-room, is made of undressed holland, the back, and flap that turns down at the top, are cut in one piece, measuring twenty-eight inches in depth, and twenty-two in width. The pockets are cut ten inches in length; they are sewn to the foundation. Each pocket is formed by one large pleat, and ornamented with a braiding or embroidered design. The lower flap is cut separately, and measures seven inches in depth, this is ornamented to correspond with the pockets, and is scalloped and buttoned at the edges.



No. 3.

No. 2.—CHAIR-COVER EMBROIDERED IN CROSS-STITCH.—This cover is of crash, embroidered in cross-stitch with colored ingrain cotton. The cover is finished at both ends with fringe, and is tied to the chair with strings, as shown in the engraving. Covers of this kind are pretty, and serve to preserve the backs and seats of delicate chairs or to hide evidences of wear and tear.

NOS. 3 AND 4.—BORDERS IN CROSS-STITCH.—These borders are woven with colored ingrain cotton, and are suitable for table-covers.

THE WOMAN'S CLUB.

HOME STUDY.

As some of the "clubites" have from time to time referred to the Boston Soc. for Enc., of Home Study, perhaps a word or two from one of its students may be of interest to some one.

In December last I decided to join and I selected as one course, a history of the fifteenth and sixteenth centuries and was directed to begin with Seebohm's History of the Protestant Revolution. It is surprising what an amount of interesting and useful information one can extract from this book by a little study. It is admirably arranged for purpose of study. The marginal notes which appear on every page serve to fix the most important events in the memory.

To how many of us busy housewives are Savanarola, Chas. V., Francis I., Leo X, Lorenzo de Medici, Zwingel and Luther more than names? What do we know of their lives and times? And yet each of these men exercised an immense influence in his day and generation, an influence in many cases that we of to-day feel. Many of us doubtless know of Luther that he was an obscure Romish Monk who attempted to reform the church and who at the Diet of Worms defied emperor and pope, are we wise about his particular dogmas for which men have fought and died? Did he draw his inspiration direct from the Scriptures or did he merely amplify, emphasize, and secure a larger hearing for a doctrine already in existence? When this man stood before the proud emperor, surrounded by princes, and distinguished ambassadors from the court of Rome and dared all for conscience sake, did he strike a blow for religious freedom simply? Feudalism, what was it? How was it abolished? Is it true as claimed by a "Greenback" paper lately that gold and silver as mediums of exchange are relics of feudalism? I feel assured that not one farmer's wife in two hundred could answer all of these questions and yet a few hours reading would make any woman intelligent on these and a myriad of other topics.

I like the way of studying recommended by Miss Margaret Harvey in one of her letters lately. She says in effect (what is most true) that the mother of a family can not find time to seclude herself for a stated time, but if she only "studies as she goes," ironing, washing, baking, sweeping or sewing, she can accomplish much and lighten the drudgery of every day life.

One delightful feature of the Boston Society is that when in studying the books recommended in the regular course, if you become especially interested in an individual, a city, a system or an epoch, you can by asking your lady correspondent find out the books which will give you precisely what you want to know. For example, I wanted a portrait of Florentine manners in the fifteenth century and was directed to read George Eliots' Romola. Those of you who have read the book, know how excellently it suited my purpose. So, to give me an idea of the social life and times of Luther, Schonburg Cotta Family, was recommended. Shakespeare's Henry the Eight, was suggested when I was reading the history of Henry VIII's matrimonial complications. All this was outside of the regular course.

Ladies, one and all take my advice and join the society next October, even if you can only study ten minutes a day, Cordially.

MRS. TEMPLINE.

WHAT A DELEGATE FROM THE OIL REGIONS HAS TO SAY.

I AM very much interested in the RURAL, and especially so in the "Woman's Club." I have often thought I would like to join although I don't know as anything I could write would be of benefit to any one, however, I always had a desire to see myself in print, and if this letter is not consigned to the waste basket (that bug-bear of aspirants to literary fame,) I may be able to assist some poor, weary sister, as I have been encouraged many times by reading hopeful words written by some of the other club members.

I agree with Sarah. There are a few—one at least—interested in hearing about the Boston Society to Encourage Study at Home. I wish those who understand its workings would write more about it. I am a very warm friend of education, whether it be book learning, kitchen learning, or that taken from the great book of Nature and taught by the Great Master who knows all things.

I should love to take a course of study from this society, but have not the courage to undertake it and I fear not the strength to carry it through if I did. With delicate health and three little children clamoring for mama's constant care, and a farm-house and husband (?) to overlook, I hardly have time to avail myself of the Society's liberality.

I find, however, that it is not necessary to settle down into a domestic drudge and nonentity, even among the hills and rocks of Pennsylvania's oil region, where strangers suppose there is nothing but rocks and oil. I live in a beautiful farming neighborhood in the middle of Oildom. From my home we can see gaslights from oil wells in every direction. We have the best of markets, and with fourteen towns of greater or less size within a radius of twelve miles, we ought to be happy, but we are not. We poor mortals always want a "little more" or something a little different. We are too far from railroad (four miles;) too far from church (one mile;) too near some great rocks in the woods, etc., etc. Why can't we be satisfied with what the Great Giver of All sees fit to give us? Especially ought we to be happy when for a trifle the RURAL PUBLISHING CO. furnishes first-class reading matter of every kind, and even allows us *poor down-trodden women* to condole with each other and air our pet hobbies; then it makes us the recipients of so many favors, viz.: clocks, seeds, etc. I can't imagine what this Company's next freak will be; possibly each subscriber will be forced to receive a lease of Western farm land, or a residence on Fifth Avenue.

Now, I have written a great deal without even hinting at the subject I set out to discuss, viz.: "carpet sweeping." This subject of carpet or no carpet I find is agitating the public mind considerably. I, for one, am in favor of a good rag carpet on the sitting-room floor, and with reasonable care there is no need that the room be filled with dust at every sweeping.

In the RURAL of April 12, Mrs. D. L. B. suggests the "use of salt for dust." Allow me to give my experience with it: Three or four years ago, a young lady boarding with me sprinkled salt on the carpets of the sitting-room and chambers, for the weekly sweeping. Afterwards I noticed that in the corners of the rooms the carpet was sticky, and the castors of the bedstead were so rusty they would not move. The pedals of the sewing machine were also covered with red rust. I was at a loss to account for it for some time, but Mary explained it, and I stopped using salt, as a *disinfectant*. I have always found it worked well to dip the broom in a pail of clean water occasionally, while sweeping. This will keep down the dust pretty effectually. Shake the broom well out of the water, and do not use all the strength at command, and so send the dirt across the room at once, but take your sweeping easy. Also take your carpet up and give it a good beating every six months. C. E. J. OF OILDOM.

ENGLAND'S QUEEN.

I WONDER if there lives a woman who has been more over-praised than this one? The anniversary of her birthday, which occurred lately, was made the occasion for such a flood of adulation as was positively nauseating to one who stopped to reflect on the unworthiness of the subject of it. She is praised for being a good wife and mother. Are mothers and wives of this class so rare that a woman is to be extolled for simply doing her duty in these relations? If it is claimed that people of her rank have temptations which do not assail those in the lower walks of life, one can very promptly dismiss this by pointing out that we do not live in the eighteenth century, and the profligacy which characterized the courts of this woman's ancestors would not be tolerated now. Whatever her inclinations, she would be compelled to conduct herself with propriety. As to being a good mother, the eldest son, to say the least, does not reflect the brightest luster on her training. This, so far as I can understand, is about all that there is to be said in her favor, that she is negatively *good*. Not grandly good, but she simply does her duty by her immediate family. Rather a remarkable characteristic of the head of a nation; the nominal ruler of millions of people.

Washington and Lincoln are revered in this country not for their loyalty to their wives, but for the noble services they rendered their country; and likewise the memory of an Arnold or a Tweed is execrated for the crimes committed against society, and the fact of the man's being a loving husband or father does not lessen his condemnation in the least. Victoria is avaricious and petty to a degree which would disgrace her meanest subject. When her children marry she comes like a pauper before the people and asks for a settlement on them. Asks, too, when she knows that the burden of the extra expense will fall on her poorer subjects. Want, squalor and wretchedness are almost at her palace gates, and not only does she refrain from relieving the poverty, but she will not provide for her own children out of her abundance.

Think of a woman in her station giving time and attention to devising just how low in the neck and how short in the skirt, gowns worn at her receptions must be! Then, too, she showed her inexpressible littleness when she slighted Mr. Gladstone in not inviting him to her son's wedding. "This is my wedding, and I intend to invite whom I choose." As the English people paid the bills, it seems to me it was hardly her wedding, and besides it was in rather bad taste to insult a statesman who has rendered such glorious services to his country. The trouble with Mr. Gladstone is that he lacks that obsequiousness of mind and manner which is such incense to the vanity of those small souls.

Contrast this compound of arrogance, pettiness and avarice, who has had all the advantages of living in this cultured age, with Zenobia, that desert queen, who, though born seventeen centuries ago, challenges the admiration of every generation. Brave, generous, noble, *there* was a queen to worship. By her side how insignificant appears this much extolled Victoria?

One who believes in giving
"HONOR TO WHOM HONOR IS DUE."

No. 2.

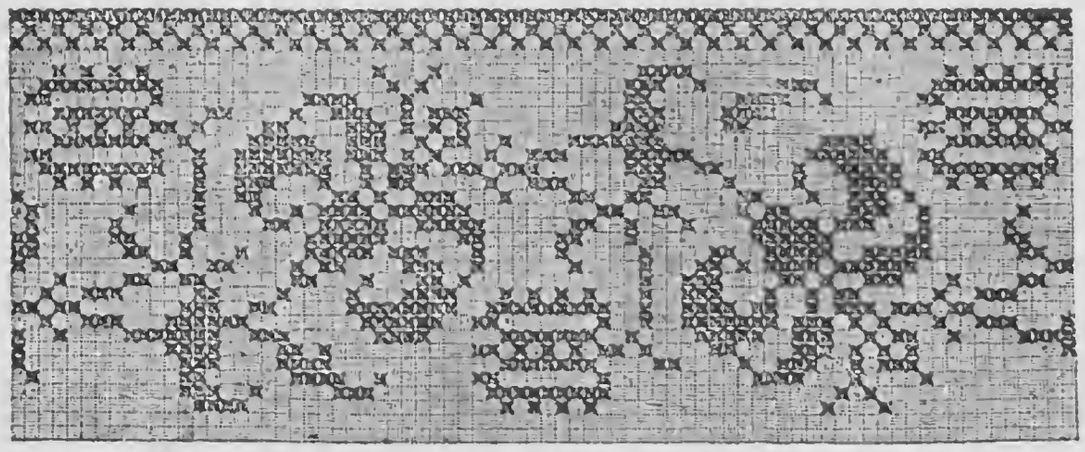
SOME REMARKS.

I HAVE been reading Washtenaw's article in the "Club" of April 5, and I cannot but wonder what sort of men she has known all her life. I am curious to know where she lives. Let me quote a little: "Men insist that women shall be beautiful. No speech is too coarse or too bitter to characterize their utter contempt for plainness in a girl."

There is no doubt that men admire beauty in a woman, I think we all do. I know that a beautiful woman is as much an object of admiration to me as to any man who ever lived. I gaze upon her with never-wearying delight; and if, with beauty, she has good sense and a good heart I glory in her as an ornament to the sex.

Washtenaw says that Sir Owen Chevenix but voiced the sentiment of his sex when he declared he preferred beauty to excellence of character in a woman. Perhaps it may be the preference of some of the more coarse and sensual among men, but spiritual and mental worth seeks its kind. While I see plain, yes, *homely* women wooed and won, in preference to belles and beauties, by men of excellence and talent, I cannot but feel that Washtenaw's sweeping criticism is unjust.

It is in no censorious spirit, my sister that I write these words but just for this reason: I have noticed that men in writing and speaking of women are apt to put a *part* for the *whole*. Are some women frivolous and silly?—they at once issue a proclamation—"Women are vain creatures, with no thought above a fashion-plate." Is one woman inefficient and weak? The flat goes forth, "Women are helpless and incapable." Of course I do not say that *all* men are so unreasonable.



No. 4.

Now, I want women to be above doing such injustice. I believe our sex is worthy of being vindicated in a dignified, candid manner. That the subject is not so weak as to need vituperation or sophistry; but that it may rest solely on an impartial statement of its merits. And I do not think it necessary for us to assume an attitude of hostility. That is another fault of some masculine writers. They say things of women in general that they would not hear said about their own mothers, or wives, etc., without anger. Now when we arraign mankind we include our fathers, brothers, etc., men that we love and honor. Let us, while asserting our rights, do it in the spirit of dignity, candor and charity. Hoping Washtenaw will "suffer the word of exhortation" in the spirit in which it is offered, I remain cordially,

CLYDE RAYNOR.

CORRESPONDENT'S CORNER.

LOVE IN OYSTER BAY.

[The following poem is sent in response to an inquiry in the "Correspondent's Corner."]

I AIN'T anybody in particular,
And never cal'lated to be;
I'm aware that my views doesn't signify
Except to Belinda and me;
But I'm heavy on openin' oysters—
In regards to them I am free
To remark that, for shellin' of Blue Points,
There is few that can lay over me.

Excuse my perfessional blowin',
It isn't the point I would make,
But I'm feelin' particular airy,
And uncommonly wide-awake;
And I've got to be talkin' about it,
It won't lay quiet, you see;
Which the name of the girl is Belinda,
That's took an affection for me.

It's surprisin'—the fact is surprisin'—
Just cast your eye over this frame!
Is there anything 'specially gallus
Which characterizes the same?
As a model for makin' wax figgers,
I shouldn't make much of a stir;
But I ain't a-goin' to worry,
So long as I'm pleasin' to her.

An impediment hinders my speakin'
As I should admire to do;
As an elocution professor
My scholars would likely be few;
But she said, when I mentioned it to her,
"Why, dear, don't you fret, for, you see,
You tell me you love me, my darling,
And your voice is like music to me."

I was never indicted for intellect,
Nor never arrested for cheek;
But I'm holdin' my head elevated
Since Thursday night was a week;
For that was the date when Belinda
Allowed she was partial to me
And give me a relish for livin',
And a notion of workin' for she.

She isn't exzactly a beauty,
And also she uses a crutch;
But the eyes of that dear little cripple,
The heart of an oyster would touch.
They is wonderful soft, and so lovin',
A good-lookin' face on the whole,
For the light in them eyes seems to travel
Right out from a beautiful soul.

If she had been lively and hearty
I couldn't have helped her, you see;
And similar, then, it ain't likely
That she would have took up with me;
And I shouldn't have know'd her and lov'd her,
So patient and gentle and sweet,
And I wish that the whole of creation,
I could lay at her poor little feet.

I was never so chirk and gallaptious,
And never before felt so spry:
And I've just took to noticin' lately
How amazin'ly blue is the sky:
And how gay is the stars in the night-time,
A-winkin' an' glimmerin' down—
Good gracious! I come near forgettin'
That barrel of oysters for Brown!

PELEG ARKWRIGHT.

AGUE CURE.

A NEVER-FAILING remedy for ague in the breast, is to wear a very small bag filled with alum. It must be worn continually while nursing a child. A neighbor has practiced it for the period of twenty years, and is now nursing the sixth child. After the birth of this last child, she did not at first think of using the alum until reminded of it by husband one day, when she immediately had a bag made, holding about a large thimbleful of the alum, and attached it to a string, suspended it about the neck, slipping it down next the skin between the breasts. She now washes in cold water, and does all manner of imprudent things, such as hanging up clothes, bare-headed, bare-armed, but has had no return of ague. A number of others to her knowledge have used it with the same good results. This simple remedy is, indeed, worth being known by the masses of the people, when we consider how much some women suffer with this distressing and sickening complaint.

I have seen salt recommended to be eaten with walnuts, so as to prevent indigestion, but I think I prefer eating the walnuts without any such condiment. If lovers of nuts of any kind, will drink a cup of sweet milk after eating them, they will not experience any unpleasant sensations, and can eat a great many more with impunity.

BROWNIE.

I WOULD like to have some of your readers send the words of the beautiful poem

'The Flowers that I saw in the Wildwood,'

and have them printed in the dear old RURAL.

A. E. S.

WANTED.—The words of a little poem, in which the boy-lover calls his little lady-love his "heartsease." The sentiment is charming. I would like to see the poem in the RURAL. Also, which is correct,—"When Greek *meets* Greek then comes the tug of war, or, "When Greek *joins* Greek, etc. H.

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 365.)

CHAPTER XXI.

THE MISSING BOOK.

IT certainly seemed as if Hillian Gray was conscious that her actions wore a doubtful air, or else that she was shunning the explanation Noel had hoped she would give him unasked; for, from this time she avoided being left alone with him. Dr. Monson, finding his patient's pulse more equable, removed his embargo; Noel was daily lifted into a reclining chair, and this was wheeled into an adjacent room, where he was permitted to receive as many visitors as he pleased, on the sole condition that he retained a recumbent position, and did not suffer himself to become excited.

Hillian Gray was just as ready as of old to wait upon him, to bring him flowers arrange his cushions, or select books for him from the library; but she always found some pretext for absenting herself during those hours which Mrs. Hurst devoted to the housekeeping, and Irene spent in the society of her lover.

Noel sighed, but endured the change without comment. If she could not explain away the circumstances Clement Dunforth had revealed, it was as well that they should meet as seldom as possible. A little while, and they would be entirely separated; for when once able to turn his back upon Carlsforde Park, he was fully resolved never to behold it more. It would have been very pleasant if he could have carried away with him none but pleasant recollections of his gentle little nurse; but Fate willed it otherwise, and he must be content.

Clement Dunforth continued to pay daily visits to his betrothed, and generally presented himself at Carlsforde soon after luncheon, to accompany Irene and Hillian in their customary ramble.

Hillian Gray appeared to have overcome her dislike to him, or, if she still retained it, the feeling was not permitted to appear, and though it is true that she rarely bestowed upon him the sweet sympathetic smiles Noel had loved to evoke, she treated him in all other respects as a friend.

Sometimes, indeed, Irene evinced a little jealousy of her lover's attentions to "that Miss Gray," complaining that, during their walks, they talked over her head—or, in other words, discussed subjects too abstruse to interest her—and then Hillian would look distressed, and endeavor to excuse herself from being the companion of their walks. But Mrs. Hurst's notions of propriety would have been outraged by the lovers strolling farther than the gardens alone; and Clement Dunforth lectured his betrothed so sternly on the childishness of her complaints, that Irene, frightened and subdued, did not venture to repeat them.

Either the tears that sprang into her eyes awakened his compunction, or he feared that she would report his harshness to her brother, for, with unusual tenderness, he drew her into his arms.

"My dear little girl! do you forget how I told you, under a promise of secrecy, some days since, that our marriage depends on our conciliating Miss Hillian Gray?"

"You told me this, I know, and I thought I understood it at the time, yet—"

"Yet your high spirit and affection for me makes you impatient when you fancy me too attentive to the young lady. Thanks, darling, for the compliment. If you did not value my attentions highly, you would not grow angry without cause."

"I am not jealous, Clem, only——"

"Only you think with me that it is very hard to be forced to waste civilities on a third person when we have so much to say to each other. Quite true, dear; but tell me how it is to be helped. Your brother, though the best of fellows, is over scrupulous. He persists that we must not marry till we are in better circumstances."

"I am not afraid of poverty," cried Irene; but there was a little tremor in her voice as she said this, for she had had some trying experiences of the carks and cares that beset a household when the money comes slowly in.

"Neither am I, for myself, but for you—ah! sweeting, I want to be able to deck you in silk and velvet, to hang jewels in these pretty ears, and see my bride admired in the theatre, and the park, for the elegance of her dress, as well as the beauty of her face. A few hundreds per annum, which Miss Carlsforde with her large income could not miss, would put it in my power to bestow on you all these things; and so, Irene, dearest, we must not offend little Hillian Gray."

"You think she has such very great influence over our rich kinswoman! But how can that be? If Miss Carlsforde were so much attached to her, would she not have taken her with her?"

"By no means. It is precisely because she has implicit trust in the girl that she has left behind. Mrs. Hurst is a nonentity; she appears to rule, but it is only as her niece directs. I have been a close observer since I have been here, and I am firmly convinced that our future depends entirely on whether we win or lose the good opinion of Hillian Gray."

"Oh, but that's nonsense," exclaimed Irene, but rather timidly. "You will always have your professional income, and——"

"And it will barely find us in gloves, you inexperienced child. If we marry on that we condemn ourselves to misery."

"You did not say this at first, Clem."

"My dear, I only say it now to impress upon you the necessity of propitiating our clever little friend. If you will but consent to be guided by me, and not give way to silly fits of temper—which spoil your good looks, by-the-bye—I will so work upon Miss Gray that all our hopes shall be realized. If you will not be quiet and patient, I had better return to town, and let Noel defer our union, as he is now striving to do."

"Of course I shall be guided by you," Irene promptly replied. "I love Noel very much; he is the best of brothers; but when he tries to part you and me, it is more than I can bear. You think, then, that Hillian Gray will prevail upon Miss Carlsforde to settle a handsome sum upon us?"

"Certainly; is it not her duty to do so? You and your brother are the nearest of kin. Only wait another week or two, and rely upon it you will find that I am right."

Irene promised everything he demanded, for her faith in her lover was implicit, and Noel little dreamed that Clement's wily hints were gradually estranging from him the open-hearted, impetuous girl who had been wont to rush to him with all her troubles. Once induced to think that her brother was permitting his pride and his too scrupulous honesty to interfere with her happiness, it was not difficult to persuade her to be silent respecting Clement's schemes on the money-bags of the heiress.

Her brother noticed that she was not so loquacious as she used to be, and that if she chatted to him, it was rarely she named her lover, but he saw nothing suspicious in this. He was endeavoring to absorb himself in the writing of some essays, wisely thinking that to employ his mind would be the surest way of banishing the image of Hillian.

It was while thus employed that he sent Jephson to the library for the second volume of an historical work to which he wished to refer. But the old man was unable to find it, and Noel, who could not proceed without it, had been lying for an hour or more fretting at his enforced idleness, when his sister and Hillian Gray, accompanied by Clement, returned from a ramble.

Irene was peevish; for she had left the others to follow a squirrel, and had contrived to lose herself in the wood, through which they had been strolling, while Hillian was more than commonly distrait; but Clement Dunforth was in excellent spirits, and talked for both so gayly, that Noel, interested in spite of his dislike of the speaker, forgot the missing book till some turn in the subject under discussion reminded him of his unfinished work.

"Jephson is an old stupid!" said his sister, crossly. "It must be on the same shelf from which I brought you the other volume."

"But he assures me that it is not. I wish you would look, Irene; it would much oblige me."

She rose to go, then paused, saying, hesitatingly:

"Will it not do in the morning? It is growing dusk, and I never venture into the library after the shadows begin to gather."

"Let me go with you," said Hillian; and thus accompanied, she no longer objected.

The book was found, and after his friends had left him for the night, Noel, not feeling sleepy, opened it to read the passages he so wished to see. As he turned over the leaves, a sheet of paper fluttered on to his knees, where it lay unnoticed till his studies were over. Then, thinking that some one had used it to mark a place, he was about to return it to the book, when he saw that it was an unfinished sketch in crayon of himself.

Whether the likeness was or was not a good one, he did not attempt to decide. What interested him in it was the fact that this sketch did not represent him as he now appeared; but had evidently been taken the night that he sat in the library, and beheld the inexplicable figure lurking in the gloom. Could he doubt any longer that it was Miss Carlsforde who had stood there gazing at him, or that this book had been in her possession quite lately?

CHAPTER XXII.

NOEL'S LETTER.

THIS discovery engrossed Noel's thoughts during the night, and he debated with himself for a long time what use he ought to make of it. That Miss Carlsforde was either in the house, or dwelling so near that she could enter it whenever she pleased, he was now quite convinced; but who was in her secret? That it was very carefully kept was certain, from the fact that, with the exception of the one alarm in the library, Irene—the restless Irene, who wandered at will all over the mansion—had never beheld anything to excite her suspicions that the heiress was at hand.

The question that now arose was this: ought he to respect her desire to conceal herself, or use the privilege his kinship gave him, and endeavor to persuade her to take her proper place in her father's house? To know that she, the legal owner of all around him, was lurking in the dark, was an unnatural state of affairs, at which he ought not to connive; yet on the other hand, to harass or distress the unfortunate girl, who was already sufficiently tried, would be inexcusable.

If it had not been for that wretched suggestion of a marriage between them, Noel would have felt less delicacy concerning the mode of addressing her; or if Mrs. Estcourt had not unfeelingly given the heiress to understand that she ought to atone for her father's one-sided will, he would have unhesitatingly pressed his friendship upon her. Now he knew not whether to make advances, or behave as if ignorant that she was near. If he did the first, she might resent it as an unwarrentable action, seeing that she so determinedly avoided him; if he took the other course, a much-wished-for opportunity would be lost of reconciling her to her position, and inducing her to believe that he could never be prevailed upon to take advantage of her generous renunciation of her rights.

Once he would have taken counsel with Hillian Gray, and begged her to advise him. Whether she was or was not the confidante of her eccentric patroness, she could not have refused to hear, and aid him in his decision. But those golden hours in which she used to linger beside his couch, always ready to compare opinions respecting some book she had been reading aloud, or amuse him with some morceau of village gossip, were at an end; and he could not resolve to pointedly ask her to grant him an interview, knowing that the request must be made in the presence of Clement Dunforth, who contrived to be always hovering near her chair, and in some inexplicable manner engrossed all her attention.

At last he decided that he would take no one into his counsel but Jephson, and, drawing towards him the desk that stood at his elbow, he commenced a letter to the unseen *demoiselle*, yet, as the first words, "My dear Miss Carlsforde," were written, he paused and laid down his pen. Would it be generous to reveal to her that she had betrayed herself? She had proved by her behavior that she was of a very sensitive nature, shrinking from the notice her misfortunes drew upon her, as much as from the awkward position towards himself in which his accident even more than the terms of the will had placed her.

"I am her guest because I cannot help myself," he muttered, "while she is my hostess because it would have been positively brutal to remove me in my dangerous condition; and thus we two, who would have anything in reason to avoid each other, are by a strange chain of events kept within the same walls. She, poor girl!—terrified, doubtless, by the usage she received from the cold world into which she fled—has crept back here to hide until I quit Carlsforde or accept her noble offer.

"This I cannot do; but ought I to depart without endeavoring to make the acquaintance of the warm-hearted young creature, who would have loaded me with benefits, and whose friendless state is truly grievous? She has sufficient interest in me to steal into the library, that she might see for herself what her father's successor resembled; perhaps she is even now longing to know Irene and myself—for are we not of her own age and blood?—but is restrained by her repulsive appearance. Surely it is my duty to smooth away the obstacles to our intimacy. If I could contrive to make her comprehend that none but kindly motives dictate my wish to know her, would she not accept my friendship?"

At last Noel contrived to finish a note to Miss Carlsforde, that expressed his feelings tolerably well. He began by saying that he had reason to think she had returned to the neighborhood, and he rejoiced at it, as he hoped she would let him have the pleasure of seeing and thanking her for the hospitable treatment he had received at Carlsforde.

"As soon as I am sufficiently recovered," he added, "I intend to carry out a long cherished wish, and go abroad; but ere I leave my native land, pray let me have the very great satisfaction of seeing you reinstated in your own house, and thanking you for the generous though mistaken readiness with which you would have resigned in my favor. I think you would be happier, as well as myself, if you permitted me to convince you by word of mouth that I am not leaving England a discontented or disappointed man."

He was not exactly satisfied with this effusion; but had made so many abortive efforts, that he resolved to let it go; and having sealed and directed it to "Miss Carlsforde," he called Jephson, and bade him carry the epistle to the library, and lay it upon the table on which the jewel-cabinet—now removed to his own chamber—had once stood.

The man's astonishment at the request was so great, that it was plain he knew nothing of the young lady's proceedings. He did as he was bid, but watched Noel afterwards with a grave concern that amused him. He evidently thought that his charge was inclined to be delirious, and hinted as much to Dr. Monson, when he paid his next visit. He looked still more perplexed when, on the morning of the following day, he was desired to go and see if the letter was still lying where he had been told to leave it; but he came back again to demand angrily if some trick was being perpetrated upon him.

"The letter—the letter!" cried Noel, eagerly.

It was gone. Some of those jades of women, the maids, Jephson declared, must have meddled with it. But Noel took another view of the case, and compelled his mystified attendant to promise silence. That it was Miss Carlsforde herself who had seen and taken away his epistle he felt tolerably certain, and he was content to wait until she vouchsafed the reply he had earnestly begged her to send him.

He now resolved to reveal what he had done to Hillian Gray, and gather from her looks and manner while she listened, how far she was cognizant of Miss Carlsforde's presence in the house. But it was not easy to do this. Hillian avoided him, plainly and positively avoided him; and when he did contrive to catch her eye, the crimson flush that stole into her cheek was that of anger. Yet how could he have contrived to offend her.

He was asking himself this question one afternoon, when the change in her manner had been forced upon his notice, while Clement Dunforth, who continued to find time for long and daily visits to his betrothed, was sitting beside him; and the keen-sighted young lawyer must have divined the nature of his thoughts, for he commented, with a sarcastic laugh, upon Hillian's reserve.

"I thought that you and the young lady who had just left us so abruptly were excellent friends. Irene certainly told me as much."

"I am very grateful both to Miss Gray and her aunt for the attention they have bestowed upon me," answered Noel, stiffly. "If Irene told you this, it was quite correct."

Clement suddenly laid his hand on the speaker's shoulder.

"My dear fellow! you must not affront this girl. You really must not!"

"If you are alluding to Miss Gray——" Noel began, with displeasure; but, without heeding him, his companion went on:

"Or, if you have been so unfortunate as to wound her *amour propre*—she has a tolerably large share of it—pray do your utmost, to heal the breach. You have just the soft, caressing manner that goes so far with the sex, and a few civil speeches, or a well-put compliment to her one passable feature, her *beaux yeux*, may induce her to forgive and forget your offence."

"Why do you give me this advice?" asked the annoyed Noel.

"Need you ask? Pshaw! you are less observant than I imagined, or else you have a motive for feigning ignorance."

"I really fail to catch your meaning, Mr. Dunforth," said Noel, more coldly than before. "Oblige me by explaining yourself. You have given me some very unpalatable advice, worded in a style I did not admire, and for what reason?"

"For the simple one that demure, low-voiced, meek, little Miss Gray is not as insignificant a member of this establishment as she pretends to be. I happen to have learned—never mind how—that she stands so high in Miss Carlsforde's favor, that her word may make or mar our fortune."

"Now you talk nonsense!" Noel retorted. "Miss Gray may possess all the influence you assert—I hope she does, for I do not think she will employ it unwisely; but it will never be exercised on my behalf, as I certainly do not intend to lay myself under more obligations to Miss Carlsforde than I am at present."

Clement's incredulous smile was excessively provoking.

"My dear fellow, we do not commonly consider that we are laying ourselves under any tremendous obligations when we make proposals to a lady and she accepts them. If she gives us her hand and her property, we more than requite her with our love, our protection, and so on. But you will most certainly never win the heiress if you do not propitiate her confidante."

"I would not win her by such debasing proceedings, even if I wished to do so," was the indignant reply.

"And yet," he was coolly told—"and yet you have given Miss Gray cause to think that you are anxious to find favor in the eyes of the heiress. At any rate, that is how she has interpreted—but I beg your pardon, I have no right to break the confidence reposed in me, nor to remark upon anything you choose to say or do. I only proposed to give you the friendly warning of which, in your ignorance of Miss Gray's real character, I feared that you stood in need."

"Thank you," said Noel, in anything but a grateful tone.

"I should like to see you master here," Clement went on, quite enthusiastically. "It is your proper place, and you will fill it well. It certainly is hard—very hard that there is but one way of getting at your rights. To a man of an honorable turn of mind, the idea of currying for the smiles of my lady's dependent, before you can get to the ear of my lady, is simply disgusting."

"So much so, that depend upon it, I shall never degrade myself by attempting it," he was angrily told.

"Well, don't flash such indignant glances at me! I did not suggest anything of the kind. If it had not been hinted to me that you had already determined to go in for the heiress, I should not have presumed to warn you that you were making a mistake in affronting the little Gray."

"You pay me a very equivocal compliment when you acknowledge that you believed me to be adopting such a dishonorable course," Noel exclaimed, speaking even more resentfully than before.

Clement only shrugged his shoulders.

"We men of the law hear and see strange things, and you would not be the first who has suffered a handsome dowry to blind him to the imperfections of his bride. But here comes Irene across the lawn," he added, glancing from the window by which for the last five minutes he had been lounging, "and she looks as if she were in trouble; so you must excuse me if I run away to learn what has happened, and console her." To be continued.

AN ENGLISH HUSBAND.—It is a common boast with English people and their admirers that English women are the only wives who are real companions to their husbands. We are told that they can ride, walk, sail, and climb Alps; that they wear stout shoes and sensible clothes; that it is delightful to behold them sharing their husbands' healthy pastimes. It is true that English ladies do all these things; it is touching to think of the trouble they must take from their earliest years to fit themselves to be the companions of men. Anybody who has seen one of them in the full enjoyment of her privileges—coming into Chamouni after crossing the Col du Geant, for instance, hot, draggled, with a cold in her head and no skin on her nose, trudging half a furlong in the rear of a silent, cross-looking man—must have been impressed with their ideal of human felicity. A remarkable example of this perfect union in pleasures and pursuits has lately been given in Lady Anne Blunt's travels among the Bedouin tribes of the Euphrates, noticed in our last number. Lady Anne is an Englishwoman of excellent birth and accomplishments, a musician, an artist, a linguist; she is nearer forty than thirty years old, and the mother of several children; her title and fortune are her own; and whatever rank, wealth and the incomparable English system of female training can do for her sex has been done for her; she is fitted to be the companion of a man. We may learn from her book the use to which her husband, Mr. Wilfrid Blunt, puts her gifts and acquirements.

Mr. Blunt, it would seem, does not like England in winter, nor an indoor life, nor to be balked of anything on which he has set his mind; so he and his wife set out in the autumn of 1877 to pass the winter in Asia, without a notion of where they were going or how to get there. When they were fairly out of sight of Europe, Mr. Blunt took it into his head that he should like to migrate with the Bedouins.

"Wilfrid, without thinking that the answer would be an encouraging one, asked whether it would be possible for a European to tack himself on to a tribe, and so make the journey with them. Mr. S——" (the British consul at Aleppo), "to his surprise, answered that it certainly could be done, and why should we not do it? According to him, it would not even be a dangerous experiment, and only tact and patience would be required in enduring the tedium of Bedouin life during several months, and the courage to be all that time beyond the reach of Christian help. Wilfrid is now full of the idea. For me, I am only afraid of being away from England longer than we intended, and we should get no letters all the time; otherwise, the plan seems agreeable enough." Preparations were set on foot at once, and Lady Anne's work began with superintending the manufacture of a tent, which she made in great part with her own hands. While these were going forward news came from the desert that war had broken out among the tribes: "On the whole, a pretty kettle of fish, and our prospects are growing doubtful. Wilfrid says our best chance is to join Jedaan" (one of the chiefs) "at once, help him in his fight with Ibn Rashid, and then if victorious go down with him South as he pursues the enemy. But this will depend on the chances of war."

They set forth through a thirsty region inhabited mainly by wolves, jackals and hyenas, with an occasional lion, and perambulated by fierce tribes at war with each other, by rapacious Turks and Arab banditti, where there were long days' journeys over sand and stone: in a word, through the desert. They traveled on horseback, Mr. Blunt having a very fine mare, Lady Anne a very rough one: they always started in the morning, as he had determined the day before, whether it were raining pitchforks or blowing great guns.

At first the cold was so bitter that her hands and feet suffered excruciating pain, and then lost all sensation; afterward the heat became so intense that she was glad to dismount sometimes and rest in the shadow of her horse. They habitually slept in the open air, amidst their horses, camels, asses and native attendants, or, for a change, in a khan check by jowl with muleteers and zaptiehs (Turkish soldiers), or in a caravan, or in an Arab camp with men, women, children and animals crowding into their tent all night, mauling and pawing Lady Anne and making inquisitive, impertinent remarks. They lived precariously upon the game which Mr. Blunt shot by the way, on the dried provisions they had with them, or on the fare of the friendly Arabs. "Milk was brought, and dates, with fresh butter rather nastily plastered into the dish by the very evident thumbs of the women. . . . Half-baked loaves of dough set to garnish the edge of the plate, all damp and clammy, and half sopped in the broth. In the middle lay the great fat tail of the sheep, a huge lump of tallow, with bits of liver and other nastiness near it." When they were fortunate enough to find water, it sometimes tasted of asphalt, sometimes of soap. "The water is very muddy, but quite sweet," writes Lady Anne, cheerfully, one day when they were in luck; "it comes from some pools of rain-water, and rain-water is always good."

The hardships of their life were too much for their servants, although the latter were children of the soil, and their party was finally reduced to two besides themselves—the man-cook and a young lad; in which defenceless condition they traversed lonely tracts infested by bands of murdering robbers. Lady Anne was left alone in camp when Mr. Blunt was rowling, and sometimes rode alone, entirely alone, for hours while he went off on a scout or survey. He left her one morning in her tent on the outskirts of Tadmor to get information about a journey of several days which he meant to make without her: during his absence her tent was overrun by insolent people of the lowest class, and her position was beginning to be very unpleasant when she was reinforced by a visit from the mother and the sister of a citizen of some consequence. They told her that the male inhabitants of the place were real "men of Belial," and that they themselves durst not go about alone.

She had plenty to do, altering the stuffing of the saddles when they rubbed the beasts' backs, helping to pack the baggage, saddle the horses, lade the mules, pitch and strike the tents, cut green stuff for the mares' supper, get up in a cold night to cover the quadrupeds or catch them when they broke loose and scampered away. When they fell in with Turkish or Arab dignitaries it was her part to fulfil the tedious exactions of Oriental etiquette as became a gentlewoman, while her husband went hunting with the sheyk. To these tasks must be added that of keeping Mr. Blunt in a good-humor. "Whatever we do had better be done quickly," she observed at one stage, "as Wilfrid is fretting at this life in-doors." Yet in sight of Palmyra he hears a bird sing and becomes homesick. When, after marching for months and riding hundreds of miles, he finds a Bedouin tribe which they can join, he stays with it less than a week. Some of his marital qualities appear in the following story: "We were obliged to alter our course northward and skirt the shore of the lake, looking for a place where we could cross, for the upper part was evidently quite shallow, though about three miles in width. At last we came to the track of a camel leading across the wet mud, which we could trace for a long distance till it disappeared in the mirage, and Wilfrid, impatient to go to the tents, determined to follow it, while the guide" (who was nearly blind) "and the rest of the party should go round the head of the lake. I foolishly went with him, and, doubting the soundness of the bottom, did so on foot; but I had not gone more than a few hundred yards before I was quite exhausted, and my boots and skirts were so clogged with mud that I was unable to get any farther. I confess that I was rather frightened, for already there was such a dense mirage that we could not see anything round us but the uniform expanse of mud, and we had left the camel-track, which meandered about; and I thought we were going to end our days in this miserable place. But Wilfrid would not turn back, and at last I managed to scramble on to my mare, and then found matters less hopeless, for the mud was not really much over her fetlocks, and did not get any worse."

Lady Anne never complains of her husband, who is apparently a hero in her eyes, and she often quotes his wit and wisdom, but we get an impression of his disposition from bits of unconscious testimony. She complains of nothing, in fact, but once or twice betrays her feelings by a laconic "Inshallah!" the Mussulman equivalent of the Italian "C'e vou pazienza!" It is to be observed, however, that her only outbursts of enthusiasm are over a clean, carpeted bedroom and a well-set dining-table.

The reader follows this courageous, good-tempered lady through four months of an existence which differed in no essential from that of a camel-driver. Her sufferings from heat, cold, hunger, thirst and fatigue were severe enough: it is not pleasant to think of what she must have suffered from circumstances at which one can but guess—the close and constant contact with low, dirty, semi-civilized scoundrels, the total impossibility of observing any of the decencies of life. If she felt these things as keenly as was natural in a person so born and bred, it seems almost intolerable: if she did not, it is worse. A high motive lifts mortals above conventional standards. A woman may undergo trials for the love of God or humanity which would degrade her in a lower cause. But the Blunts were neither explorers like the Petherieks and Bakers, nor missionaries, nor even, by their own admission, professional travelers or sight seers. They had no object that can be discovered in their journey except to relieve Mr. Blunt's *ennui* and restlessness. Lady Anne was not a martyr to religion, philanthropy, science, necessity or love of gain. She proved herself worthy of the epithet which her countrymen bestow as their capital commendation upon a woman, "a good fellow," but we cannot help thinking that she was unsexed.

As I began by saying, this book puts the fondness of Englishmen for taking those whom they term "their women" with them everywhere in its true light. They cannot be accused of making woman a toy, but they make her a fag. Lady Anne Blunt's duties and occupations are those of a squaw. Mr. Blunt gives his approbation to the record by editing it himself, and adding a few chapters on Arab life. In one of them there is the following passage, which may be taken as an abstract of his views on the proper position of women: "Women in the desert have their rights, which are respected, and they do not complain that they are ill-treated. It has not yet occurred to them that they should be placed on an equal footing with their husbands or their brothers. They are hard-worked and happy."

Let us hope that Lady Anne is *very* happy.—*Lippincott's for June.*

ALUM AS AN ADULTERANT OF BAKING-POWDERS.—Dr. Henry A. Mott, Jr., employed as chemist for the Indian Department, having made analyses of different baking-powders, publishes in the "Scientific American" as the result of his investigations, the statement that at least fifty per cent. of the many baking-powders examined by him were grossly adulterated. Dr. Mott found that the injurious powders are composed of alum and bicarbonate of soda, oftentimes containing false terra alba, insoluble phosphate of lime, etc. The best powders are composed of bitartrate of potash (cream of tartar), tartaric acid, carbonate of ammonia, and bicarbonate of soda, held together by a little starch to prevent decomposition. The injurious effects of alum on the digestive organs have been pointed out by chemists and eminent physicians: it produces dyspepsia, constipation, vomiting, griping; it is a powerful astringent, acting chemically on the tissues. Says Dumas, the French chemist: "It is to be feared that this salt (alum) exerts a deadly action by its daily introduction into the stomach, especially in persons of weak constitution." Liebig condemns the use of alum in bread-making on this ground among others, that it combines with the soluble phosphates, forming insoluble salts, and thus the phosphorus of the grain is lost to the system. Dr. Mott's paper exhibits as follows the results of the analyses of four brands of baking-powder:

DOOLEY'S STANDARD BAKING-POWDER.

Burnt alum	26.45 per cent.
Bicarbonate of soda	24.17 " "
Sesquicarbonate of ammonia	2.31 " "
Cream of tartar	None.
Starch	47.07 " "
	100.00

PATAPSCO BAKING-POWDER.

Burnt alum	20.03 per cent.
Bicarbonate of soda	22.80 " "
Cream of tartar	None.
Starch	57.17 " "
	100.00

CHARM BAKING-POWDER.

Burnt alum	30.06 per cent.
Bicarbonate of soda	21.82 " "
Cream of tartar	None.
Starch	38.12 " "
	100.00

BAKING-POWDER MANUFACTURED BY C. E. ANDREWS & CO., MILWAUKEE, WIS.

Burnt alum	22.53 per cent.
Bicarbonate of soda	21.79 " "
Cream of tartar	None.
Starch	55.68 " "
	100.00

RECENT LITERATURE.

Farm Implements and Farm Machinery: By J. J. THOMAS. New York: O. Judd Co.

THIS is a new, revised and enlarged edition of Mr. Thomas's well-known work. The new chapter on "recent machines" embodies mention of most of late improvements in farm machinery. One of the main objects of the work—to present in an intelligible and simple manner, the leading principles of mechanical science, applied directly in the farmer's daily routine, that he may know the reasons of success and failure—is clearly and sufficiently treated. The book is a valuable addition to a farmer's library.

USEFUL MISCELLANY.

PERIODICITY IN COMMERCIAL CRISES.—It may be accepted as pretty well determined that there is a periodicity of commercial and industrial crises; that they occur with singular regularity after a certain lapse of time. Prof. Stanley Jevons has found that in a period of 165 years a crisis took place every 11 years. Why crises thus occur is yet unknown. In Jevons's opinion neither wars, trades unions, excessive speculations, luxurious living or any other of the commonly assigned causes can be regarded as sufficient. Any physical explanation is yet merely speculative. In examining a problem of this kind it appears to be difficult for most writers to avoid confounding the *causa cognoscendi* with the *causa essendi*. Others, departing altogether from the semblance even of scientific method, lay the responsibility of a crisis on the shoulders of some class of persons who are really as unable of themselves to arrest, or occasion it as a mole to influence the inclination of the earth's axis. Most of the pseudo explanations can be readily exposed by showing that they do not take into account all the facts—that what may apparently suffice for what is local and national falls when applied over the whole area of a crisis. The periodicity of crises is yet an unsolved problem of physics and politics.

FEW persons familiar with old books have failed to observe dark specks here and there upon, or rather within, the substance of the paper, which, upon close examination, especially with a lens, are seen to have the same dendritic appearance that we find in moss agates, and upon the natural-fractured surface of other compact rocks. It is well known that such markings on the stone are generally produced by an oxide of manganese; and the similar markings upon the paper are doubtless due to the same cause. The following is suggested as an explanation: Bioxide of manganese is sometimes used in some of the processes of bleaching the pulp. Minute portions of the mineral would naturally remain in the manufactured paper, which by a slow reaction would be restored to an oxide again, in the process of which it would assume its characteristic dendritic form.

M. TENQUEM, a French artisan, has originated a method of writing on glass with common or India ink. The glass is heated over a spirit lamp, or gas, until steam ceases to be deposited on it that is to say, 50 deg. to 60 deg Cent; and a varnish, composed of eighty grammes of alcohol at 35 deg. four grammes of mastic in drops, and a gramme of gum sandarac heated together in a flask, is then applied to the glass, after the filtering of the varnish; the latter is very hard, and becomes brilliant and completely transparent, but, if applied cold to the surface of glass, it remains opaque and absorbs ink. A sheet of glass thus prepared may be written upon with ink, but must afterward be dipped in very thin gum water.

A GERMAN periodical is responsible for the following method of making malleable brass: Thirty-three parts of copper and twenty-five of zinc are alloyed, the copper being first put into the crucible, which is loosely covered. As soon as the copper is melted, zinc purified by sulphur is added. The alloy is then cast into moulding sand in the shape of bars, which, when still hot, will be found to be malleable and capable of being brought into any shape without showing cracks.

INDIA is said to possess a convenient tree, called the "kapas," which is used as a telegraph post. When cut down, its branches partially removed and stuck in the ground, it readily takes root, thus checking the ravages of the white ants and becoming a living telegraph post.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE "RURAL" HOUSEKEEPER'S TABLE.

I MIGHT also call it "The Woman's Friend" or "Treasure," or "Labor-saver," etc. etc., for I expect to receive the thanks of every American house-wife whose aching back and weary feet it shall rest.

It is designed for a "sitting-down" or "standing-up" work-table combined. A, shows the top of the table which may be made with a drop leaf in the ordinary way, which would be desirable in small rooms, to save space when not in use; but where the room is large I should prefer to have the top made solid and substantial for ironing and kneading, supporting the front part with strong brackets as shown in the cut. Under the back part of the table and made solid therewith, is a rectangular box B, which rests upon the floor when using the table in a sitting position. Its hight should then be 24 or 26 inches. This box is to be divided into drawers and compartments for holding flour, spices and other articles, including the utensils usually required in household work.

Fastened securely against the wall are a couple of strong uprights, C, C. These are rabbeted on their inner edges. Fastened to the back of the box B, are corresponding pieces which slide up and down in the uprights, C, C. Therefore, when it is desired to use the table while the person is in a standing position, the whole by means of the lever D, and connecting rod E (fastened to the back of the table), may be raised to any desired hight, and held there by pins in the uprights, or by placing a block of the proper thickness under the box. Any handy carpenter could construct such an arrangement as this at slight expense, and many a handy farmer could do it likewise. The invention is not patented, and, like my other devices and plans, I present it as a free gift to the "RURAL" readers. WM. ROBT. BROOKS.

Ontario Co., N. Y.

WASTE OF TIME IN COOKERY.

MRS. MARY G. RAND.

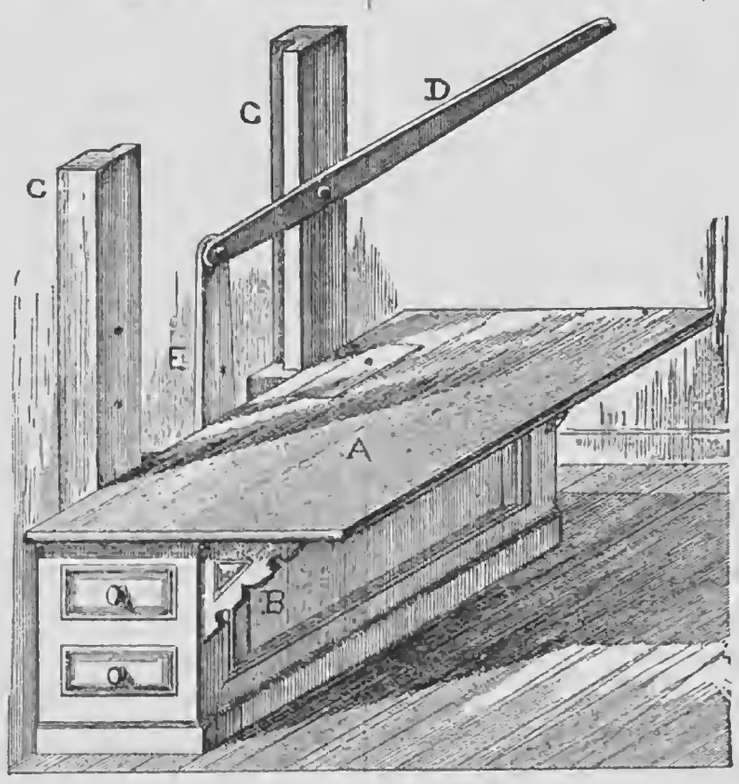
THE housekeeper who devotes a portion of her time each day to the preparation of healthful food for her family—or to seeing that it is done, is not wasting time, neither is she doing anything beneath her dignity. Many ladies have the false idea that domestic labor in any form is incompatible with refinement and intellectual culture. It is far from being discreditable to a lady to act in accordance with her responsibility for the health of the household, by furnishing the table with palatable, well-cooked food. To do so may oblige her to attend personally to the cookery if the domestic cannot be trusted in that line, but the *work* that adds to the comfort of the family, ought not to be regarded as *drudgery*. The family that lives, as too many do, on sour, heavy bread, *fried* meats, badly cooked vegetables, and pastry, can hardly expect to keep in health. The man who eats such food day after day, cannot have physical strength equal to the requirements of his business. The children may, on account of youthful vigor, escape for a time the bad results of habitually eating unwholesome food. All housekeepers do not realize the importance of having good yeast bread for every meal. It is indeed, "The Staff of Life," as would be proved to any one who might be deprived of it for a single week.

Many who have large families to work for, imagine that they cannot spare the time to make bread as it ought to be made. It is true that even with the best of flour and yeast, considerable management and work too, are necessary to insure good home-made bread. Whether the family be large or small, the housekeeper should try to have bread of the best quality always upon the table. She can get the time for bread making, if she will make fewer cakes and pies.

Pie making, as it is carried on in most families, leads to a great waste of time, and as even the plainest pies are unhealthful, nothing can be said in their favor. An excellent writer on Domestic Economy says: "If the laws of health were obeyed, pastry would be banished from every table, for it combines the three evils of animal fat, cooked animal fat, and heavy bread." Comparatively few persons are inclined to believe that fresh, ripe fruits as a dessert, are superior to fruits cooked between layers of paste, in the form of pie. If pie be eaten at all, it should be as the *exception*—not as the *rule*. By the exercise of a little ingenuity, the housewife can prepare a variety of simple dishes for dessert, so excellent that pie will scarcely be missed from the "bill-of-fare." Many puddings are not unhealthful, unless eaten with sauces that are highly seasoned with spices and wine.

A great deal of time is wasted in cake making; for example: sponge cake, some of the recipes for which, call for an hour to prepare for the oven. The cake that is beaten so long, has nothing substantial about it, and will disappear from the table in a fourth of the time required to make it. For some occasions, one may feel justified in giving extra time and work to ornamental cookery. For ordinary use, dishes that are prepared to please the fancy, amount to very little, but involve a great deal of trouble, and a great waste of time.

Lyons, Iowa.



"RURAL" HOUSEKEEPER'S TABLE.

STAINING WOOD.

Mahogany.

To give pine the appearance of mahogany, brush over two or three times, allowing the wood to dry between each application, with a boiling decoction of logwood chips. When thoroughly dry give two coats of shellac varnish, after which carefully sandpaper, polish, and give a final coat of varnish.

Ebony.

Any compact wood coated three or four times with the boiling decoction, as above, and then washed with a solution of acetate of iron, made by dissolving iron filings in vinegar, will be stained in very good imitation of ebony, the wash penetrating so deep that ordinary scratching and chipping do not show the original color.

Black Walnut.

Put pulverized asphaltum into a bowl with about twice its bulk of turpentine and set where it is warm, shaking from time to time until dissolved; then strain and apply with either a cloth or stiff brush. Try a little first and if the stain be too dark thin it with turpentine. If desirable to bring out the grain still more, give a coat of boiled oil and turpentine. When the wood is thoroughly dry, polish with a mixture of two parts shellac varnish and one part boiled oil. Apply by putting a few drops at a time on a cloth and rubbing briskly over the wood.

Maple.

Grayish maple may be whitened by washing it with a solution of oxalic acid, to which a few drops of nitric acid have been added.

Graining.

Beautiful artificial graining may be given to many kinds of wood by tastefully tracing with a camel-hair pencil in raw oil, so as to resemble the rich varying veins of the more rare and expensive woods. The veining should be gone over two or three times, while the rest of the wood need be coated but once with oil thinned with turpentine. MARY B.

NOTES.

Drink cayenne pepper tea for a cold.

May-weed blossoms put into alcohol make a superior liniment.

In cases of ivy poisoning, bathe the parts with sweet spirits of niter.

For burns, bind on moistened baking soda. It will give prompt and permanent relief.

Rub sprains, bruises or lameness with a paste made of salt and the white of an egg.

DOMESTIC RECIPES.

Pineapple Wine.

When making pineapple preserves, or canning them, save the outside which has been cut off, and to every two quarts of peelings allow four quarts of water and three pounds of white sugar. Bring the sugar and water to the boiling point and pour over the peelings. When cold, add to the above quantity the juice of a good-sized lemon and a tablespoonful of yeast. Let stand three or four days in a small tub or crock, covered with a cloth, to ferment. Then strain, put into a cask, and to each gallon of the wine put in a pound of raisins cut in half and a small piece of isinglass. It will answer to bottle in six months.

MRS. CLAYTON.

Potato Cakes.

Work cold mashed potatoes soft with a little melted butter and milk; add enough prepared flour to roll it out half an inch thick, cut into rounds with a biscuit cutter and bake in a quick oven to a nice brown. Rub a little butter over each just before they are done.

Beet Greens.

Pull when young, wash and look over very carefully but do not separate the tops from the roots. Put into a kettle which is half full of boiling salted water and boil from half to three-quarters of an hour; take out and drain in a colander, pressing down with a spoon so as to get out all of the water. Dish and pour over a dressing of vinegar, butter, pepper, and salt. MRS. E. J. G.

Livingston Co.

Broiled Ham.

Cut in thin slices and place in cold water to soak over night. In the morning turn off the water, put into a sauce-pan and pour over boiling water. Set on the back of the stove where it will keep hot without boiling. When all other preparations for the meal are made, take out the slices, wipe dry and broil on a wire broiler over a clear fire. Turn and tend as carefully as you would toast bread. E. M.

Short-Cakes.

In answer to an inquiry I will give my mother's recipe for short-cakes, knowing it to be very good: One pound of sifted flour, one-fourth pound of butter and half as much lard; a little salt; soda as large as a pea, dissolved in half a teaspoonful of vinegar. Mix well together with ice-cold water to a stiff dough. Roll half an inch thick, cut into round cakes, prick with a fork and bake in a quick oven. MRS. KATE BRADY.

QUESTIONS ANSWERED.

Aquarium Cement.

Mrs. A. L. Price asks for a cement that will securely fasten the glass of an aquarium into its frame.

ANS.—Take of Plaster-of-Paris, fine, white, dry sand and litharge each one gill, and powdered resin one-third gill; mix thoroughly and make into a paste with boiled linseed oil to which dryer has been added. Beat well together and apply after it has stood four or five hours—no longer, for it will lose its strength.

Repairing Cracks in Ironware.

L. W. S., Chenango Co., N. Y., asks whether there is anything that will stop a crack in a chaldron kettle, so as to prevent it from leaking when in use.

ANS.—Take of sal-ammoniac two ounces; of sublimed sulphur one ounce; cast-iron filings, one pound. Mix in a mortar and keep the powder dry. When it is to be used, mix with it twenty times its weight of iron-filings, grind in a mortar and wet it with water until it becomes of convenient consistency to apply. It will become in time as hard and strong as any part of the metal.

News of the Week.

MISCELLANEOUS.

Monday, June 2, 1879.

President Hayes sent in his veto of the legislatives appropriation bill on Thursday, reproving Congress for continuing in the habit of tacking political riders to appropriation bills, and joining issue on the policy of weakening in any way the federal safeguards of the ballot. He explains how much the democratic proposition would repeal and goes on to demonstrate that the general government is under clear constitutional obligations to secure the integrity and freedom of elections, where members of Congress are chosen. This veto is the most important of all so far, touching, as it does, the real question at issue, to which those on the army bill were merely preliminary. The Ohio republicans nominated Charles Foster, Wednesday, for governor on the first ballot and Gen. Andrew Hickenlooper of Cincinnati for lieutenant-governor. W. P. Healy and Thomas Harland, the lawyers who ran away with the books of the New York mining company from Marquette, Mich., while the Tilden income case was on trial, have each been fined $200 at Detroit.

The will of Judge Packer the famous coal baron of Pennsylvania, bequeaths for the permanent endowmedt of Lehigh University, Bethlehem, Pa., $1,500,000; for a library for the University, $500,000; to St. Luke's hospital, Bethlehem, $300,000; and St. Mark's Episcopal church, Mauch Chunk, Pa., $30,000. There are several bequests which are kept private for the present. More than 6000 people have left the province of Ontario in the past two months for Manitoba, and there have passed through Hamilton, Ont., 1300 emigrants from Europe, 1000 from the province of Quebec, and 500 from other Canadian provinces, making a total of over 8700 persons who have entered Manitoba within the last 60 days. A Boston emigration company, headed by a number of leading citizens, has purchased 60,000 acres of land in Tennessee, on the Cincinnati Southern railroad, 40 miles from the Kentucky line, and will lay out a city and populate it and its surroundings with Massachusetts colonization. The New York produce exchange has adopted the "cental" system, and the board of managers will now ask the different trades to adopt the system for general use. The fact is admitted all around that immigration to Texas, if not coming to an abrupt close, is greatly on the wane. Immigration agents of the railroads are all discouraged. Real estate in Texas has depreciated in value the last two years fully 8 per cent.

Congress is apparently getting ready to adjourn, but the democrats have been waiting for the veto of the legislative bill, which the president sent to the House Wednesday, before reaching a final decision. The House committee on ways and means have already agreed on June 11 as the date of adjournment, and the probabilities seem to be that the appropriations for the army and the executive departments will be extended to Jan 1, with the proviso that none of the money shall be used to pay marshalls and supervisors nor to transport troops to the polls. The inhuman treatmene to which animals are subjected by railroad companies transporting them from the West to the sea-board was the theme of a very able speech by W. M. McPherson of New Jersey in the Senate on Monday. As he has had long experience as a cattle-dealer he was able to speak from personal observation of the cruel and barbarous treatment of animals, the details of which were extremely revolting. The Senate was aroused over the question, but has postponed its further consideration until next December.

The House finally passed the Warner silver bill on Saturday morning, after an all-night session, the republicans filibustering to secure a vote on a substitute for the bill proposed by Mr. Ryan of Kansas. The democrats finally gave in, voted down the substitute and adopted the bill itself, 114 yeas to 97 nays; 15 republicans and greenbackers voted yes, and nine democrats and greenbackers, no. It is charged that the democrats merely passed the bill for political effect, hoping that it would give them the greenback vote in the coming Ohio election, for if the bill should pass the Senate the President would veto it. The bill fixes the weight of the standard silver dollar at 412½ grains; authorizes the owner of silver bullion to deposit the same at any mint to be formed into bars or standard dollars; makes the charges for coining such bullion the difference between its market value in New York and the legal-tender value of the coin; makes subsidiary silver coin exchangeable at the treasury for legal-tender money to the amount of $20; makes the standard silver dollar legal-tender in all payments at their nominal value; requires the treasury to pay out silver coin without discrimination, the same as gold coin, in liquidation of all kinds of coin obligations against the government; authorizes the issue of certificates to depositors of gold or silver coin or bullion; also authorizes the issue of certificates (representing coin in the treasury) in payment of interest on the public debt, both classes of certificates to be receivable in payment of duties on imports. The certificates for bullion deposited are to be for its average market value in coin of like metal, during the proceeding week in New York and San Francisco. The gold and silver bullion deposited is to be coined to the full capacity of the mints (in connection with other coinage) and if the bullion deposited for coinage does not amount to $2,000,000 per month, the treasury is to purchase sufficient silver bullion to coin that amount.

FOREIGN.

The most interesting piece of recent news from France is the programme of the extreme Radicals as produced by Dr. Clemenceau, who is universally looked on now as the ablest man of that faction, and the man most rapidly rising into power and prominence, and the one most likely to take Gambetta's place, in case the latter as he grows older should become too conservative. In a speech to a large meeting of his constituents of the eighteenth arrondissement, in Paris, he denounced the Senate as a fifth wheel to the coach; demanded more liberty for the press; advocated the conscription of theological students for service in the army; direct instead of indirect taxation; free-trade; a change in the officials of the Ministries of Justice, Finance, and Foreign Affairs; complete amnesty; the pardon of Blanqui. He further reprobated the Ferry bills about education on the ground that the existing laws, if properly enforced, would do the work more efficaciously. He also demanded fair play

between the clergy and the infidels, for, said he, "The Catholics have the right of insulting you in their pulpits, their congresses, and their newspapers, while any one who attempts to reply to them comes into collision with the law for the protection of religious morality."

An International Congress of eminent engineers lately sat in Paris under the presidency of M. Lesseps, builder of the Suez Canal, to discuss the ways and means of carrying out the greatest engineering enterprise yet projected—the piercing of the Isthmus between the Atlantic and Pacific Oceans by a ship canal. The scheme has occupied men's minds in a greater or less degree ever since the Spanish conquest, and the first survey for it was made as long ago as 1829, and all that is necessary for comparison of the merits of the seven or eight rival lines has now been done, and the result is before the Commission. All of them involve either a system of gigantic locks or of gigantic tunnels, but the choice of the Commission lay chiefly between the Nicaragua, or American route, and the Panama-Aspinwall, or French route, one to cost $180,000,000 and the other $240,000,000; and the last has been selected, not a little to the disgust of our folks, and will take twelve years for completion, and probably a great part of that time before money enough can be raised to make an effective beginning. The committee on ways and means are opposed to government assistance of the enterprise, and propose a transit duty of $3 per ton, at which rate it is estimated that the gross receipts of the canal will reach $18,000,000 a year. The commerce committee of the congress consider this rate too high.

Lord Chelmsford, the British soldier whom the disaster at Isandula and his indifferent success in South Africa, since has made so unpopular, has at last been superseded by Sir Garnet Wolseley, who is appointed supreme military and civil commander of Natal, the Transvaal and other districts that adjoin and are included in the seat of war, Sir Bartle Frere remains governor of Cape Colony, and Beaconsfield was kind enough to announce in the House of Lords last evening that, though Wolseley would not be immediately deprived of the latter's services. Gen Grant leaves Yokohama, Japan, the last of June and will reach San Francisco about July 20.

The British have gained every political and commercial advantage for which they entered upon the Afghan war, in a treaty signed at Gundamuck this day week by the Ameer and Major Cavagnari. The British are assigned the Kuram, Sibi and Pishin valleys, giving them control of the mountain passes leading from India, and will hand the surplus revenues over to the Ameer, who is guaranteed a yearly subsidy of $300,000. The British will remain at Candahar till fall and will appoint a resident at Cabul, to which point a telegraph is to be established. The British resident is to have an escort for agents sent to the Afghan frontier on special occasions; the Ameer is guaranteed against foreign aggression; British sympathizers in Afghanistan are to be amnestied and there is to be peace and friendship hereafter between the contracting parties. The competitors in the match for the walking championship of the world, to take place at London, England, June 16, have been reduced to Rowell, Ennis, Brown and Harding of Blackwall. The list will be open until Friday, to give Weston an opportunity to enter.

VARIOUS.

CHURCH PROPERTY IN NEW YORK STATE.—What the freedom of the Church from entangling alliance with the State can effect is shown in the religious condition of the State of New York, according to the official census for 1875. There are 6,320 organizations in the entire commonwealth, and 6,243 church edifices; the sittings number 2,537,470, and the church-members 1,177,470. The churches, with the ground on which they stand, are valued at $101,105,765; the sum of $15,308,231 is paid annually in salaries to the clergy. All these are free gifts of the people. In sittings the leading denominations rank in the following order: Methodists, 700,678; Presbyterians, 372,662; Baptists, 351,308; Protestant Episcopalians, 226,062; Reformed Dutch, 109,815; Congregationalists, 107,847 Lutheran; 77,731. In communicants these same denominations rank as follows: Methodists, 198,900; Baptists, 109,972; Presbyterians, 123,698; Protestant Episcopalians, 78,515; Congregationalists, 30,922, Reformed Dutch, 35,397; Lutherans, 34,439.

Rose Eytinge, the actress, is of partly Jewish descent. The Boston Herald's correspondent says that, while she was lounging in the Union Square Theatre green-room between a matinee and an evening performance, an actor entered just in time to see her yawn. Gazing in affected horror at her widely-opened mouth, he exclaimed, "Oh, don't swallow me." "You are safe," she retorted; "I am enough a Jewess to abhor pork."

Other odorous waters undergo many variations of aroma as they fade into insipidity, but MURRAY & LANMAN'S FLORIDA WATER passes through no such gradations. As it is when sprinkled upon the handkerchief or the garment, so it remains—delicate, refreshing, and delightful to the last.

Clergymen, Lawyers, Editors, Bankers and Ladies need Hop Bitters daily for nerve force.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 31st, 1879.

BEANS AND PEAS.—Trade in beans has been very moderate; prices for both mediums and marrows have an easy tone. Still, extra solid, well-cured stock, that will be safe holding in the coming hot weather, are held above the annexed rates. Other sorts of beans quiet at former figures. Green peas steady at $1.80@1.85; Canadian field, in bulk and bond, 75@76c. B. E. peas, per 2 bush. bag, $2.50. Beans, marrows, prime, $1.37½; fair to good, $1.25@1.35; mediums, prime, $1.30@1.32½; fair to good, $1.20@1.25; white kidney, $1.30@1.50; do., red, $3@3.10; black or turtle soup, $2.15.

Receipts of beans for week, 5,172 bush.; exports, 638 pkgs.

BROOM CORN.—Supplies are full of other straw brush and prices easy.

Brush and short broom, choice, per lb., 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—With receipts of 37,000 pkgs. for the week, and hot weather restricting sales, the butter market is not in a strong shape. Quality, however, shows a marked improvement, and with the known wants of Europe and the enlarged local trade that will arise through cheap rates, a perplexing surplus is not at present feared. Exporters have paid full quoted rates, but decline to operate unless allowed a better margin. When settled hot weather comes, butter cannot be shipped as ordinary freight, and cold room adds expense to purchase for foreign use. Over-salting is considerably complained of through the market, particularly in Western invoices. State pails and half tubs, choice, 15c.; good to prime, 13½@14c.; fair to good, 12@13c.; Welsh tubs, choice, 14@14½c.; good to prime, 13@14c.; fair to good, 12@13c.; poor, 9@10c; State creamery, best invoices, 17@18c.; good to prime, 16@17c. sweet cream, best, 16½@17c.; fair to good 15@16c.; Western, best invoices, 18c.; good to prime, 16@17c., fair to good, 15@16c.; imitation creamery, 13@15½c.; Western dairy, best invoices, 13@14c.; good to prime, 12@13c; fair to good, 10@12c.; poor to fair, 9@10c.; Western, factory, best invoices, 13c.; good to prime, 10@11½c.; fair to good, 9@10c.; poor to fair, 8@9c.; grease butter, 3@4c. Exports for week nearly equal 10,000 firkins.

CHEESE.—The market has tended rather easier this week. The shippers have tame advices, and have not been willing to operate freely except at concessions. Receivers have been forced to yield a little since receipts are larger and the weather against holding of stocks.

Prices are: New factory—7¾@8c. for best; 7@7½c. for good; 3½@5½c. for half skimmed, and 2@3c. for skimmed; dairy at 6@7½c. for good and fine; 5@6c. for fair to good, and 6@3 c. for skimmed: Western factory at 7@7½c. for fine; 4@5½c. for half skimmed, and 3@3c. for skimmed and for old as follows: 6@6c. for good, down to 2@3c.

Liverpool quotation for new, 41s.; do. old, 42s.

Steam, 32s. 6d.

COTTON.—The market has fluctuated sharply and has been active, closing strong at for June, 12.90@12.91c.; July, 13.10@13.11c.; August, 13.26@13.27c.; September, 12.97c.; October, 11.97@11.98c.; November, 11.48@11.49c.; December, 11.37@11.39c.; January, 11 38@11.40c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	*N. Orleans.*	*Texas.*
Ordinary	11 9-16	11 11-16	11 11-16

Good ordinary	11¾	Low Middling	12 7-16
Strict good ordinary	12¾	Middling	12 13-16

DRIED FRUITS.—In apples evaporated stock is having a very good inquiry, and rules steady in prices, but beyond this the market is lifeless, and nominal.

Apples—evaporated Alden's & William's 10¾@10¾c.; do. new process at 8½@9c. State plums, 12@12½c.; Blackberries quoted at 4¾c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2¾@3c. Pitted cherries, 20c. Apples—New, 2¾@2¾c. for Southern quarters in bags; 3¾@4c. for prime sliced; do., fair and good, 3½@3½c.; State at 3@4c. for new sliced; and 3@4c. for quarters; Western at 3@4c. for new quarters. Raspberries, 30c.

EGGS.—Receipts for week, 13,000 bbls. The market is in a better selling condition than it has been for some time past. "Loss off" is not generally accorded, but most dealers in Western make "something good."

Near points, ₱ dozen, single bbls., 14c.; State and Penn., 14@13½c.; Western, fresh, 12@13c.; do., Canada, 12½@13c.; Western and Southern, inferior, 11½@12c.

FLOUR.—Receipts have been large and freely offered at lower prices, with some pressure to sell prompted by lower wheat values.

Latest prices are: $3.25@3.80 for inferior to very choice superfine State; $3.65@3.90 for poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do.; $3.25@3.85 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.60@3.90 for inferior to good shipping extra do., and $3.90@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.25@5.40; choice to very fancy do. at $5.40@5.75; red and amber winter wheat, inferior to very choice trade and family, at $4.25@5.00; round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.40@5.25, the latter rate for strictly fancy; St. Louis, $4.30@5.50 for inferior to good extra; $5.50@6.35 for good to very choice (with very fancy brands up to $6.75); Minnesota clear, very inferior to very choice, at $3.65@4.85; Minnesota "straight," a few fancy as high as $5@5.25, and patent poor to strictly fancy at $5.30@5.75, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $4.85@5.20 for West Indies (the latter rate for fancy in new packages); do. for England and $5.65@6.10; do. trade and family extras, $5.25@6.25; do. for South America, $5 for standard brands (winter wheat product); No. 2 at $2.30@3.25 for very poor to strictly fancy.

FRESH FRUITS.—Russet apples running out at $1.50@2.50 per bbl. The export demand was remarkable last season. Shipments from Jan. 1st add up 89,100 bbls. against 14,850 for corresponding period '78. Strawberries are in full supply. Quotations at the close are specially cheap, owing to the break in regular trade by the holiday of decoration. Md. and Del., 5@10c. per quart. Norfolk, 3@8c. South New Jersey will ship next week. Georgia peaches small, but in fair order, $2 50 per ½ bush. crate. Norfolk gooseberries, frese, $1.50@1.75. Southern cherries, 3@7c. Hothouse peaches, per doz., $5@6. B. Hamburg grapes, $1@1.25. Peanuts are tending lower, with stock going into store. Hand-picked Virginia, $1.35@1.40; other grades, $1.10@1.25; shelled, 5½@5½c.

GRAIN.—Wheat has tended lower on larger supplies and easier foreign advices.

Latest sales are of No. 2 spring at $1.03@1.06; No. 3 spring at 91@93c.; rejected spring at 73@73½c.; ungraded amber at $1.13@1.15; ungraded red at $1.11@1.14; White State at $1.15; No. 1 white at $1.13½@1.14; ungraded white at $1.12@1.13½; No. 1 red at $1.16@1.16½; No. 2 red at $1.15½@1.16; do. steamer grade at $1.14; ungraded red at $1.11@1.14; New York No. 2, May option, at $1.03¼; do., June, at $1 03; do., July, at $1.03; No. 2 northwest spring, June, at $1.01; No. 1 white, June, at $1.13¾@1.14; do., July, at $1.13¼; No. 2, May option, at $1.15@1.16¼; do., June, at $1.15¾@1.15¼; do., July, at $1.15; do., August, at $1.11@1.11¼. Rye at 62@62c. for Western and 63@64¼c. for State. Corn has been active at a decline; latest sales are of New York No. 2 at 43¾@44¼c.; steamer mixed at 43@43½c.; ungraded Western mixed at 42@44c.; New York No. 2 white at 51¼c.; New York steamer yellow at 45@45¾c.; white Southern at 53½@55c.; New York low mixed at 47@48c.; New York No. 2, May, at 43¼c.; New York No. 2, June, at 43¾c.; do., July, at 43¼c.; do., August, at 46c.; steamer mixed, May, at 43¼@43¾c.; steamer mixed, June, at 48c.; do., July, at 43@43¾c. Oats are having a good sale and they rule at strong prices; latest sales are of New York No. 2 white at 38@38½c.. New York No. 1 white at 40¾@41c.; New York No. 3 white at 37½c.; New York No. No. 1 at 36c. New York No. 2 at 35¾@35¾c.; do., June at 35¾c.; white Western at 37@37c9; mixed Western 35@36c.; New York No. 3 at 24¾@31¾c; white State at 40@44c.; mixed do. at 36c.; No. Chicago afloat at 35¾c.

HAY AND STRAW.—There are freer supplies and prices easy, especially for the better grades.

Sales at 45@50c. for shipping, and 75@85c. for real qualities. Straw at 45@50c. for long rye; 40c. for short rye, and oat at 30@40c.

HOPS.—There is a good sale to brewers, but export demand continues slack. Prices are steady and unchanged.

Quotations are for New York's, new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 3@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@10.

MAPLE SUGAR.—The season is about over; the remnant will meet only a chance sale; quoted, 7@9c. for cakes; 75c. for sirup in tin.

OIL CAKE.—Western is scarce and wanted; quoted at $28 per ton.

POULTRY AND GAME.—Arrivals of fowls have suddenly increased and they have as promptly declined. Chickens are abundant, the best sell quickly at $1; but small are slow at 40@50c. ₱ pair; by the pound, 25@35c. is quoted.

Fowls, N. J., 10¾@11c.; Western, 10c.; Southern, 9½@10c.; roosters, old, 6c.; turkeys, Western, 10@11c; ducks, Jersey, N. Y. and Pa., ₱ pair, 60@75c.; Western and Southern, 45@55c. Geese, Jersey, $1.25@1.50; N. Y. and Pa., $1.25@1.50; Western, 75c.@$1; Southern, 75c.@87c.; pigeons, 40c.

Dressed is almost nominal for public market purposes.

Turkeys, prime, small, 15@17c; fair to good large, 13@14c.; chickens, spring, dry-picked, 45@50c.; fowls, Jersey, choice, per lb., 13@14c.; State and Western, prime, 12@13c.; fair to good, 10@12c.; Phila. dry-picked, 13@15c.

A few ice-house English snipe and plover left which are selling slowly at weak prices. Dowitch, curlew and bay birds generally are dull in mixed lots and weak in price. Sand snipe and Ox Eye very dull. Wild pigeons not very plenty, but in slack demand and unchanged in prices. Wild squabs from Missouri sold at quotation.

Eng. Snipe, doz., $2 25; plover, $1 75@2; Dowitch, $1 50; small and sand, 50c.; Ox Eye, 10@12c.; baited pigeons, $1.75@2; flight, Nothern, $1.37@1.50; Mo. flight, $1; squabs, Mo. flight, 75c.@$1; tame, $2 2 @2 50, which is lower.

PROVISIONS.—There has been a fair amount of business and prices generally closed strong. Mess pork quoted at for May, $9.90 bid and 9.95 asked; June, $9.95 bid and $10 asked; July at $10 bid and $10.10 asked, and August at $10.10 bid and $10.20 asked. Bacon at $4.42½ for long clear and 5.05 for short clear. Lard—Western steam, at $6.30@6.32½ for spot, and June; $6.37½@6.40 for July, and $6.42½@6.45 for August delivery. Stearine at 6¾@6¾c. for Western. Tallow at 6¾c. for prime. Beef hams at $17.50@17.75. Beef—Extra India mess, $20@22, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEED GRASS—Are dull; clover quoted at 6½@6¾c. for prime and choice, and timothy at $1.45@1.50.

TOBACCO—The market has been without much activity the past week, the business in small lots, but prices have been well sustained and show no important change.

WOOL.—The sharp competition for supplies has continued the past week, and buyers have been willing to meet almost any reasonable price—the struggle to secure supplies being based upon the marked improvement in trade in the goods market. Much interest is given the marketing of the new clips, and all early arrivals it is probable will find a market at swing figures, since the stocks in manufacturers hands have run down, and they will also come upon market almost bare of desirable lots. XX Ohio fleeces have sold up to 37½c.; spring California at 18@24c.; spring Texas at 20@25c.

LIVE STOCK MARKETS

NEW YORK, Saturday, May 31st.

BEEVES.—Receipts for the week, 11,458 head; do., last week, 11,069 do. Unusually warm weather for the season has curtailed butchers' wants quite early. With heavy supplies prices are lower compared with Wednesday last. Exports very heavy this week; comprising 6,444 quarters beef and 301 live cattle. Among the offerings were upwards of 40 car-loads of stillers, mainly Cherokee, Texas and Colorado steers. The native cattle and fair to good Texans, Cherokees went off slowly at a reduction from Wednesday equal to about ½c. ₱ lb., but the light Texas and Cherokee stock could not be sold except at a ruinous loss, and the greater part remained unsold when the market closed. Four car-loads of light Cherokee cattle, about 900 lbs average, were sold at 6¾@7c. ₱ lb. to dress 55 lbs; otherwise the extreme range was 7½@9 c. ₱ lb., to dress 55@56 lbs. Bulk of transactions at 8@8c. ₱ lb.

The World says: "The difficulty in respect to unloading live cattle at Liverpool has been overcome and exporters are hopeful of finding a chance of profit in shipping live cattle and sheep to Great Britain for the next three months. Time will tell the story."

COWS AND CALVES.—There are no transactions upon which prices for good milk stock can be based.

VEAL CALVES—Dull and lower; milk calves, 4@5¾c. fair to best, the extreme for N. J.; State, choice, not over 5¾c. Buttermilk calves, 3½@3¾c.

SHEEP AND LAMBS.—Receipts for week, 27,638 head; do. last week, 23,966 do. Sheep lower for the week. Lambs barely steady. Decent to good sheep sold at $3.80@4.30 ₱ 100 lbs.; better stock at 4½@5c., and two car-loads of choice, for exportation, reached 5¾@5¾c.—outside figure for extra wethers, 124 lbs. average. Southern and Western lambs ranged from $6.20 to $8 ₱ 100 lbs.; Jersey do., from $8.25 to $9.

HOGS.—Receipts for week, 29,891 head; do last week, 31,751 do. Good corn hogs quoted nominally, $4 ₱ 100. No sales. City dressed State hogs, heavy, to pigs, 4½@6c.; Western, 4¾@5½c.

HORSFORD'S
Bread
Preparation

UNSURPASSED FOR MAKING

LIGHT BREAD,

Biscuit, Rolls, Cake and Pastry.

It is Better and Healthier than ordinary Baking Powder, Cream Tartar or Yeast.

The cost of raising Bread, Biscuit, &c., with it is only about half as much as by ordinary Baking Powder, and the result is much better.

It restores the nutritious elements which are taken from the flour in bulting. No ordinary Baking Powder or anything else used for raising bread does this.

Universally used and recommended by prominent Physicians.

If you cannot get it of your Grocer send a three-cent stamp to the manufacturers for a sample.

Manufactured according to the directions of Prof E. N. Horsford, by the Rumford Chemical Works Providence R. I.

1879. BONE. BLOOD. MEAT.

1879. No Rock Phosphate Used.

The large and extensive Works of the BUFFALO FERTILIZER, destroyed by fire in July last, have been entirely rebuilt and supplied with new and improved machinery.

It is the leading Fertilizer now in use by the farmers of the States of New York, Ohio, Pennsylvania and Vermont, and the Canadian Provinces.

This Fertilizer is guaranteed for its purity, being manufactured entirely from ANIMAL MATTER. No rock or mineral phosphate or refuse acid from oil refineries enter into its manufacture.

It is a mistake to suppose that any department of a paper may be slighted. The most important information is to be found, at times, under the guise of an advertisement; and it is agreeable to the advertiser and a courtesy to the publisher to mention the source of your information—in other words, to mention the paper.

Reading for the Young.

THE HORTICULTURAL CLUB.

UNCLE MARK.

THE members of the Club have lately manifested great interest in their plants and gardens, as shown by the letters I have received from all quarters. All report that they are doing their very best, preparing their gardens, sowing their seed, and setting out their plants most carefully. I trust that the warm weather and swarms of musquitoes that are now coming on will not affect their zeal unfavorably, for of all seasons this is the one when the garden must have attention. Next to seeding and planting there is nothing more important in gardening, than culture. The weeds must be killed, the ground loosened, the plants receive stakes and be tied up, or otherwise attended to. Below I will give a few brief directions for the treatment of such plants as you are most likely to have in your gardens and begin with

Musk Melons

as every boy and girl is sure to relish this delicious fruit, and therefore quite apt to have a few plants under cultivation. To protect the plants from their insect enemies, dust them with wood ashes and plaster. If you wish to grow very large and fine melons, allow only two plants to each hill, four by four feet apart. Water them with liquid manure made by stirring half a pound of rich guano in a pail of water; (pulverized hen manure will do as well,) and lead the vines out where they will have room to grow without being entangled with each other. When the melons are as large as a tea-cup, pinch off the ends of all the vines, to lead the strength to the fruit, and cut off all but five melons to each plant. This depends, however, upon the size of the variety; if the fruit is naturally small, more can be grown on a strong plant, if very large only three or four should be left. You will notice that there are two kinds of flowers on your melons, as there also are on cucumbers, pumpkins, and all plants of the same family. One kind has a knot or large swelling just below the flower; this is the ovary or young fruit, and the flower is called a *pistillate* or female flower. The other kind is smaller, generally appear first and has no swelling below it, this is the *staminate* or male flower, and before the fruit can develop, some of the *pollen* or fine dust from the flowers must be brought in contact with the organs in the pistillate flower. This is generally done by insects, but to be sure that your first fruit-flowers are fertilized, so that you can get ripe fruit as early as possible, you can transfer some of this pollen yourselves, with a camel's hair brush. When the pollen is taken from other varieties it is called *cross-fertilization*. Melons are a so common fruit with us that there is danger we do not appreciate them as highly as we ought to.

In England and in middle and northern Europe, where melons can be grown only on hot-beds, they are considered a great delicacy, and can be had only by rich people, who can afford to keep trained gardeners who know how to grow them.

Much more might be said on this subject, but I have already given it too much space, and will, therefore, go on with

The Strawberry,

which is of no less importance. Every one of our members should have a small bed of strawberries, if possible; they are so healthy, so delicate and so easy to cultivate. Beds can be planted at any time during the summer, but it is commonly done in the spring or in the early fall when the runners have gained sufficient strength to be set out.

At present keep the weeds down between your plants with the hoe, and if you do not wish to increase your stock, cut off the runners as they appear. Spread some grass around the plants as soon as the fruit is formed, to keep it clean. Plants that were set out in the spring should not be allowed to bear any fruit this summer. Pick off both flowers and runners; they will bear the better next year. Choice new varieties which you want to propagate may be allowed to send out runners, but cut these off above the *first joint* as soon as the young plant has taken root, and assist it in doing so by placing a small lump on the vine to keep it in place. You will thus get fine young plants, which can be set out next August. There are both white and green strawberries when ripe, but red, as you know, are the most common.

If you have any

Raspberries,

the canes must be tied to the trellis or stakes. The young shoots that are now coming will be next year's bearing canes and should be taken care of; five or six may be left on each strong plant, the rest are superfluous.

Tomato Plants

should never be allowed to lie on the ground, they give less and inferior fruit and it will ripen late if they do. The best way is to train them to a trellis made either of wire or of wooden strips. Every branch should be tied up, and later, when a quantity of fruit is formed, the tips pinched off; you will then be surprised to see the amount and size of the fruit you can gather from a single plant. In lieu of a trellis, you can use low, spreading brush to raise the plants from the ground, but it is not so efficient.

Peas

growing over a foot in height should be supplied with brush on which to climb. Trim each brush with a hatchet into a flattened or fan-shaped form, sharpen the ends so they can easily be stuck in the ground and set a row of brush to each row of peas. In beds of two rows the brush should be set on the outside, the tops leaning a little toward each other.

Radishes

should now be freely supplied with water, otherwise they will be spongy and unfit to eat. To have a constant supply of this excellent vegetable, sow a short row every week, say every Saturday. They can be grown between the rows of cabbage and other vegetables, but *water them freely.*

Some of the members have told us of their success in growing

Onions.

It affords me great pleasure to receive such encouraging reports, and I trust that all who have tried it, and many others who have heard of what an industrious boy can do in a garden, have this year sown a patch of onions. The rows should now be thinned if the seed is sown too thick, and spare no effort to suppress the weeds.

The Flowers

need also constant attention. To all admirers of flowers, this is a labor of love, which is done willingly and with pleasure, and not an imposed task, that is done only from a sense of duty. Work among them in the morning before you go to school, and in the evening after you get home, and at all times whenever you have a few minutes to spare from other duties. Watch their development; notice the difference between different varieties, and be ever on the look-out to tie up and pinch off straying branches, to stir the ground, and to water them whenever necessary. Weeds should never be found in the flower beds. If you have made any attempt at ribbon or carpet-planting on your beds, you must now keep the plants trimmed and of an even growth.

Tuberoses

should be supported by stakes as should also Dahlias, the large varieties of Gladiolus and all other tall-growing plants.

Verbenas

on the other hand should be kept close to the ground. Spread out the branches in all directions so they will cover the ground nicely and keep them in place with small wooden hooks. Thus fastened, the branches will take roots, which will greatly invigorate the plants. The unpretending but sweet little

Mignonette

should be found in every flower garden, sow some seed in a pot or box, set the young plants in four inch pots one in each, and train them up for window decoration. I have transplanted young plants very successfully in the garden by carefully shading and watering them till they began to grow.

The Geranium

in all its varieties is an excellent bedding plant and will generally do well on light but rich soil, when supplied with water.

Fuchsias

can also be used for bedding. They will do pretty well in a shaded place.

Callas that have been flowering indoors during the spring, should now be laid on the side, under the shade of some trees, to rest and dry out, and all other house plants should be set out doors; either planted out or the pots sunk in the ground. Use the hoe and the rake vigorously, give attention to every plant in your gardens, and remember that "whatsoever a man soweth that shall he also reap," is as true in gardening as in the spiritual sense.

THE FRUIT-GROWER'S FAMILY.

HENRY S. CLUBB.

ON the East Shore of Lake Michigan near the center of the celebrated Peach Belt, and not far from one of the best harbors on the lake, there is, nestling in the rear of the range of sand hills that at this point protect the inhabitants from the lake storms, a cozy farm-house and a clearing of about 35 acres mostly planted to fruit, chiefly peach trees. The occupation of the owner of this place is that of fruit-farmer, and in addition to himself and wife he has six children who share with him, as far as they are able, the labors and enjoyments of that rural calling.

The eldest boy is eighteen, and consequently capable of rendering important assistance on the farm. He was named after his uncle William. He had passed through the public schools and had graduated creditably at the high school of the neighboring city. He had acquired, at school, an especial taste for botanical pursuits and was quite familiar with the flora of the Lake Shore region.

Amy is a sprightly girl of 15, and although not quite through school, manages to devote a good deal of time to the collection of botanical specimens, and with the help of her brother William, has, in addition to a large collection of dried specimens, a very interesting, little botanical garden, in which her pet, wild flowers are growing, not in stiff, formal beds or rows, but in something like the charming disorder or romantic mixture and profusion of the wild woods.

The next girl, Esther, 13 years of years of age, is also fond of rambling in the woods with her brothers and sisters, but her taste is in the direction of pet animals and birds, which she delights to tame and train up so that, although of the most opposite dispositions they treat each other with proper consideration and her school of pets, a cat, a Newfoundland pup, a parrot, a squirrel and a canary constitute, with a selection from the barnyard fowls, a sort of "happy family," in the control and management of which she exhibits remarkable skill, and her kind treatment is reciprocated by wonderful affection and obedience on the part of her apt scholars.

Harry, a mischievous boy of 11, is not specially devoted to any pursuit or hobby, like the older children, but is fond of playing tricks on Esther's pet pupils and is generally disliked by them.

Susie nine, and Benny seven, are admitted to Esther's school of pets on school days on condition of obedience as scholars.

As all the children except William are attending public schools, they have only Saturdays during school terms on which to follow their special pursuits, and even that day is encroached on by duties incident to farm and home life.

Saturday afternoons, however, are usually devoted to their favorite rambles in the woods and swamps, botanizing, catching pets and the like.

The peculiar formation of the land in the vicinity of Lake Michigan affords a grand field for the research. Although at a distance, while passing in steamers, the stranger would regard the shore as uninteresting, consisting in many places of almost barren sand hills; still exploration for a mile or so inland, reveals a great variety of hill and dale interspersed with swamps and water courses, in which are found subjects of great interest to students, and even to children, who, without any scientific bias, are simply looking for amusement and recreation.

The hills, although presenting a white sandy front to the passing steamboat passenger are thickly covered on their eastern slope and with rare exceptions their summits, with hemlock, beach, maple, pine and white cedar or arbor vitæ, forming a pleasant shade. Some of the trees are so buried in white sand that only their tips are seen the storms of the lake having, within the period of their growth, piled the sand around them in fantastic shapes to a great depth, say forty to fifty feet. Wild grape vines with roots in the bottom soil are buried year after year in the sand, but their growth outcrops the highest sandhills and vines flourish perhaps 200 feet from their original roots down deep below the drift of sand. But even in the hottest weather this drifted sand is moist within a few inches of the surface and trees and vines flourish with wild luxuriance on what appears nothing but white sand.

It was while rambling on the shore among these fantastic sand-drifts and beneath the forest trees that I, all at once, came upon a scene which awakened my interest and attention. The family above described were enjoying the cool lake breeze and reclining beneath the shade of a half burned hemlock. The youngest children were playing in the sand in which little Benny was more than half buried having been discovered fast asleep by Harry who had piled the clean white sand over his feet and legs. Susie was sitting near Benny with a crown of trailing arbutus around her head. This crown as I subsequently learned had been made by her sister Amy who had a special admiration for this sweet scented wax-like flower, clumps of which she well knew where to find among the hills. Esther was petting a little chipmunk which she had caught in a knothole intending to train it up as an addition to her school of pets. William and Amy were discussing several specimens of ferns and mosses which they had collected in their rambles and examining some beautiful columbines, lady-slippers and other flowers which they were arranging in a handsome bouquet intended for the adornment of their home and a present to their mother. With them they had a basket of roots for planting in Amy's garden.

Being well acquainted with this interesting family I joined them in their discussion and learned the particulars of their various pursuits as given above. I was invited by Amy to come and see her garden and by Esther to see the performances of her pets while William said he would be pleased to show me his nursery of young fruit trees on which he was endeavoring to perfect himself in the art of budding and grafting.

As a matter of fact I must say I have never seen a family more devoted to their special subjects of study and pursuit nor one that seemed so happy in their relations to each other. The idea of domestic felicity in which I had often indulged in connection with rural pursuits seemed to me to be fully realized in this case. The results of a more intimate acquaintance to which this interview gave rise I will give in future papers. My next will be "Amy's Garden."

THE MOUND.

"WHAT are you trying to build, Sarah," said Father Morse, one day to his son's wife, as he saw her leaning on a spade, and ruefully contemplating a miscellaneous collection of stones.

"I want to make a mound," she replied. "I have seen them and they were so pretty that I thought I should like to have one, and I was considering how to manage it."

Mr. Morse's face brightened into a kindly smile. "I'm glad I found out before you wasted your strength, what you wanted," said he, "for I have seen them made, and if you will rest and look on, I will take it off your hands."

After a little search he found an empty salt barrel, removed the bottom, and after placing it on the desired spot, he speedily filled it with rich earth. Then he laid a wall of stone around it, filling all the spaces between them with the same material, packing it well as he went, his early skill in laying stone walls "down east," helping him very much in the construction. It was far from being an unsightly object before it was put to its legitimate use, and Father Morse took almost as much pride in it as did his grateful daughter-in-law; and when, later in the season, the top was filled with Pansies, China-asters, and Geraniums, and from every crevice bloomed a variety of other flowers; and running vines covered the rocks with leaves and blossoms, it was truly a "thing of beauty," and the hard-working woman who had so seldom had an opportunity of gratifying her finer tastes, gathered inspiration enough from it to ease the rugged path of farm labor. She was never too tired after her work was done at night, to water her plants and give each one a loving glance. Father Morse never visited his son afterwards without casting an admiring glance at this triumph of his skill, and the pleasure Sarah took in it was a secret gratification to him; but such is the force of habit with unthinking men, that if his own wife had asked him to construct a mound for her, he would have thought with alarm that if he should gratify one of her individual tastes it would be allowing her too much liberty, and that she ought to regard such things as he usually did, with sublime indifference. But his worthy son, John, seeing that his wife did not neglect any of her household duties, to attend to her favorites, concluded that it was safe, not to say anything discouraging to her about her flower culture, which was quite an advance for him to make. C. B. D.

Sabbath Reading.

THE LOOM OF LIFE.

ALL day, all night, I can hear the jar
Of the loom of life, and near and far
It thrills with its deep and muffled sound,
As tireless the wheels go always round.

Busily, ceaselessly goes the loom,
In the light of day and the midnight's gloom,
The wheels are turning early and late,
And the woof is wound in the warp of Fate.

Click, clack! there's a thread of love woven in;
Click, clack! another of wrong and sin!
What a checkered thing this life will be,
When we see it unrolled in eternity!

Time, with a face like mystery,
And hands as busy as hands can be,
Sits at the loom with arms outspread,
To catch in its meshes each glancing thread.

When shall this wonderful web be done?
In a thousand years, perhaps, or one,
Or to-morrow. Who knoweth? Not you or I;
But the wheels turn on and the shuttles fly.

Ah, sad-eyed weavers, the years are slow,
But each one is nearer the end I know;
And some day the last thread shall be woven in,
God grant it be love instead of sin.

Are we spinners of wool in this life-web—say?
Do we furnish the weaver a thread each day?
It were better, then, oh my friends, to spin
A beautiful thread than a thread of sin.

DORCAS AND PETER.

ONE of the liveliest occasions connected with the recent Baptist anniversaries in London, was the Zenana Breakfast, given at Canon-Street Hotel, in the interest of the Zenana missions in India. The most taking of the speeches made was by Dr. Stanford. We quote some portion of it:

Cardinal Manning has spoken with stately eloquence about the primacy of Peter, but I think something might be said for the primacy of Dorcas. Peter was all very well for a man (of course I now leave out the mysterious element of the supernatural); he was "a rich, rough gem;" he had good sound sense; he was hardy, not fearing to let the wet wind whistle through his hair; he was loud, that superlative quality in a minister, and with a voice accustomed to battle with the hiss and roar of many waters; he was the very man to make everybody hear him in a great crowd, that voice of his being doubtless one reason, along with others, why divine wisdom appointed him to be the preacher to the Pentecostal crowd. With all his distinction, if he had tried to fill the place of Dorcas for only one week, he would have been made to feel his own nothingness. He was no shy violet hiding in the foliage and pouring its fragrance from the shade. A sick-room would not have been his sphere. His hand would have been too clumsy, his voice too noisy, and his foot too tremendous on the stair for a nurse; and he would have provoked a saint to say, if a saint had been familiar with the quotation, "A ministering angel, thou!" Could you have seen him with fumbling fingers and with eyes sweeping the horizon, essay to cut out coats and garments, you would have seen directly that whatever else he might become, he would never become a sempstress. No, but the Lady of Joppa knew how to make the very needle evangelical, and she did such beautiful kindnesses with it for the women and children, that with grateful delight they fondly lingered on her name, calling her "Gazelle." For her dear sake her Saviour got a hearing, and we are quite sure that if there had been any Zenana work to do in her country she would have been the first to do it.—*The Standard.*

THE BOOKS OF THE BIBLE.

THE following metrical arrangement of the books of the Bible, from the Christian at Work, will help children, especially, to remember their respective locality in the Bible:

THE OLD TESTAMENT.

The great Jehovah speaks to us,
In Genesis and Exodus;
Leviticus and Numbers see,
Followed by Deuteronomy,
Joshua, and Judges rule the land,
Ruth gleans a sheaf with trembling hand;
Samuel and numerous Kings appear,
Whose Chronicles we wondering hear.
Ezra and Nehemiah now,
Esther the beauteous mourner show;
Job speaks in signs, David in Psalms,
The Proverbs teach to scatter alms.
Ecclesiastes next comes on,
And the sweet Song of Solomon.
Isaiah, Jeremiah then,
With Lamentations, takes his pen;
Ezekiel, Daniel, Hosea's lyres,
Swell Joel's Amos', Obadiah's
Next, Jonah, Micah, Nahum come,
And softly Habakkuk finds room.
While Zephaniah, Haggai calls,
Rapt Zachariah builds his walls,
And Malachi, with garments rent
Concludes the ancient Testament.

THE NEW TESTAMENT.

Matthew, Mark, Luke and John,
Record the life of God's dear Son.
The Apostles' Acts are next disclosed,
And Paul's Epistle, for Rome composed.
Two other letters to Corinth sent,
Are followed by One, for Galatia meant.
One also is sent to Ephesus,
And one to Philippi, one to Colosse,
Then, Thessalonians, Timothy and Titus come on,
Together with the letter to Philemon.
The Epistle to the Hebrews now comes in view,
Which shows the Old Testament fulfilled in the New.
Now follow Epistles from James, Peter and John,
In numbers reverse, of three, two and one.
And now, at the close, is the Epistle of Jude,
With John's Revealed Vision, which, in Patmos he viewed.

PERSONAL ITEMS.

Mr. Henry, inventor of the Martini-Henry rifle barrel and ammunition, is seeking in vain for adequate remuneration from the British War Office for the use of his patents by that Government.

The Rev. Orion Clemens, brother of Mark Twain, and lately expelled from an Iowa Presbyterian church for heterodoxy, was formerly a writer for the Hartford Post. He was known in the office as "the Great Orion."

Henry Young killed his wife at Pittsfield, Mass., and his insanity was so clearly proved that he was sent to an asylum. His own opinion was that he deserved to be hanged, and one morning he was found suspended by the neck with strips of bedclothes, dead.

The Princess Louise has been making the exciting trip down the slides, near Ottawa, on a raft. Through these slides, or ways, sections of the heavy rafts go down the rapids of the Ottawa River. The passengers usually get scared and wet, but there is not much danger.

Peer, who jumped from the suspension bridge at Niagara Falls, a few days ago, wore a rubber life preserver, to lessen the depth of his penetration into the water a sponge over his mouth and nostrils to prevent the water from being forced into them; and thick cloth over his feet and legs, to protect them from concussion A brass wire, attached to his shoulders, was reeled out as he fell, with just enough tension to keep him in an upright position. To strike the water flatwise would be certain death. Peer dropped 192 feet in four seconds. He was exceedingly nervous just before the feat, and it was thought that his courage had given out.

Lawyer Gallagher of San Francisco was desperately in love with Mabel Curran, but she cared very little for him. He went to her house when she was ill, forced his way to her bedside, and asked her if she would marry him. She replied that she certainly would not. "Then," he said, as he drew a revolver, "you shall be united to me in death," and he fired two shots—one at her and one at himself. Up to this point the affair was dramatic, and Gallagher no doubt intended a real tragedy, but his aim was bad. Mabel escaped the bullet by rolling over quickly, and it simply made a hole in her night-dress, while the wound that he inflicted on himself penetrated only to the breast bone.

Don't use stimulants, but nature's real brain and nerve food—Hop Bitters.

Implements and Machinery.

THE BEST!

THE "HAGERSTOWN" DRILL

Most successful Grain-Drill in use. Can change quantities of seed *while in motion*. Strong, durable, and simple, with Pin or Gum Spring Hoe and Grass Seed Sower. ☞ Standard Fertilizing Drill.

State where you saw advertisement. Hagerstown, Md.

The Robbins Cultivator

AND BROADCAST SEEDER.

CHEAP! The Imp'ement for the Times. CONVENIENT!

Adapted to almost every variety of farm tilling and seeding, and sold at less than the price of a Grain Drill alone.

THE ROBBINS is a two-horse riding or walking Cultivator; is especially adapted to breaking up fall plowing and fitting it for spring crops; for cultivating Corn, Potatoes, Beans, or any crop planted in rows or drills, the axle being set high enough to clear corn at the last working; for work on fallows, and for fitting any ground which would ordinarily require cross plowing.

It is provided with an accurate and reliable *force feed* seeding attachment, which sows all kinds of grains *broadcast*, in front of the shovels, in any desired quantity to the acre; and by gauging the depth at which the shovels are allowed to work, the grain can be covered as deep or as lightly as desired. Send for circular.

Manufactured by the

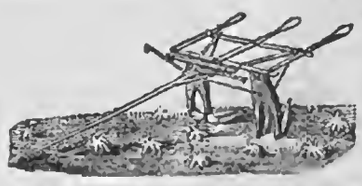
Robbins Cultivator Co., Jackson, Mich.

And for sale by dealers generally.

State you saw this in the Rural New-Yorker.

Implements and Machinery.

Prout's Hoeing Machine.



Worth double its cost to any farmer for hoeing Tobacco, Cabbage, Corn, or any other hoed crops. Has been in use in the Connecticut Valley for the past four years, and has more friends than any other implement for hoeing by horse-power. For further particulars, send for Illustrated Catalogue to

Wit and Humor.

SHE WAS WILLING TO PAY.

No one can blame her for being mad; and she *was* mad, too.

The little vagabond came into the hall on Fayette street, and wanted to sell some matches. She didn't want any matches; but he drew her attention by asking if her husband's name was John.

"Yes, his name's John, and what of that?"

"Guess I hadn't orter tell," said the match peddler, sliding towards the door.

"O, yes, you had—what is it, my boy? speak right out," replied the woman, struggling with curiosity.

"But I'm 'fraid he'll lick me, said the little wretch.

"O, no, he won't; I'll take care of you;" jealousy was just beginning to warm up; "no, he'll not lick you; wouldn't you like a piece of cake, my boy," and she brought him out a big chunk. "Now, what is it—what did he do?"

"O, not much; he was only a walkin' with her—at first."

That "at first" settled the matter; she was blazing with jealousy.

"Well—well, what did he do next? O, that villain! Come, young man, then what did he do? Do you know who she was? Come, speak up."

The boy opened the door and stood in the opening. He began to whimper a little.

"O, I can't tell you, mum; I didn't know's ye'd care. Yes, I know'd who she was, but I can't tell ye; he'd kill me."

"See here, you young villain, you'll never step out o' this house till you do tell me;" but the boy dodged her and was on the steps. So she coaxed him. "O, come back, my little man; I was only foolin'; jest wanted to see if you'd be scared; come—come back in, and I'll give you something nice."

The boy reluctantly stepped into the doorway again.

"I don't want to tell ye," he sniveled; "I know he'd give me five dollars not to say a word about it, an' I guess I'll go an' see him 'bout it," and he slid toward the door again.

"Hold on—here, what can I give you? I haven't got much money, here—here's a dollar; will you tell me all about it now? Come, that's a good boy; now, what did he do, who was she?"

The boy took the money, looked it over to see if it was good, stuffed it in his pocket, looked up at the woman, and replied in a whisper—

"He kissed her, marm—right here on these steps."

"O, that villainous deceiver!" she cried, wringing her hands "But I'll make her wish she was cremated when I get hold of her! O, John, John, how could you! Here, boy, take this fifty cents; and now tell me who she was."

By this time the boy was down on the steps; but he looked back, smiled compassionately, and said—

"It was you, marm, when he went away to his work," and he went down the street at a high rate of speed.

"WHEN a man puts an innocent hen to work over a porcelain egg, is he setting that hen a good egg-sample?"—*Philadelphia Bulletin.*

Deal Gently with the Stomach.

If it proves refractory, mild discipline is the thing to set it right. Not all the nauseous draughts and boluses ever invented can do half as much to remedy its disorders as a few wineglassfuls—say, three a day—of Hostetter's Stomach Bitters, which will afford it speedy relief, and eventually banish every dyspeptic and bilious symptom. Sick headache, nervousness, sallowness of the complexion, fur upon the tongue, vertigo, and those many indescribable and disagreeable sensations caused by indigestion, are too often perpetuated by injudicious dosing. An immediate abandonment of such random and ill advised experiments should be the first step in the direction of a cure; the next step the use of the standard tonic alterative, which has received the highest medical sanction and won unprecedented popularity.

"IN RANGE."

Old Gent (in Stage.) "I trust your Rifle is not loaded, Sir, because with this shaking it might go off!"

Militiaman, (nettled). "No, it's not loaded, Sir. And if it were to go off, it wouldn't hit you!"

Old Gent. "Oh, jus' so, Sir. But—you'll pardon me—I was not considering myself so much as the poor Passengers on the Roof!!"

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 24. WHOLE No. 1533. | NEW YORK, JUNE 14, 1879. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

Rural Architecture.

HISTORY OF A POOR FARM.—No. 10.

A BARN is the farmer's workshop or manufactory, and if it is badly arranged or the yards about it are inconvenient for handling the stock, much time is lost and labor thrown away. When I came into possession of my farm, there was no barnyard, and, practically, no barns. A few tumble-down, "ramshackle," old barracks, and a dilapidated shed, which had done duty in past ages as the local schoolhouse, comprised the farm buildings, along with a small, bright-red-painted building, which was nearly new and which, like a shiny, new hat upon a ragamuffin tramp, only made the general raggedness and wretchedness of the rest of the belongings more conspicuous. No stock had been kept on the place for some years; my old neighbor had informed me that for over 30 years one horse and one cow were the most he remembered being kept there at one time, so that the buildings were hardly needed and a yard for manure, where no manure was ever, or hardly ever, seen, was of course superfluous. The rough sketch given on page 375, represents the character of the buildings and the general appearance of the "key to the farm" at that time. The only vehicle kept about the sheds at that time, was a dilapidated wheel-barrow, which, I suppose, was used to convey the harvest from the fields to the barns. The yard was unfenced, nor was there any use for a fence. Such a yard is not altogether unique; others can be found elsewhere much of the same character, but then there are other poor farms besides the one of whose history I am telling.

The first outlay made after I came into possession, was for building a barn in which to keep some cows. The site of this was chosen where, in the old barnyard, a crazy, old barrack with broken roof, stood at the foot of a slope. Here was a good chance to put a basement stable with manure cellar. This was made 50 feet long, 24 feet wide, 16 feet high, and with a cellar or basement wall of brick, seven feet high in the clear. Part of this basement was intended to receive the manure from the floor above; and at the east end (the barn faces the south) was made a cellar for roots. A long shed was built connecting the brilliant red barn with the new building, and 42 feet long, 20 feet wide, and 12 feet high to the eaves; one end was used for a stable for three horses and the other parts were open sheds for tools, machines, wagons, etc. At the foot of the hill on the west, was a fine spring over which a milk-house was built, and a pipe was laid from the spring to a pump in the yard, before which was placed a long watering trough accessible from both yards. Two barracks were made in the yard east of the barn for storing straw or hay, and these were inclosed half way up and used when needed for calf pens, and pens for incoming cows. The space between these barracks, 20 feet long, and 16 feet wide, was made into a yard for the pure Ayrshire bull which was selected from a first-rate herd, as the foundation for the making of a dairy herd. In the front, at the east of the first yard, was built an office and store-room, and here are held the agreeable chats which go to make up a large portion of the history of this poor farm. The plan has no particular merit, except that it is convenient and cheap. It suited the arrangement of the fields and the character of the ground, and it utilized what there was worth anything in the old arrangement. The yards are perfectly well protected from the north and northwest winds, are sheltered and warm.

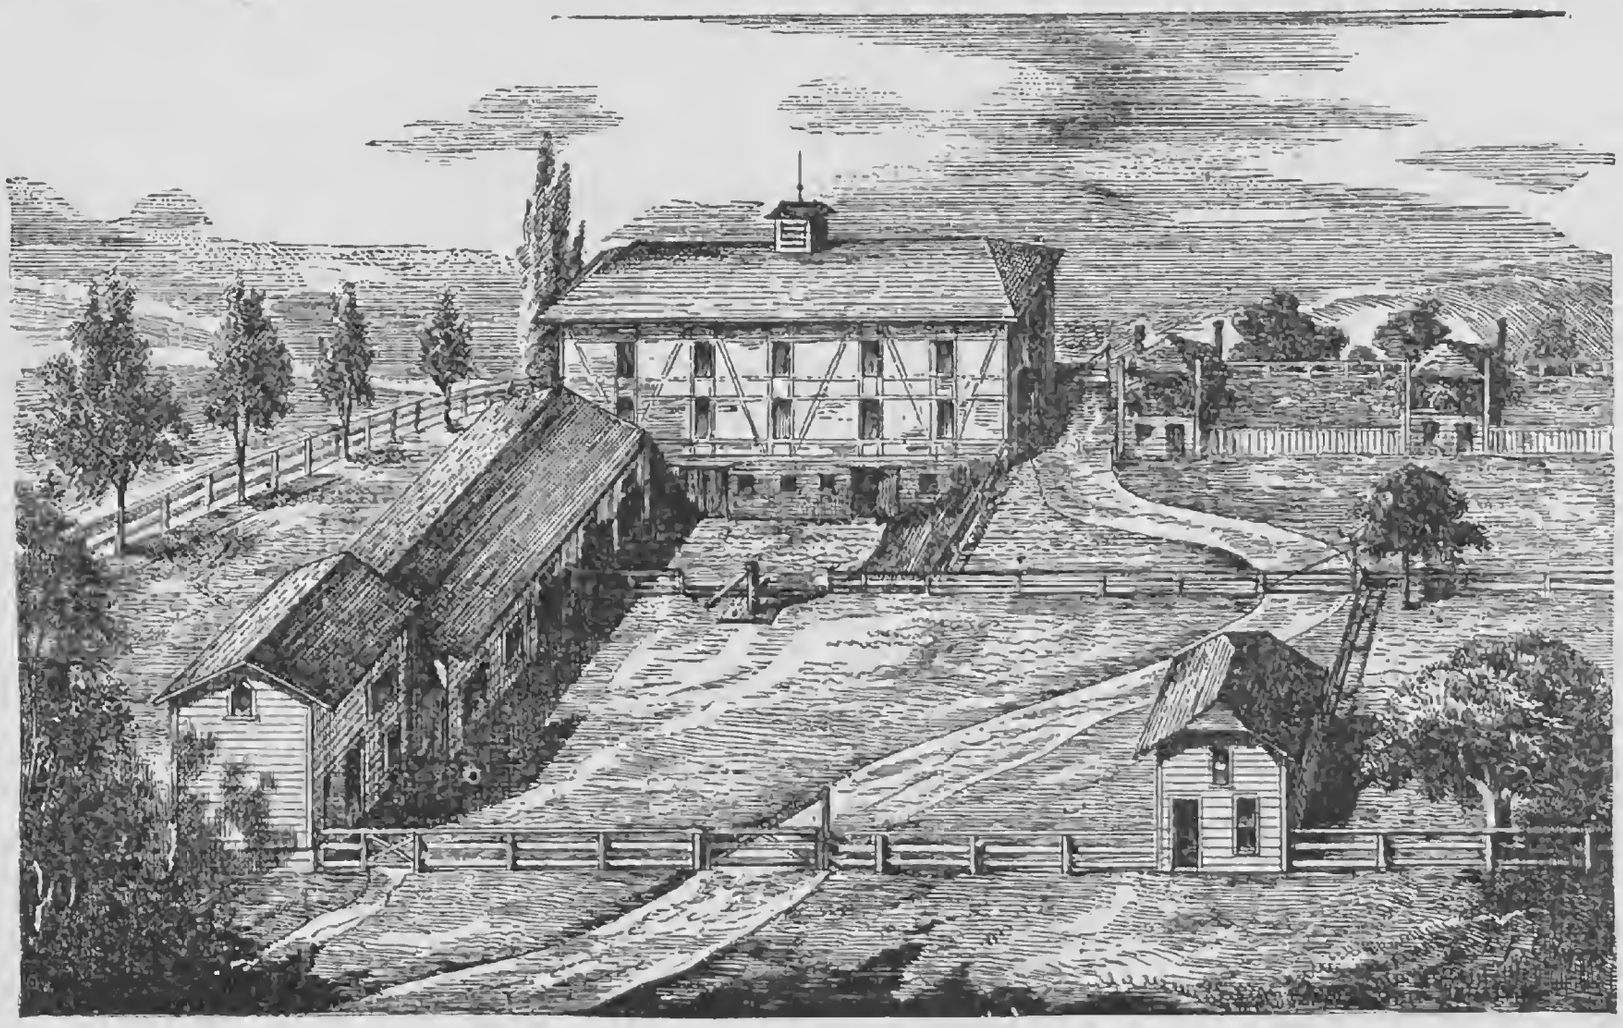
"What do you want of so many yards?" asked my old neighbor, as I was explaining the result of my building.

"I find them very convenient for handling the cows with very little labor," I replied. "The cows are turned out after feeding in the morning into the yard in front of the barn, where there is water and shelter in bad weather, under the open sheds. Here they can stay while the men are at work on the farm elsewhere, and remain until it is time for the noon feed. They are then driven into the next yard, where there are some feed racks, and into which Fred has previously brought a load of rye from the field. The racks are filled, and then the cows are turned into the yard, where they feed during the dinner hour. After dinner they are put into the barn and given, each, three quarts of mixed feed of two-thirds of ground corn, oats and wheat bran and one-third of cotton-seed meal, when they lie down on a clean bed which has been prepared for them, in a clean, cool stable darkened by shutters, and rest until afternoon milking time, which is half after four. The large yard is for the horses and for hitching to the wagons and tools, so that everything is done separately and in order, and no time is lost. When the cows are shut up in the barn, the bull and the calves are turned into the yard and consume what the cows have not used. Not a single dropping of manure is lost and not a leaf or blade of vegetation is trampled upon or spoiled."

"It costs too much money," objected my old friend.

"I don't care for that," remarked Mr. Martin. "If one has the money to spend he can not use it better. I think the plan is a good one, with some exceptions. It was made to save the red barn, and it would have been cheaper to burn that up than to spoil a good plan on account of it. It is like building a new carriage to an old pair of wheels, or making a new coat to suit a set of old buttons."

"I think that old barn you object to worth saving," said I. "In remodeling old buildings, I would save what could be kept and made useful. The old red barn serves to store hay for horses and a door is cut from the loft into a feeding room above the new horse stable, so that in that business, time and work are saved. In stormy weather the men can pass from the old barn through the upper floor of the shed, where tools are kept, into the cow barn, and do their work there without going out-of-doors; and by using the water from the cistern in the rear of the barn, which takes the roof water, and from which a pipe from a pump is brought into the barn, the cows and horses can be watered in-doors, if desired. I have studied economy of labor, and I want to show our old friend that in saving labor I save money. The money laid out in these buildings and yards will save half of one man's time in attending to the stock, which will be equal to $150 a year, and that will pay 10 per cent. interest in the cost of the whole arrangement."



HISTORY OF A POOR FARM.—The Barn-Yard as it Is.—(See p. 375 for "As it was.")

The Herdsman.

JERSEY COWS.

T. H. HOSKINS. M. D.

Claims of their Friends.

A FEW years ago I interviewed a Short-horn breeder upon what he regarded as the objections to Jerseys. I said to him that it was claimed there were no herds of dairy cows in New England which could average 300 pounds of butter a year per cow, except those having Jersey blood in them; also, that there were no herds whose butter was so uniformly of good color, nor, when properly manufactured, of such firmness, perfection of grain and excellence of flavor; that, in short, a Jersey herd would yield more and better butter than a herd of an equal number of any other kind, with the same feed and care.

Charges Against Them.

My Short-horn friend answered—first denying that Jersey butter was any better than Short-horn butter—that the Jerseys are worth little or nothing for beef, or for raising veal calves; that they are of no value for cheese, or for market-milk, or for anything but butter; that the bulls are as dangerous as tigers; that the cows are nervous, high-strung creatures, and very apt to be kickers; that they are not hardy in our climate, and are especially liable to attacks of garget; that they are enormous eaters, and require much grain feed in proportion to the quantity of milk yielded. This was the whole indictment, as made out by my friend. I think he accidentally omitted to charge that their hides do not make so much leather as those of Short-horns.

Charges Investigated.

I then inquired of another friend, who had been an extensive breeder of Jerseys, but who had shifted to Ayrshires because grade Ayrshires give much larger messes of milk, and his sales were mainly of choice village cows, the buyers of which want to sell surplus milk to help pay the cows' keep. I showed him the Short-horn man's charges, and requested his candid criticism thereon, which was given as follows: To the first objection, he said the Jerseys make no pretensions to being a beef breed. The true question was whether, taking two average herds, one of Jerseys and Jersey grades, the other of Short-horns and Short-horn grades, keeping a strict account of cost and keep on one side, and of sales of produce—butter, beef and veal calves—on the other, the profit will incline in favor of either, and if of either, of which? If the milk were made into butter and sold in the same market, it was his judgment that the extra quantity of the Jersey butter, without any allowance for quality or any saving in feed in an equal number of cows, would more than balance any profit from sales of beef and veal. But if the milk were made into cheese, or sold for market milk, the Short-horns, if good milkers, would pay best. This answer to the first count covers the second, also.

In regard to the fierceness of Jersey bulls, he said they are often unruly, especially if kept confined. But he believed that a bull of this breed might easily be so reared and handled as to be quite safe, with ordinary precaution.

The fourth objection, the nervousness of the cows, he said was an objection only with those who make use of milking-stool gestures and cowhide-boot discipline in the cow-stable. He thought kicking men made kicking cows, and that while the Jerseys are not yet so thoroughly christianized as to love their enemies, they know their friends. They are a lady-like breed of cows, and will submit to be handled only by gentle men.

As to hardiness, he observed that the Jerseys will not endure as much roughness as the poorer class of native cows, but they are healthy and long lived under the only trea

ment which is profitable with any kiud of dairy stock. He added that they are uot more liable, in his experience, to suffer injury from garget than any good cows, perhaps less so than the more profuse milkers. Finally, he admitted the charge that Jerseys are good feeders, and cousidered it a merit. They are as hearty eaters as the natives, said he, and will average to make twice as much butter from the same feed.

Increase of Jerseys in Vermont.

Since the above reported interviews were recorded, the number and size of Jersey herds in Vermont have greatly increased, and the progress in this direction continues unchecked. I well remember that when the few Jerseys present were brought into the ring at the Vermont State Fair, held in Rutland in 1873, one of the Winslows of Putney, Short-horn breeders, who was one of the judges, observed, contemptuously, "Well, the scrawnier you get them the better you like them, don't you?" At the two last State fairs the Jerseys outnumbered every other breed, and were treated with the respect they deserve. Now for some of the

Practical Results of Jersey Dairying

in this State. The place where the Jersey stock has longest had a footing among our dairymen is in North Pomfret, Windsor county, where perhaps ten or a dozen farmers have had Jersey herds for the past eight or ten years. These herds have been mostly grades, but have been graded so high—only thoroughbred bulls being used—that very little evidence of native blood is seen in them at this time. Many of the cows are pure-blooded, but merely as butter-makers these are not always thought to be the most valuable. These Pomfret farmers live among the hills; their farms are usually less than 100 acres, and their milking herds vary in number from six to fifteen cows. They are intelligent, educated men, yet men who do their own work, especially in the case of their cattle. They exercise great care in selecting, feeding and handling their cows, and in the manufacture of their butter, and they get prices considerably above the highest quotations. Some, by making fancy prints of two to four ounces for first-class hotels and restaurants, have got what might be called fancy prices—60 cents and upwards, per pound—but that is not the rule.

I will take Mr. E. S. Wood as illustrating the dairying of North Pomfret fairly in his practice. He has his cows come in at all seasons, but mostly in the fall. During the season of pasturage they are yarded at night, and fed one or two quarts of corn-meal, according to age and condition, before milking, they being tied up for that purpose. They are also fed a little hay. Care is taken that milking should be at regular hours, and as much as possible without change of milkers. When the pasturage becomes short in the fall, fodder corn and green oats, or mown grass, are fed until severe frost occurs. Later, the grain feed is increased to two or three quarts of a mixture of equal parts of meal and wheat bran. Cows that come in in fall and winter have a larger ration of the same while in full milk. Early-cut hay and corn fodder are considered good winter feed; but Mr. Wood says straw cannot be made equal to good hay for milk by any addition of meal. Dry cows are kept on coarse fodder until near calving, when they have good hay and two quarts of oats daily. After calving, for a few days they have light feed, with warm water to drink. The stables are kept warm and dry. Mr. Wood does not mention feeding roots at all, but I believe he raises a few, though not enough to make a regular ration for all of his cows. In 1877—the last report I have—Mr. Wood made 3,788 pounds of butter from 13 cows, or an average of 291 pounds to the cow. This butter sold for $1,341.36, an average of $95.39 per cow.

Other Jersey Herds.

But by no means are all of our Jersey dairymen confined to Pomfret. Mr. Nathan Skinner, of Plainfield, Washington county, made in 1877, from a herd of 18, 4,842 pounds of butter, sold at an average of 33 cents—269 pounds of butter, or $88.77 in money, to the cow. E. R. Skinner, of Tunbridge, Orange county, from a herd of five cows, sold, in 1875-76, 1,677½ pounds, and in 1876-77, 2,065 pounds, the average per cow being 335½ and 413 pounds, respectively.

Perhaps the largest Jersey herd in Vermont is that of E. A. Ponks, of Passumpsic, Caledonia county, who in 1878 made, from 24 cows and heifers, 6,900 pounds of butter, or 287½ pounds per head.

These reports are none of them from breeders of Jerseys for sale or from fancy stock. I think few if any of them are registered, and many are only high grades, though there are more or less pure-bred cows among them. The parties are plain farmers, who keep the Jerseys for their value simply as large producers of fine butter that always sells above the market in Boston, when properly manufactured and neatly put up for sale. Our good farmers perceive plainly that the day of "middling-good" dairy products is over, and that a small yield per cow will not pay for the keeping. Therefore they are seeking earnestly for the right cows, and the best methods of manufacture and preparation for market. I believe that the decline of price for dairy products is a scarcely disguised blessing, the prompt result of which is to be such an improvement in our stock and methods of feeding, care and manufacture, as in five years will increase the average product of our dairies fully fifty per cent. in quantity, and absolutely eliminate the lower grades of butter and cheese from among the products of our State. It is "root, hog, or die," among our dairymen at this time, and by "rooting" or "dying"—by improving their method or abandoning the business—our dairymen will soon reach a level far above the highest aspirations of a few years ago. And the Jerseys are a great help in the work.

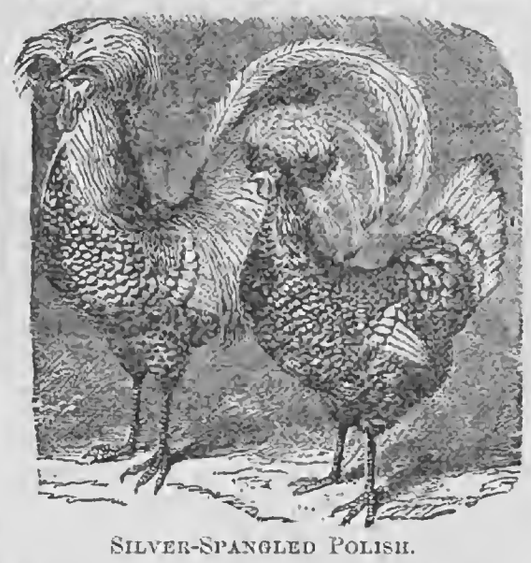
The Poultry Yard.

SILVER-SPANGLED POLISH.

A. M. HALSTED.

The Polish class of poultry consists of seven varieties — the Golden-spangled, Silver-spangled, White-crested Black, White-crested White, Black-crested White, Buff, and Blue Polish.

The Black-crested White are supposed to be extinct, none having been seen for many years. Numerous attempts have been made to develop a new strain of them, but thus far without success. The Buff and Blue varieties are very little known in this country, and comparatively rare, even in England. The Silver spangled—the subjects of our illustration—are probably



Silver-Spangled Polish.

the most common and best known of any, and about the largest, the weight of the cocks being from six to seven pounds, and of the hen from four to five and a-half. The ground color of the plumage is silvery-white; the ends of the feathers having clear, distinct moon-shaped black spangles. The hackle and saddle-feathers of the cock are white-edged and tipped with black; the tail feathers, clear white, ending in a clear black spangle. The wing coverts should also be marked with black, so that the spangles form two distinct bars across the wings. The evener and more perfect these bars, the more the bird is valued. The breast, also, should be evenly spangled with black, not so close together as to appear black, which is a fault. The feathers of the crest are black at both base and tip, the middle of the feathers being white or gray, white being the color most sought for. The crest should be even and regular in shape, not hollow in the center. The ear-lobes are small and white. The wattles are wanting in the bearded varieties; in the others they are small and regularly-shaped.

The feathering of the hens is almost exactly like that of the cocks. In the crest, which should be full and globular in shape, the feathers should fit in so closely together that the appearance is that of a round, spangled ball. In both sexes, white feathers frequently appear in adult birds after the second molt. These are regarded as very objectionable though not a disqualification. Silver Polish are good layers of medium-sized eggs, and of fair quality for the table. They are non-sitters, very quiet, and readily become attached to those who take care of them. They do not attain their fullest development of plumage and beauty until the third season.

The objections to them are: the danger from hawks—their overhanging crest so obstructing their sight, that they do not see hawks until too late to escape; and their tendency to roup and cold. They must be kept dry, both young and old; the crest gets saturated with rain or dew and as the bird cannot dress that part of its plumage, it remains wet and produces roup or cold. It is useless to try to raise them in low, damp localities. They need high, dry yards and ample shelter from the weather.

The young chicks while fledging need stimulating food; the great quantity of feathers which they have to develop is very exhausting to the system, and unless the chicks are supplied with meat or scraps, in addition to the usual grain diet, they are not apt to thrive. Stale bread soaked in sour ale is excellent for both young and old. English breeders say that the young should never be given to a large hen, the top of the skull being very thin, they are much more liable to fatal injury under a heavy hen than under a light one.

Westchester Co., N. Y.

Farm Economy.

BULK OF FOOD AND DIGESTION.

E. W. STEWART.

In the proper nutrition of all classes of our domestic animals, this question of bulk needs careful attention. Numerous attempts have been made, in feeding horses, to disregard the necessity for a given proportion of fiber to be mixed with the grain ration; but the result of feeding concentrated grain, or fine meal ground from it, alone, has brought numerous diseases of stomach, and often death to the animal. The theory, often expressed by physiologists, that the stomach required filling to a certain hight to stimulate the secretion of the gastric juice, is probably faulty in not noting the necessity for the food to be in a porous state, so that the gastric juice can have a free circulation through the contents of the stomach. Fibrous food cannot be compressed into a solid mass, and when meal is fed in connection with hay or other coarse fodder, the fibrous food separates the particles of fine meal and leaves a free passage for the gastric juice throughout its whole bulk, and thus digestion proceeds simultaneously through the whole contents of the stomach. Now, if the concentrated meal is fed alone, it will form into a compact ball, like the housewife's dough; and it is easy to see that the gastric juice cannot penetrate and circulate through this solid mass in the same way as through the porous bulk of hay and meal. And the turning and rolling about of food in the stomach by its muscular action, described by animal physiologists, cannot cause a bolus of meal to become porous so as to facilitate its permeation by the gastric juice; for, as is well known, the mass is too plastic and adherent to be so easily separated. Fine, concentrated food alone, taken into the stomach of a bovine, is not raised and re-masticated, but passes on to the true or fourth stomach in its concentrated state; and, may we not suppose, from its compact condition, often remains undigested for so long a time as to engender fever and other stomach complaints?

Nature has furnished for all our most important domesticated farm animals—(horses, cattle, sheep and swine)—bulky food—the grasses and other forage plants. And, is it not reasonable to suppose that when we feed fine meal, or concentrated grain alone, we do violence to the nature of the animal? It is simple heedlessness, neglect of the proper study of the natural wants of our animals, that leads us to feed concentrated food without due admixture with hay or coarse fodder. Mr. Miller has even become a strenuous advocate of wintering cows on corn-meal alone, and because he has been able to keep cows six or eight weeks in an abnormal condition on corn-meal, he thence infers that the ordinary course of nature may be set at naught with impunity. But, although he commenced this course of feeding some eight years ago and found it very cheap, compared with hay, yet he has never carried his cheap feeding through a whole winter season, as might naturally be expected after he had discovered its great economy. We know that animals may, for a time, be kept in an abnormal condition, and on return to the ordinary ration go on without any serious disturbance of health. Men have been gradually accustomed to the use of deadly poisons and survive their use for many years; but it is not thence argued that this would be a proper regimen to put the whole race upon. It has been found that men may not long be healthy upon very concentrated food without the use of bulky vegetables, and yet the human stomach is especially adapted to the use of concentrated food.

An excellent illustration of the necessity of coarse fodder to the health of cattle is found in the practice of feeding large numbers of cattle in distilleries upon the refuse of corn after using the largest part of the starch in the manufacture of spirits. The food is not lacking in albuminoids, and if coarse fibrous food is not necessary to health, these cattle might be fattened upon the refuse alone. But the universal testimony is that not less than five pounds of hay per day to each animal, will suffice to maintain health and allow profitable progress in fattening. One experienced feeder, who fed a 1000 head per year, stated the hay absolutely necessary to economical feeding to be eight pounds per head. The writer made special inquiry into ten cases and found the amount estimated as necessary, to range from five to ten pounds per head. It will also be noted that the general testimony was that the quality of the hay was not material—that it only required some fibrous food for rumination and to keep the bowels in proper condition.

The writer has never found any serious difficulty in feeding a proportion of very concentrated food to colts after weaning, such as corn and oats, or peas and corn, or rye and oats ground fine together, if the same was mixed with cut hay, in the proportion of two of hay to one of meal in bulk, or better still, equal parts by weight. It does not answer to feed the meal and then give the hay; they must both be fed at once, moistened so that both must be eaten together. This causes the masticated food to go into the stomach in such a porous condition that no ill effects can arise from the meal. Too much grain must not be fed, but a proper amount, given with cut hay, will no more injure a colt than a grown horse.

This matter of bulk in the food of our animals is so important that every feeder should thoroughly understand and apply it.

VITAL PRINCIPLES IN AGRICULTURE.

W. B. DERRICK.

The fertility of the soil must be sustained in some manner, as every good farmer knows, or it will soon become exhausted and barren. This fact has been exemplified perhaps more fully and clearly in "the fertile West" than in any other section of the country. The deep, rich, black soil of the prairies, containing all the elements requisite for the production of bountiful crops of wheat, rye, oats, barley, flax, corn, potatoes, etc. seemed inexhaustible. It appeared as though the bottom could never be reached, and that it would never become "poor" or sterile. The native prairie-grass had been burned off annually, from time immemorial, just as it is yet on our unsettled domain; and so long as the land remained unbroken and uncultivated, those vast sweeping prairie fires did much good in clearing away the surplus vegetation and helping to keep up the fertility through the addition of alkaline matter. In those days, before the white man encroached upon this goodly land and commenced to "subdue it," it had nothing to do but to rest and recuperate after its natural production of vegetation, the most of which was immediately returned to it, so there was nothing lost, but instead of depletion, a constant accumulation of rich vegetable mold. The pioneer came and commenced a system of slow but sure robbery of the soil, by cropping it successively from year to year without resting or renewing it in any way. Concentrated crops of grain were produced and removed, and the straw piled up and burned, as those early prairie farmers had but little live stock, and were more desirous of getting rid of the straw by burning it than of turning it into manure. By such improvident farming they were injuring and killing "the goose that laid the golden eggs." For a number of years, the "rich" prairie soil continued to honor the heavy drafts made upon it, but at last its resources began to weaken and show signs of failing. Spring wheat was one of the principal crops grown in this region, and it seldom failed at first, but after years of successive production, it began to be unprofitable from frequent partial failures. Chinch bugs, rust and various other pests, were the apparent causes of failure, but back of all these, was the great prime cause of causes, viz: the exhaustion of those ingredients in the soil requisite to the growth and health of the wheat plant.

How to Renovate the Soil.

is now the all-important question with many of our Western farmers, but they are learning and becoming wiser as they grow older. We seldom see huge bonfires now from burning straw stacks, though there are still a few. I moved from Eastern Ohio to this part of Northern Illinois in 1869, and among the first strange and unseemly sights that attracted my attention was the burning of straw to be seen in every direction over these beautiful prairies. I am now glad to note a marked improvement within the past nine years, as the farmers are giving more attention to mixed husbandry, the rotation of crops, and to the raising of live stock. It is a well established principle in philosophy and nature that there is nothing lost. Things may be misplaced, scattered, demoralized and rendered incapable of right action, but never annihilated. Stolen treasures may be restored, or their places supplied with others of a similar kind. So, too, in agriculture, the soil that has been robbed of its fertility, may again be recouped by judicious management and the requisite application of manure. It takes both hard study and labor to do this; but it will pay better than money at interest; and the time spent by the thoughtful farmer in reading agricultural papers and books, is the most remunerative and valuable of his life, as it adds both to his mental and his pecuniary wealth. The successful farmer must be intelligent and well informed on all things pertaining to his calling or "profession;" "for knowledge is power," and it will help to drive the plow, as well as govern in matters of commerce and legislation. We have great hopes of the prosperity of this country, as knowledge is increasing and

agriculture is keeping pace with the advancement of the times.

Balleyville, Ogle Co., Ill.

OUR BIRDS.

It takes a good deal of agitation to make the farming community understand what some of their most important interests are. Timber planting, for instance, was written about and talked about for years before anything was effected, and even now the majority of the farmers are only just beginning to réalize its importance. There is another subject of vast importance to the farmer on which little is ever said; namely, Birds. Farmers are aware that they have to contend against insect enemies innumerable, but they cannot realize how much the birds assist them in keeping such pests down, because they have never been without such aid. Some idea, however, of the number of insects destroyed by a single pair, may be formed by watching them while feeding their young. Men think that the robins, for instance, spend a good deal of time in their small-fruit gardens, or among their cherries (and even here they do not confine their attention to the fruit), but they can well afford to spare from their abundance what few the birds take for the sake of their assistance in fighting insects. Prof. Cook says that, after numerous examinations of their stomachs, made with the greatest care, he is convinced that "birds, not excepting even the robin and jay, are the farmer's friends." The blackbird, the much-abused crow, the wood-pecker, and all our common songsters are valuable assistants. And not only are birds valuable aids in combatting insects, but they also destroy great quantities of weed seed. Let any one watch a flock of birds gather about a patch of dried weeds late in the fall and he will be convinced of this. If you appreciate the importance of the assistance rendered by our feathered friends, what do you do to encourage them? Do you have shrubbery for them to rest in? Do you teach your children to respect the rights of the birds? Do you have a bird house? Do you encourage the swallows around your barn? Do you do anything to encourage their presence and increase their numbers? There ought to be in each State a strict law against destroying our common song birds or their nests, and it ought to be strictly enforced. Let every farmer exert himself to secure the enactment of such a law. The game laws, also, are generally too lax and but laxly executed. For instance, one quail cannot be found now in Northwestern Ohio, where ten years ago there were whole flocks; and this is principally owing to the depredations of "sportsmen!" Every man and boy too lazy and shiftless to work, will range the country throughout the season hunting quail. Not to speak of the damage that such characters always inflict on property, they are fast exterminating the quail. Let every farmer work to secure a public sentiment that shall demand the enforcement of the laws against such characters.

THE BARN YARD AS IT WAS. (SEE FIRST PAGE FOR "AS IT IS.")

Farm Topics.

HIGH FARMING AND LOW PRICES.

We have to thank Dr. Lawes of Rothamsted, England, for a copy of an address delivered by him, on May 3rd, before the East Berwickshire Agricultural Association. Parts of it, chiefly of a local character, are of interest mainly to the British farmer, but the bulk of the work, treating of the general principles of economic agriculture, must be extremely interesting and instructive to our readers as well as to intelligent farmers everywhere. Of these parts we have here reproduced the principal ones.

High Farming.

At the outset the speaker reviews briefly the present depressed condition of British agriculture, which he attributes to the combined effects of a succession of bad seasons, cheap grain, dear labor, cheapening meat and close foreign competition, especially with the agricultural products of this country, and the object of his address he declares to be, not to discuss the applicability of all the suggested remedies for this depression, but to examine the advice frequently offered, that lower prices should be met by increased production; in other words, whether a higher standard of farming can be recommended to compensate for a reduction in price. Supposing, for instance, there were a permanent reduction in the price of the salable produce of the farm to the extent of 20 per cent. would the proper remedy be to increase our produce per acre by one-fourth, and so bring up the salable value to the same amount as before. This could only be done by what is termed high farming, which he pithily distinguished as *intensive* in contradistinction to the *extensive* farming commonly practiced here. Farming on the four course system of rotation, consuming each alternate crop on the farm, and in addition to this converting all the straw of the grain crops into manure but without the use of any purchased foods or manures, though sometimes ignorantly called by that name, would not be high farming; but, on the contrary, he considers it one of the main causes of the present depression. "High farming is a very different process. It implies the importation of material from without. All soils are capable of yielding more or less annually from their own substance to the produce which grows upon them. But, the greater the amount of cattle-food and manure purchased and brought upon the land—that is, the higher the farming—the less will the soil itself contribute to the crops. Indeed, in many cases, it contributes nothing at all, but becomes richer by the process. Under such circumstances, the soil may be said to serve mainly as a reservoir for the manures applied, and for the necessary moisture, and to afford support to the growing plants; so that, with the aid of the sun's rays, they may be enabled to accumulate carbon (and other constituents) from the atmosphere. They thus, so to speak, manufacture raw material supplied from external sources. Under such conditions agriculture is a manufacture depending on the products of other soils and on the atmosphere for its raw material, just as much as do the manufactures of wool, cotton, and silk depend on external sources for their material."

This system has found many advocates in England, chiefly on the ground that most of the expenses connected with farming are much the same, whatever the value of the crops grown, and consequently that, with the exception of the extra cost of the manure applied to grow the larger crop, the charges remain much the same whether the amount and value of the produce be great or small. If the application of two or three times as much manure yielded twice or thrice as much increase of crops, then he concedes that this style of high farming would be a remedy for lower prices; but the results of some of the field experiments at Rothamsted conclusively show that the higher you farm, beyond a certain limit, the less is the amount of increase you obtain for a given amount of manure, and therefore the greater the cost of that increase. It is frequently assumed that the manure made by feeding stock costs nothing; that by skillful and judicious management the cost of the food and the other expenses will be covered by the value of the meat produced and sold; and that, this being so, the manure is obtained gratis. But the fact is universal in England, and frequent in the older-settled parts of this country, that the food of an animal will, as a rule, cost more than the meat produced will sell for; and that, consequently, the cost of the food and the other necessary expenses can only be recovered by charging a portion to the manure.

The speaker next gave a highly interesting account of a series of experiments at Rothamsted, on the ordinary four-course rotation of turnips, barley, clover or beans, and wheat. The experiments lasted 31 years. One-third of the land was kept entirely without manure during the whole period of the experiments; one-third received mineral superphosphate of lime alone, every fourth year; that is, for the root crops; the other third received, also every fourth year, a liberal dressing of a complex artificial fertilizer, composed as follows:

	Per Acre.
Rape cake	2,000 lbs.
Sulphate ammonia	100 lbs.
Muriate ammonia	100 lbs.
Sulphate of potass	300 lbs.
Sulphate of soda	200 lbs.
Sulphate of magnesia	100 lbs.
Superphosphate of lime	350 lbs.

Each of the three portions, so differently treated as to manure, had been divided into two experiments. From one half, the whole of the produce, roots and tops, grain and straw, and clover, had been removed. On the other half of each, the only difference had been that the roots were fed on the land by sheep having no other food, and the tops were also left on the land. The results of these experiments concern the European farmer chiefly, and are declared to have been somewhat disappointing, and that to farm still higher, as prices fall, would be a mistake. "We have learnt much," says Mr. Lawes, "respecting the action of manures, the requirements of different crops, and the influence of climate upon them, during the many years of the progress of our field experiments, and among other things, that we can gather up much more of the manure applied, by means of a mangold than of a turnip crop."

The part of the address which will chiefly interest American farmers, inasmuch as its lessons are equally applicable to their own conditions, is that treating of

Experiments with Farm-yard Manure.

"In these experiments," says Mr. Lawes, "farm-yard manure has been applied for many years in succession to different crops. When you are urged to farm higher, the meaning is that you should put more dung upon your land. Consequently, it is of great importance to ascertain, with as much accuracy as possible, the effects of the application of large quantities of dung.

PRODUCE OF WHEAT AND BARLEY, BY 14 TONS FARM-YARD MANURE PER ACRE, EVERY YEAR.

	Average per acre per annum.	
	Dressed Grain.	Straw.
Wheat, year after year on the same land—35 years, 1844-1878.	Bushels.	Cwts.
First Period, 8 years, 1844-1851	28	26⅝
Second Period, 9 years, 1852-1860	34⅛	34⅝
Third Period, 9 years, 1861-1869	37⅞	33⅝
Fourth Period, 9 years, 1870-1878	31	29⅞
Barley, year after on the same land—27 years, 1852-1878.		
First Period, 9 years, 1852-1860	44	26
Second Period, 9 years, 1861-1869	52	30⅜
Third Period, 9 years, 1870-1878	49¾	29⅝

"In the table is given the produce of wheat, grain and straw, and of barley, grain and straw, by the application of 14 tons of farm-yard manure per acre per annum. In the upper division of the table the results obtained with wheat, and in the lower those obtained with barley, are recorded. The experiments on wheat have now been continued for 35 years, and the average produce per acre per annum is given for the first eight years, the next nine years, the next nine years, and the last nine years. The experiments on barley have been continued for 27 years, and the results are given for the three periods of nine years each, corresponding with the last three periods in the case of the wheat.

"Referring first to the wheat, you will observe that the average produce of the first eight years is the lowest, that of the next nine years is higher, that of the third period is higher still, and that of the last nine years again is considerably lower, being only about three bushels more than over the first period, about three bushels less than over the second, and six bushels less than over the third period.

"It is quite obvious from this result, that the produce was not at all in proportion to the accumulation of manure in the land. When the soil was analyzed a few years ago, it was found that the first nine inches in depth were nearly twice as rich in nitrogen as any of the artificially manured plots, yielding as much, or even more, produce. There can be no doubt that whilst, there is a general tendency to increase in produce as the result of this great accumulation of manure in the soil, the fluctuations are greatly dependent on the characters of the seasons. Thus, the third period, which gives the highest produce, included some very productive years, whilst the fourth period included a number of bad seasons, the adverse influence of which the constantly increasing accumulation of manure within the soil only very partially obviated. It will be observed, too, that the amount of straw, the excess of which is a sure sign of excess of manure and over luxuriance, upon the whole increases rather less than that of grain, there being less straw over the third period, with the highest produce of grain, than over the second with a lower produce of grain, whilst the fourth period gives considerably less than either the second or the third. This is the more remarkable since the annual application of 14 tons of dung will have annually brought upon the land the equivalent of from three to four tons of straw. The fluctuations in the produce of straw, as well as in that of grain, further illustrate the influence of season in spite of the accumulation of manure.

"Turning to the experiments with barley, we have, upon the whole, very accordant results over the three periods, compared with the same three periods with wheat. Thus, the last period but one, which included a number of very good seasons, gave more produce than the last period, notwithstanding the greater accumulation of manure in the later years. There is in the barley, too, as with the wheat, no striking increase in the production of straw; for although there was considerable variation in the proportion of grain or straw in individual years, according to season, the average proportion is almost identical for each of the three periods. It is, then, obvious that there is no increase of produce of either wheat or barley over the later years, at all commensurate with the increased accumulation of manure in the soil.

"You will doubtless be interested to know something of the after effects of these great accumulations of dung in the soil, seeing that they increase the crops so inadequately during the period of the application of the manure. The following table affords information on this point. The two upper divisions relate to barley, and the lower one to meadow hay. After 14 tons of farmyard manure had been applied for 20 years in succession on one plot in the field devoted to the continuous growth of barley, the plot was divided. On one-half the annual application of the dung has been continued now for a period of seven years more; whilst the other half has been left unmanured, also now for seven years. In the experiments on meadow hay, the application of 14 tons of farmyard manure per acre per annum was continued for eight years; and the land has since been left unmanured for 15 years. The table shows the produce of barley, grain and straw,

and of hay, during the periods of the application of the dung, and after the cessation of the application. It also shows the increase over the continuously unmanured produce over the respective periods.

SHOWING THE EFFECTS OF THE UNEXHAUSTED RESIDUE OF FARMYARD MANURE.

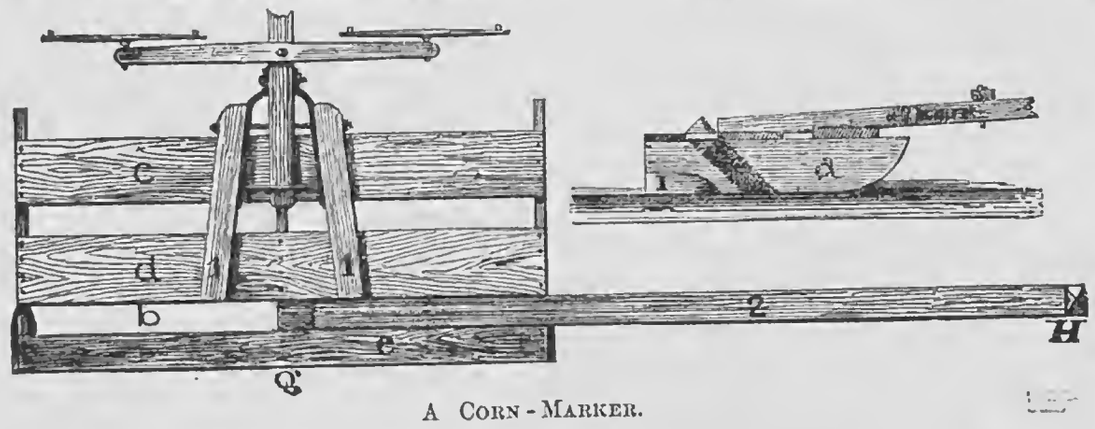
	Av. per acre per annum.	
	Produce.	Increase over continuously unmanured.
Barley Grain.	Bushels.	Bushels.
20 years, 1852-1871, 14 tons farmyard manure every year	48¼	28¼
7 years, 1872-1878, 14 tons farmyard manure every year	49⅛	36
7 years, 1872-1878, unmanured, after 20 years farmyard manure	36¼	22¾
Barley Straw.	Cwts.	Cwts.
20 years, 1852-1871, 14 tons farmyard manure every year	28¼	16½
7 years, 1872-1878, 14 tons farmyard manure every year	29⅞	23
7 years, 1872-1878, unmanured, after 20 years farmyard manure	20¼	13⅜
Meadow Hay.		
14 tons farmyard manure every year, 8 years, 1856-1863	42⅞	19⅛
Afterwards unmanured, 1864-1868	40⅞	19⅝
Afterwards unmanured, 1869-1873	29⅜	10⅛
Afterwards unmanured, 5 years 1874-1878	23¾	6¾

"It will be seen that there is an average of only 1¼ bushel of barley grain and 1½ cwt. of straw per acre per annum, more over the last seven years than over the first 20 years, where the application of the dung was continued. Where the dung was discontinued after 20 years, the produce of grain was, over the next seven years, not quite three-fourths as much, and that of the straw but little over two-thirds as much as where it was continued. The average annual deficiency was 13¼ bushels of grain and 9½ cwts. of straw. Compared with the continuously unmanured produce over the same periods (which, however, declined considerably over the later years), it is seen that the annually applied dung gave an average increase, over the first 20 years of 28¼ bushels of grain and 16½ cwts. of straw, and over the last seven years of 36 bushels of grain and 23 cwts. of straw. And where the dung was discontinued over the last seven years, there was an average increase of nearly 23 bushels of grain and 13½ cwts. of straw over the continuously unmanured produce. In the last year of the seven, 1878, the plot where the application of dung was continued, gave 36¼ bushels of grain and nearly 26½ cwts. of straw more than the unmanured plot; and the plot where the dung was discontinued gave, in the same or seventh year of the discontinuance, nearly 12 bushels of grain, and nearly 10¼ cwts. of straw, more than the unmanured. It is obvious, therefore, that the residue of the 20 years' application of dung is still yielding increase. It is, however, gradually declining. But there is no doubt that the residue will continue to be effective in a still more declining ratio for many years to come. It would, indeed, take considerably more than a century at the present rate to recover in increase of produce all the nitrogen of the manure, which has not yet been so recovered.

"Turning now to the results obtained with meadow hay: as already stated, 14 tons of farmyard manure were applied per acre annually for eight years in succession, and the produce has since been taken for 15 years without manure. The table shows the average annual produce and increase of hay over the eight years of the application, and over the first five, the second five, and the third five years afterwards. It will be observed that over the 8 years of the application the average produce of hay was nearly 2 tons 3 cwts.; and the average increase over the continuously unmanured produce was not quite 1 ton. Over the first 5 years after the cessation of the application, the average produce was about 2 cwts. less; but, substantially, both produce and increase averaged much about the same as over the 8 years of the application. Over the second 5 years, the produce diminished to less than three-fourths as much as over the first 5, and the increase was little over 10 cwts. of hay per acre per annum. During the last 5 of the 15 years, the produce was little more than half as much as its original amount, and the increase over the unmanured produce of the same period was not quite 7 cwts.

During the eight years of the application of the dung there were obtained, in all, 17 tons 3 cwts of hay, corresponding to 7 tons 13 cwts. of increase; over the next 15 years there were obtained 23 tons 7½ cwts. corresponding to 9 tons 2½ cwts. of increase, due to the residue of the previously applied dung. Here, as in the case of the barley, it would require very many years to recover anything like the whole of the yet unrecovered residue of the previously applied nitrogen of the farmyard manure.

"Looking to such results as the above, relating to barley and to meadow hay, it is not difficult to understand why a tenant who has been farming highly for a number of years should endeavor to get out some of the residue of the manure which he has accumulated in the land before he leaves it. But if so small a proportion of the constituents of the manure is recovered in the increase of crop during the years of the application when dung is very liberally used, it is not so evident that higher farming, which means more dung, should be a remedy for lower prices. Nor can I understand why the so-called "lasting" effects of dung should be considered such a merit. The Rothamsted experiments with various crops, agree in showing that a given amount of constituents supplied in dung, does



A Corn-Marker.

less work, and takes a longer time to do it, than when supplied in any other form.

Experiments with Artificial Manures.

"The next illustrations will show the comparative effects of moderate and of large amounts of artificial manures. In the upper division of the table we have the average produce of wheat, both grain and straw, over 27 years—by the complex mineral manure used alone; by the same mineral manure and 200 lbs. ammonia salts; by the same and 400 lbs; and by the same and 600 lbs. ammonia-salts. In the lower division of the table is given the average produce of barley over six years—with superphosphate of lime alone; with superphosphate and 200 lbs; and with superphosphate and 400 lbs. ammonia salts.

SHOWING THE EFFECTS OF MODERATE AND OF LARGE AMOUNTS OF AMMONIA SALTS.

	Average per acre per annum.	
	Dressed Grain.	Straw.
Wheat every year, 27 years, 1852-1878.	Bushels.	Cwts.
Complex mineral manure, alone	15¾	13½
Complex mineral manure, and 200 lbs. ammonia-salts	24½	22¾
Complex mineral Manure, and 400 lbs. ammonia-salts	33¼	33¾
Complex mineral manure and 600 lbs. ammonia-salts	36¾	40⅞
Barley every year, 6 years, 1852-1857.		
Superphosphate, alone	31⅝	16½
Superphosphate, and 200 lbs. ammonia-salts	45⅛	28¾
Superphosphate, and 400 lbs. ammonia-salts	49⅝	34

"Referring first to the wheat, it will be observed that by the addition of 200 lbs. of ammonia-salts per acre per annum to the mineral manure, an average increase of nearly nine bushels of grain is obtained. By the addition of a second 200 lbs. in all 400 lbs. of ammonia-salts, there is a further increase of the same amount; that is, nearly nine bushels. By the addition of a third 200 lbs. in all 600 lbs. of ammonia-salts, there is a further increase of only 3½, instead of nine bushels. In like manner the first 200 lbs. of ammonia-salts give 9¼, the second 11, and the third only about 6½ cwts. increase of straw. Now, assuming that the application of 400 lbs. of ammonia-salts was the limit of high farming with profit with wheat at 6s. per bushel, I cannot see how it could be maintained that a further 200 lbs, yielding little more than a third as much increase as when used in more moderate quantity, should be employed because the price of wheat was reduced to 5s per bushel. On the contrary, the conclusion I should draw from the results of these experiments is, that the application of the 600 lbs. of ammonia-salts could only be profitable if the price of wheat were to rise instead of to fall.

"Again, it will be seen that in the case of the barley, the addition to superphosphate of lime, of 200 lbs. of ammonia-salts gave an average increase of nearly 14 bushels, whilst by the addition of a second 200 lbs., in all 400 lbs. of ammonia-salts, a further increase of little more than four bushels was obtained. It will be observed, however, that whilst with the increase of 14 bushels of grain there was an increase of only 12 cwts. of straw, there was with the further increase of four bushels of grain an increase of 5½ cwts. of straw, or a much larger proportion of straw to grain in the increase by the second than in that by the first 200 lbs. of ammonia-salts. It was, in fact, so evident from the bulk, and the laying of the crop, that 400 lbs. of ammonia-salts was an excessive application, that, after its use for six years, the experiment was abandoned. Here, again, I think it must be evident that it would be higher, and not lower prices, that would justify the higher standard of farming.

Inferences.

"From the various results which I have laid before you, you will have gathered that when farmyard manure is used, and even, though in a less degree, when manure is deposited on the land by animals feeding upon it, there is less immediate increase for a given amount of constituents supplied, and more accumulation within the soil, than when certain artificial manures are employed. You must not suppose that, in bringing this fact prominently to your notice, I wish in any degree to depreciate the importance of, so to speak, natural manures, and to exalt that of artificial manures. The production, and the use, of farmyard manure, are a necessity of the general economy of a farm; and there must be the more of it produced, or at any rate the more of animal manures, the greater the amount of meat produced. Nor would it be possible to rely mainly on artificial manures. I do think, however, that farmers generally do not sufficiently recognise the slowness of the action of the natural manures of the farm; and that, so far as they do so, they frequently even look upon it as a merit rather than otherwise, that it should be as they say, more "lasting." But slowness of action means slowness of return for the outlay; and this will be the greater the more excessive the amount of the manure applied. In my opinion, the object to be attained, and that which I have no doubt will characterize the most successful farming of the future, is to get as quick a return as possible for the outlay in manures, whether natural or artificial. This can only be fully accomplished with freedom in the growth and sale of that produce which is the most profitable, the selection of the crops which are the most suitable to the soils and seasons of the locality and the demands of the market, and such a judicious adaptation of natural and artificial manures to the crops to be grown, as to obtain the maximum increase of produce, with the minimum residue left unproductive in the soil, and subject to loss by drainage and in other ways.

To sum up.

in regard to this first branch of my subject:—It has been shown by reference to the results of experiments on an ordinary four-course rotation with different manures, in some cases carting off the roots, and in others consuming them on the land, that beyond a certain limit, the increase of produce was not commensurate with the increase in the amount of manure accumulated within the soil. The next illustrations showed that, when farmyard manure was used in excessive amount, for the direct growth of either wheat or barley, the increase of produce by no means corresponded with the accumulation of manurial constituents within the soil; that, notwithstanding an increasing accumulation from year to year, the crops even diminished in the later years under the influence of bad seasons, the increased amount of manure in the soil not fully compensating for the adverse influences of the seasons; and lastly, that the unexhausted residue of the previously applied dung, though yielding a considerable increase for many years afterwards, did so in a rapidly decreasing ratio, and only in such proportion that it would take very many years to recover the manure applied; even if, which cannot be supposed, it were ever fully recovered. In like manner it has been shown, that when artificial nitrogenous manures were used in gradually increasing amounts, the amount of increase obtained for a given amount of manure employed, very greatly diminished when the quantity applied exceeded a certain limit, which may be called the standard of high farming; so that, a given quantity of further increase was obtained only at a greatly increased proportional cost for manure.

"The general and uniform result of the whole is, that, whether we go from high to still higher farming with an ordinary rotation of crops, with large amounts of farmyard manure applied year after year for the growth of grain, or with artificial manures in gradually increasing amounts, less increase of produce is obtained for a given amount of manure applied, the greater the excess of it over what may be termed the standard of moderate high farming."—Concluded next week.

A GOOD CORN MARKER.

Every man has his hobby to ride. I have several and one that I frequently mount is the "Common-sense, bee-line, home-made, reversible corn-marker." Take three pine or hemlock planks 2x8, 3½ ft. long, round one end as shown at a. Place them 3½ ft. more or less, as is desired, apart, and spike on in front a plank (of some light wood) 10 inches wide, two inches thick. About the middle spike on a second one which may be a little thinner.

On the rear end nail a piece of hard pine (or some wood that is fairly substantial) c, six inches wide and 1¼ inch thick, leaving the space (b) five inches wide. Two pieces of 3x4 inch

scantling, slightly thinned at the back end (1, 1) spiked or bolted on, (see d), will make hounds for the wagon tongue or one made for the purpose. The tracker (2) is made of some substantial wood 4½ inches wide and 1¼ inch thick and if the rows are to be 3½ ft. apart, it would be 10½ ft. from g to h. Fig. 4 shows an end view and 5 a side view of the outer end of the tracker (2), as seen at H. The tracker 2 is armed on either side with two beveled blocks bolted on the outer end, and at the inner end with reversible hinge (6) which enables it to be turned from side to side.

If it is desirable to have the furrow wider than the 2-inch runners will make it, a small chamfered inch block may be nailed to either side.

The rear view is at 3, the side view at I, the front end of the runners, should be made sharp laterally and covered with small pieces of sheet-iron.

How to use it: Set three or more stakes and drive once across the field *straight*, with the tracker extending fieldward; at the end reverse it; let the driver stand on the marker at (g). This places him immediately in line with the mark the tracker makes, with the tongue of the implement, and with the center runner. No stakes, no bother, no crooked, or alternately narrow and wide rows, but everything lovely and workmanlike. The one we now have has been in use five years and was made by a student and myself in just two and a half hours. A "one or two marker," is too slow. In a "four or five" one the outside runner is so far from the center of draft that the least obstruction readily turns it aside. I have used a five marker but I never could make a mark that the sun did not warp badly before I reached the other end. But with the one I have described any man or boy that could not draw a "bee line" should be sent to Congress or study law.

I. P. Roberts.

The Garden.

NOTES FOR THE GARDEN.

Death to the Currant Worm.—As the season is now at hand when the currant worm makes his annual visit, it may be of interest to Rural readers to know that the remedy it gave a year ago is both effective and cheap. As some may have overlooked it, I repeat it: To one pailful of wood ashes add one quart each of white hellebore and flowers of sulphur; mix thoroughly—apply by sifting on the bushes. I used nothing else on my plantation of over two acres last season, and want nothing better.

When the Wilson Albany Strawberry is in full bloom, then apply the Codling-moth bands to your orchards. Our most careful fruit-growers think the practice pays. Examine the bands fortnightly to destroy the larvæ of the moth. Many growers use two bands: one near the branches, the other near the root. They find that two bands are a better protection than one.

H. T. J.

Rochester, N. Y.

Coal Ashes.—To those on heavy soils coal ashes will be found an invaluable fertilizer. Their effect, though entirely mechanical, is marvelous and lasting. I find them fully equal to their weight of stable manure. Those who have no other use for their coal ashes can use them to advantage in filling in low spots on the road. They are almost equal to gravel for this purpose.

Keep the Cultivator going in the corn field. It will pay. Frequent stirring of the soil keeps it moist—unlocks the fertile elements so as to be available for the young plants, and keeps the weeds down. To destroy the weeds before they come up, may seem a paradox, but if followed as a rule of practice, it will save the farmer many a dollar.

The Mildew on Gooseberries has discouraged many from planting the choice kinds. A liberal mulching of coal ashes around the roots of each plant, will do much towards warding off this difficulty—and, in many instances, will remove it entirely.

Why are the apple orchards so full of blossoms? Last year was the "bearing year" hereabouts, and yet many of our orchards that gave us their heavy crops promise a bountiful yield this season.

Insect Pests.—If not already done, destroy the nests of the Canker worm in your apple orchard now. Don't delay the job.

Miscellaneous.

VAN'S VIEWS

On Milch Cows.

We have been in the butter business for several years, supplying private families in town, delivering it either once each week or every other week. We have always got the top price and had no complaints. The demand was greater than we could supply, and we often had to send our customers to others. Last year there was a change. We lost our best customers. I did not believe there was a better butter maker than mother in the county, and I don't believe it yet.

I discovered the secret very soon: the man who cut us out of our trade had a herd of Jerseys and their grades. His butter is better than ours. I own it and our own family all own it. If Jersey butter cuts us out in the local market, how long will it be before it will cut out other butter in the general market? We have a class of enterprising farmers in the butter business in this State, as New York men know to their cost. They will soon take advantage of the fact that Jerseys make the gilt-edged butter.

But cheese? You have me there, you think? Well I never made cheese; but one who has and still makes thousands of pounds per year, writes me that "the more Jersey cream and the less Aryshire gristle you have, the better will be the quality of your cheese."

But I keep forgetting! it is milk you are after. I would extend to you the advice my father gave me some years ago. "When you buy a cow, buy one that gives *milk*, it is much easier to pump water into your pail than it is to draw it from a cow's bag." If you consider that Jersey milk is in danger of hurting your customers' stomachs by its richness, do as the proverbial milkman does. Is it more dishonest to water after it leaves the cow than before?

Fodder Corn.

My back aches and my hands are stiff from finishing sowing my fodder corn. It is a favorite crop with me, and I believe—I have no means of weighing and cannot tell exactly—I can raise seven tons per acre. I use Pratt's Early sweet corn and drill with a Planet Jr., in rows two and half feet apart. Cut when it silks out and tie in large stooks and leave till wanted for use: what is wanted for use while green, is cut and allowed to wilt a few hours before feeding "When my ship comes in" I mean to have a large hay cutter with a carrier, to run by horse or steam power and cut my fodder, mixing it with rye straw as I feed it in the machine, and hoping that so stowed it will keep safely.

Tent Caterpillars.

are a nuisance. I have been burning them out all the week, but they are "not all dead yet." It is going to be "war to the knife" if I have to cut the throat of each individual caterpillar. If I had been as good a student as I should have been, I would have known how to find them before they hatched out, and by destroying them then have saved much trouble.

We need rain the worst way in the world. Wheat looks thin, oats are yellow, corn can hardly stand alone and my plum orchard I have just set out, looks as if it didn't like things very well.

Brown Co., Wis.

SHEEP vs. DOGS.

Dogs! dogs! At last I am disgusted. On every side we meet a dog. People who are so poor that they can hardly get enough to eat, must have at least one worthless cur and often two or three, notwithstanding the tax which they must pay; but the tax is not half high enough. It should be so high that a poor man who has no earthly use for a dog, would kill it rather than pay the tax; and if a man has a good dog and a use for him, he can afford to pay a higher tax than fifty cents.

In some places sheep husbandry has been nearly abandoned on account of these worse than worthless dogs. Now, I claim that it costs no more to keep a sheep than to keep a dog, and if the dogs were disposed of and their places taken by sheep, some profit could be had. In the rural districts at least, any one who keeps a dog could keep a sheep, and if this change were made we should hear far less of hydrophobia and its terrible results, to say nothing of the many accidents caused by horses getting frightened by a dog running out and barking at them.

Perhaps I may provoke the ire of some reader, but I can't help it. It can not be disputed that there are far too many dogs, and many evils in consequence, and I say let the number be reduced. F. H. D.

CATALOGUES, &c., RECEIVED.

Mr. Peter Leclair, of Winooski, Vt., sends us pedigrees and particulars of his herd of pure-bred Jersey cattle, imported from acclimatized English stock. Mr. Leclair believes this stock to be superior because it is from fine Island cattle in the first instance, that have been imported into England, and there carefully bred and improved by experienced and intelligent breeders.

The annual meeting of the American Nurserymen's Association will this year be held in the new court house at Cleveland, Ohio, commencing June 18, and continuing three days. There will be interesting papers by well-known men, and altogether a spirited meeting is anticipated.

Industrial Implements.

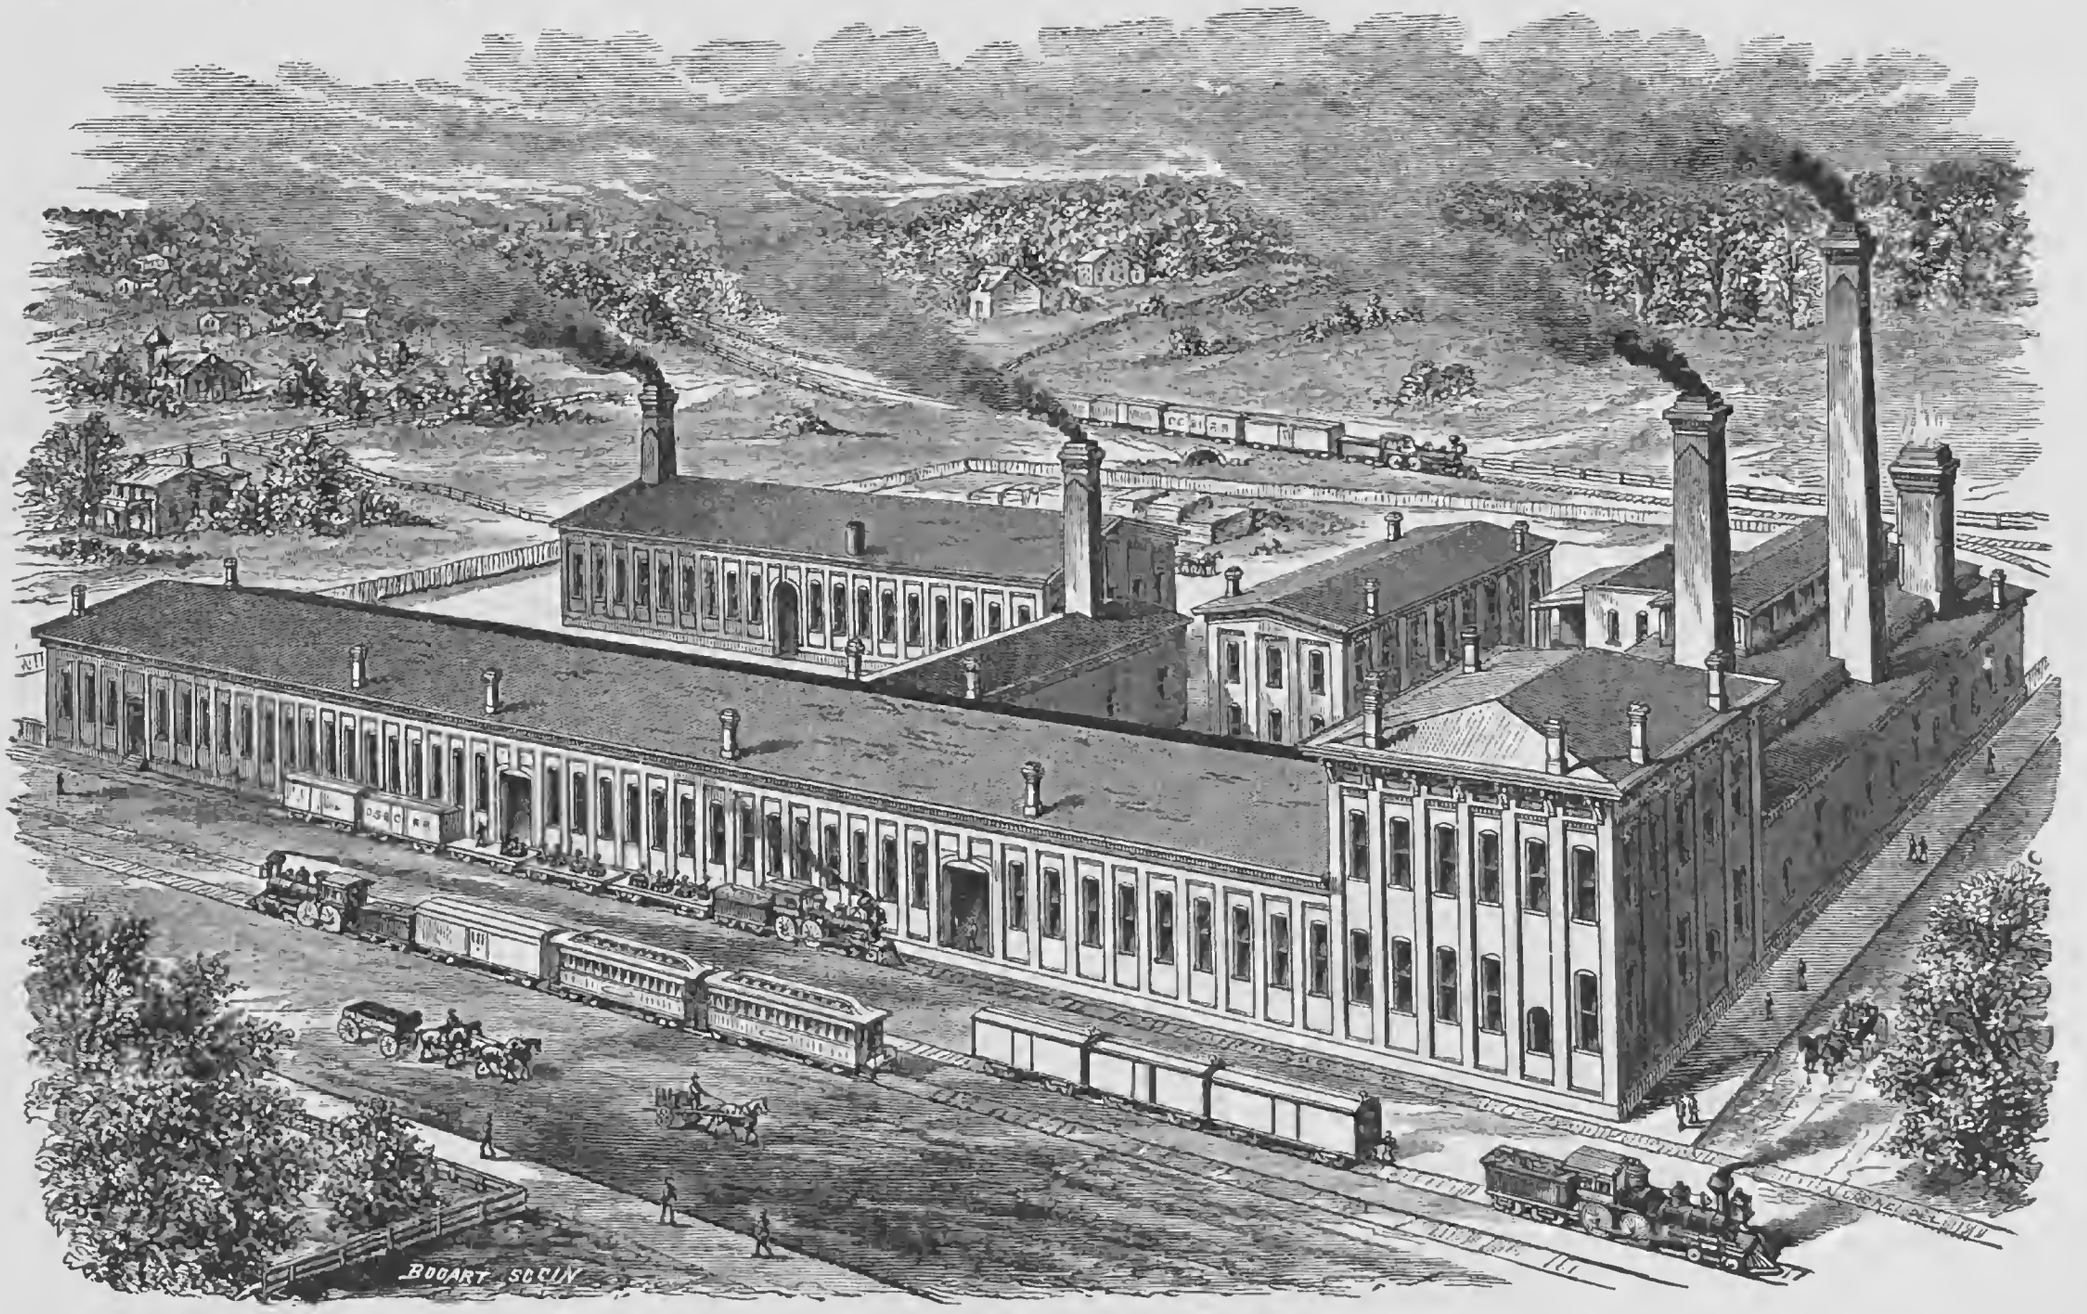
THE NEW SHOPS OF JAS. LEFFEL & CO. AT SPRINGFIELD, OHIO.

The measure of the growth of manufacturing industries is clearly marked by the extent and completeness of the shops in which the business is transacted. Not often are spacious works and an expensive plant, among the first liabilities of new concerns, hence then, monumental establishments, as asserted, are marks of the rising tide of prosperity.

We give, this week, a handsome illustration of the new works of one of the largest firms in Springfield, Ohio,—a place quite noted for its manufacturing industries. The structures cover several acres of ground. The main building is occupied principally by the machine shop, and the "L" contains the foundry. Besides these, there are large pattern shops, blacksmith shops, core rooms, and offices; as well as projected boiler shops, etc., which are detached from the main building. These works form probably the most extensive and thoroughly equipped establishment in the world for the manufacture of water wheels.

The heavy nature of much of the work done by the firm renders it desirable that most of the shops be on the ground floor; a portion of the main building, pattern shops, etc.,—is, however, two stories high. All the departments have ample capacity, are conveniently arranged, and well lighted. There being no available water power suitably located, the power is furnished by an upright double engine. The works are furnished with unusually fine railroad facilities—much better than heretofore possessed inside the city. The trunk line of the C. C. C. & I. Railway passes the door at one side, and the C. S. & C. Railway runs the full length of the shops on the other. In addition there are special side-tracks owned by the firm, all furnishing the most admirable facilities for expeditious loading and prompt shipment.

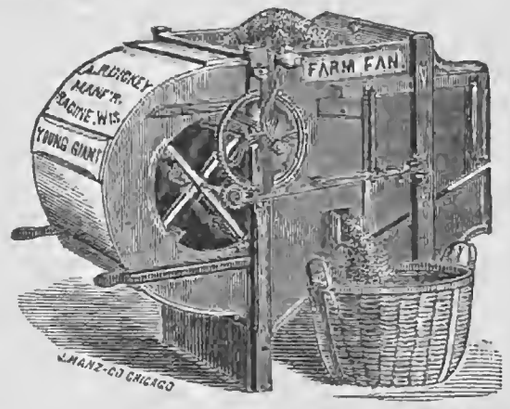
This large area is devoted mainly to producing the two notable products of the firm, the Leffel Turbine Water-wheel, and the Brookwalter engine, both of which are known favorably over a wide extent of territory. These new works with improved facilities, and the low price of the raw material, have enabled the firm to add to the excellence of their work, while at the same time reducing the cost. Price lists and descriptive matter may be had by the interested reader.



New Shops of Jas. Leffel & Co., at Springfield, Ohio.

DICKEY'S FANNING MILL.

While some machinery is valuable because it economizes labor, there are other kinds whose use increases the value of the product



treated. Fanning mills are included in the latter class. A good farm fan mill not infrequently adds as much as five cents per bushel to the price of grain by putting it into cleaner and better shape for market. When the profits have to be calculated so closely as at present, the margin of gain may lie entirely in such saving. The farm fan illustrated this week, is made by Dickey & Pease of Racine, Wis. M. A. P. Dickey is a pioneer in this branch of manufacture and the works at Racine, which have just been enlarged to meet the extra demands made upon them, are among the most important in the country. The mills are made in nine sizes, adapted to all wants, and have a capacity of from 40 to 400 bushels per hour. Extras for cleaning small seeds are supplied additionally. The favor with which this fanning mill is received may be judged by the statement that, in one week, orders were filled and shipped to nearly every Northern State, to California, Montana, Colorado, Texas and New Mexico, as well as to Scotland. But a short time since 26 were sent to Australia. For over forty years Mr. Dickey has been in this business, and it has grown steadily until at the present time, two hundred fanning mills per week are required to meet the demand.

The Lane and Bodley Co.'s farm Engine has many merits that strongly recommend it to farmers and thrashermen. The workmanship is very thorough, and the design combines many good points. The maximum amount of power to be obtained by the least amount of fuel has been one of the chief ends of the constructors. The engines are carefully tested before being delivered to purchasers, and the boilers are insured for one year. Their descriptive pamphlet will be sent on application.

Everywhere.

NOTES FROM NORTH CAROLINA.

This county has a large quantity of grain and cotton planted. The rains have been most timely and not too frequent or heavy. Corn is doing excellently, has a fine stand, is clean, and, to show the stage of its advancement, one farmer about 1¼ mile from Lowell, is getting ready to "lay by" one field. Wheat, oats, etc., will make fair crops; no rust, weevil or insect of any kind. The grain crops would be very full, but for a strange practice our farmers have of pasturing their grain fields all during the winter and until late in spring; for here all small grains are sown between September and Christmas, and out-of-door farm work done every month in the year. Now, if a people expect a grain crop to support animal life half the year while it is growing, they ought to expect short returns for bread findings for humanity. Still, with all this and the shallow plowing, want of cultivating and keeping lands in order, the yields are very fine—wheat will yield over 12 bushels per acre. Cotton fields are all clean; the plant is in healthy condition and is considered safe. The fruit crop was injured by a late frost, and peaches will show perhaps one-third of a crop. The lands about here are cheap and fertile, and the owners desire an infusion of good, working, self-sustaining Northern people who have some means to start with. By working lands here to anything near the extent and way the farmer North does, he cannot fail to lay up a competency. There are now at Lowell two cotton mills, employing over 300 people. These are operated by water power, there being two dams; that is, two powers now in use, either of which is, by demonstration, a better power than the water power at Rochester, N. Y. There are several Northern families now settled at Lowell and in the vicinity, and the change in the appearance of things is manifesting itself. Some neat six-room cottages are being erected, and the owners of the place own the mills and some 1,500 acres of land, and want a diversity of industries.

A cooper who could make a *good* barrel would find a place here where he could sell more ware than he could make, and get cash for his work. There is not a cooper within 70 miles, and cooper's ware is in demand. Timber, of all varieties, is plentiful; oak, ash, pine, hickory, walnut, etc. A good blacksmith who could and would do repair and job work, and who could turn his hand to machinery repairs occasionally in the mills, would find a good, paying business, which would grow. Also a good wagon maker, who would repair wagons, make and repair woodwork of plows, harrows, etc., will find a fine field. Some one who would make spokes, rims, felloes, etc., can be guaranteed a market for his product, abundant material to work on, and good terms as to room and power for his machinery. A woolen mill is needed, and by no means the least worthy of consideration is the making of spools, shuttles, bobbins, etc., for within a radius of eight miles, are four cotton mills besides the two at Lowell, and all these send North for supplies, when the material and power is here on the spot, and within a radius of 40 miles are over 15 cotton mills, all making money, and running night and day. Mill-hands' wages are lower than at the North; but living is cheaper, and no one is extravagant. Building lumber ranges from $8.50 to $10.50 per 1,000 feet, while fine building granite can be had for but little more than the cost of quarrying. Lowell is on the Air Line Railway, 16 miles from Charlotte, has a good depot and store, and a rich country. Lands are cheap; the cotton manufactory has been in operation 27 years; a new mill was finished a year ago. The place and country are very healthful, the days are not too hot, and the nights are always cool and refreshing. GASTON.

Lowell, Gaston Co., May 29th.

RURAL SPECIAL REPORTS.

OHIO, Painesville, June 3.—We have had a sadly dry time hereabouts, and farmers are much discouraged. In view of the probably short crop of hay, farmers will do well to sow a few acres of corn fodder. Hungarian grass is another good substitute for hay and can be sown as late as the 20th of June, though from the 10th to the 15th is better. It is a very sure crop and easily grown, sown like wheat or oats. Grape vines need attention at this season, not only to keep the young shoots well tied up, but to prevent their growing so thickly as to exclude air and sunshine. On examination it will be found that two or three shoots often start from one bud, and in such cases only the strongest one should be left to grow—the others be nipped off while quite young and brittle. After another week or two it will be time to commence thinning off the clusters of blossoms, as the majority of vines incline to bear twice as much fruit as they can well bring to maturity. Wheat is badly injured by the drought, beginning to head with very little stalk. Many fields, it is thought, will hardly pay for harvesting, and with good weather hereafter the average cannot exceed one-half a fair crop. Grass is suffering badly, especially old meadows and pastures. Those of recent seeding will do fairly if good rains come soon; but the hay crop must be light, perhaps half an average. Oats have come up poorly except the earliest sown, and all are backward; with good rains they may yet come on and make nearly a fair crop. Corn, on the best soils, where planted early, came up fairly and may yet do well, but the majority of fields have not come up, and much of the seed has perished after sprouting, hence the land needs to be replanted immediately. M. B. B.

NEW HAMPSHIRE, Winchester, June 2.—We have just had a few very hot days, the mercury being in the neighborhood of 100° some of the time. Peaches promise well, every tree being in full bloom; so are most of the apple, pear and cherry trees, etc. Potatoes are selling for $1.40 per bushel. A good many have been planted; some are up six inches. Considerable planting has yet to be done. Vegetation has grown rapidly and the season comes as early as usual. The Azalea nudiflora is especially noteworthy, with flowers of various shades of pink and deliciously fragrant. Leaving out the Rhododendron, that grows in only two places here, this Azalea is undoubtedly the finest flowering shrub in New Hampshire, and it is a wonder that it has not been introduced into cultivation extensively. It grows some six feet in hight, and is naturally of a roundish form in open places. This is said to be the only species found in this State. Of herbaceous plants, in May, Trillium erythrocarpum, or the Painted Birthroot, takes the lead. The Painted Trillium is a name well given, as all will note who see it in its native haunts. Corallorhiza innata is a rare orchid that I have found here; another rare plant is Mitella nuda, with green, pinnatifid petals, found in a swamp. Plants and flowers have a freshness here unknown further south. Blueberries promise a large crop, and so do Raspberries, Blackberries, Strawberries, etc. At Northfield, in the Connecticut Valley, a few miles from this place, Blackberries are in bloom. The valley presents a vivid contrast to this section, which is made up of steep hills and small mountains, making it a delightfully picturesque summer resort. E. S. W.

NEW YORK, Elmira, June 2.—Chemung Co. farmers have found little in the weather to encourage them this spring. The season has been cold and backward, and for the past month the weather has been very dry, which has been decidedly unfavorable to growing crops. We had but one shower during May, and wheat and spring grains are suffering through the lack of rain. Winter wheat was generally sown late last fall, and, as the weather was dry, it made but little growth before winter. In consequence of this and the cold, dry spring, the wheat crop will be light in this part of the State. Oats, barley and spring wheat are backward, owing to the protracted cold, dry weather. On the nights of May 21, 22, 23 and 26, respectively, we had hard frosts, which did considerable damage, especially to the fruit crops. Corn and potatoes were cut back, and young seedings of clover and timothy are injured in places. Grass is making slow growth. Old meadows will certainly produce sparingly. The high prices received for potatoes last fall and winter have been the cause of a large amount being planted this spring, and if the season is favorable, the crop will doubtless be large and the price low. Tobacco-growers are anxiously waiting for rain, so that they can set their plants. It is estimated that one thousand acres of tobacco were cultivated in this valley last year, and the high prices realized for the crop will cause an increased acreage for the present season. Probably 1,500 acres will be set to tobacco this year. Some attention is being paid to the subject of sugar from beets, and many farmers are planting a small quantity of beet seed by way of experiment.

G. A. G.

NEW YORK, Syracuse, June 2.—We are having a severe drought in this vicinity. During the month of May no rain fell, except a few slight sprinkles, hardly enough to lay the dust. The ground has not been wet down an inch since the middle of April. As a consequence, everything is suffering for rain. Determined to save my strawberry crop, I bought a force-pump and watered the plants well, but on the 23d and 27th we had severe frosts that killed at least one-half of my crop, so that, with the drought and frost, one will earn his strawberries this season. My pump will fill a barrel in four minutes, works easily, but still it is no light task to water an acre or two of Strawberries. Mulch is the cheapest and best remedy against drought. The frost injured my Grapes badly; 400 vines, set last year, look as if a fire had passed over them—not a green shoot or leaf is left. I am fearful that many of them will never grow again, and as a number of them cost me $1.50 each, it is rather disheartening. Plums, Pears and Cherries generally escaped the frost, and will be a good crop. Apples, for the "off year," blossomed very well, and we shall have a partial crop. Grass, wheat and corn look poorly, and the potato crop is not as well advanced as is the crop of potato beetles. N. R.

FLORIDA, Tallahassee May 27.—We are having a good season for working crops. The increased price of cotton has helped the hopes of the planter, as at ten cents per pound, it will pay to raise it, but a poor living is made by it at seven cents. This is the country for the poor as well as the rich man. A small farmer showed me a check yesterday for $174.20 received from New York as the proceeds of a shipment of potatoes raised on 1¼ acre, and this after paying freight, commission etc. He has cotton growing on the same land six inches high, and expects to make a bale of cotton worth $50 or $60. Such land can be bought in lots of from 15 to 100 acres at $5 per acre. I saw last week by one train, nine carloads of cucumbers and tomatoes. Roasting ears are plenty and other vegetables a drug. The negro exodus unfortunately has not reached us. Every town has a few hundred idle ones that could be well spared, and should they go, they will be pronounced "true patriots who left their country for their country's good." But I would advise the chickens to roost high where they settle. A SUBSCRIBER.

RURAL FARM, Queens Co., L. I., June 6.—Too much rain. The Blunt corn plot much injured. Cool, windy weather. Now is a good time to pull up wild radish from oat fields, etc., while it is in bloom. It is impossible to do so after the yellow petals fall, when the plants, being of about the same hight as the oats, can no longer be determined. Pearl millet has made only about two inches of growth. Looking at these slender blades now, it seems impossible that they should grow with such wonderful rapidity and vigor a little later. The rows of Doura are now well marked, and the plants are four inches high. Wheat is looking magnificently. A large hay crop is assured. Dr. T. H. Hoskins, of Newport, Vt., has just left us, after a visit of two days, the pleasure of which was greatly marred by almost incessant rain. While, however, he saw less of the Rural Farm and very little of the experiments we are carrying on, we had a better opportunity of listening to the results of his life's experience, which were freely and very pleasingly imparted.

CONNECTICUT, Berlin, June 3.—The spring was quite late, but vegetation is coming forward very rapidly now. Pear trees gave promise of the greatest yield for years; apple trees, for the non-bearing year, promised well; but heavy frosts on May 9th and 10th injured fruit very much, and, excepting in sheltered localities, fruit will not be abundant. The small fruits suffered some, also wild berries. Grass looks well on rich upland, but on low grounds it will be very light. The currant worm and potato bug are very abundant; so, also, are other injurious insects, except the "tent caterpillar," which is not frequent this year. The frost referred to, injured potatoes, corn, beans, etc., very much, and some have planted their fields a second time. The dry spell, following the frosts, prevented the corn in some fields from coming up, so that has to be planted over. IPSE.

NEW YORK, Whitney's Point, June 3.—May has been cool and dry—only two light falls of rain during the month. Oats were sown from the 1st to the 10th; potatoes planted from the 10th to the 17th; corn, from the 17th to the 31st. Cherry trees are in full bloom; apple tree buds bursting. Light frost on the 22d, 23d and 24th; no damage done to fruit. On the 27th there was a hard frost—ice froze ¼ inch thick; fruits of all kinds were damaged. Sprouts, three inches long, were frozen on grape vines; ash and chestnut trees look as if they were burnt with fire. Oats look very badly, owing to the drought. Grass is very backward, and unless we have plenty of rain during this month, the hay crop will be very light, especially on the hills. Eggs cost at the door 10c. per doz.; potatoes, 50c. @ 65c. per bush.; hay $9 @ $10 per ton. Corn and potatoes just coming up. M. B. B.

PENNSYLVANIA, Wallsville, Lackawana Co., May 29.—The weather has been quite cold for this time of the year—three frosts last week and another four days ago; neither of them, however, were severe enough to do much damage. Pears, Peaches, Cherries and small fruit are in full blossom; Apples, however, are not so far advanced as the others. Corn and potatoes are nearly all planted. Grass and oats look well. But little winter wheat is sown hereabouts, but that little looks well, especially that sown early. The wholesale prices at Scranton, about 15 miles south of this place, are: corn, 56c.; oats, 45c.; potatoes, $1; butter, 13c. to 15c.; eggs, 12c. W. E. M.

ILLINOIS, Deer Park, La Salle Co., May 31.—Weather warm, some days reaching 90°F. The recent rains have proved very beneficial, but the hay crop in this section will be scant. Nearly every farmer who planted corn prior to May 10th, had to replant—the weather was so cold and dry that the corn rotted. Cutworms have been very destructive on sod, in some instances cutting down whole fields. Potatoes look well. Rye is headed out and promises a heavy crop. Strawberries are ripening; the Wilson seedling seems to take the lead, having withstood the drought better than other varieties. U. S. E.

N. Y., Corning, May 28.—We are pleased with the articles on cash payments, that have lately appeared in the RURAL. We know of no topic the advantages of which it would be more beneficial to impress upon farmers and others than "Cash" *vs.* "Credit." We are glad to see the RURAL take up the subject, and believe it will do as much good in that direction as if it could show its readers some new and successful method of getting money out of the ground where before they got none.

B. W. P. & S.

CONNECTICUT, Poquonoc Bridge, June 2.—Weather cold and dry; no rain to speak of since the first of last month. We had two severe frosts last week, and farmers claim that considerable damage was done to their crops. What potatoes are up are already attacked by the beetles; the pests will make quick work with the whole crop, if it is not attended to in season. Money is very scarce hereabouts. Corn, 75c. per bush.; potatoes, $1.50; butter, 20c. per pound; eggs, 12c. per doz. M. W.

ALABAMA, Selma, May 29.—The weather here is warm and dry. Crops are suffering from want of rain; yet all are still doing pretty well and folks are hopeful. I began picking strawberries on the 4th of April, and I am picking them yet. My vines are still covered with young ones together with plenty of bloom. Fifteen miles north of here, however, strawberries have already "given out."

J. M.

WISCONSIN, East Troy, May 30.—Weather very dry here. We have had only one good rain this spring. What winter wheat there is here is looking well. Early-sown spring wheat appears poor, but late sown is good. Spring has been very backward. H. A. T.

KENTUCKY, Sherburne, May 26.—The weather here has been very dry; many farmers have planted corn a second and even a third time. The prospect for the wheat crop, however, is fine in this section. C. E. R.

PENNSYLVANIA, Laceyville, Wyoming Co., May 26.—We are having splendid weather. Crops look well except wheat, which was partly winter-killed. Corn is mostly planted.

P. M. L.

NEW YORK, Rochester, May 31.—I deem the RURAL's editorials on "Cash *vs.* Credit," timely and exceedingly good. They "hit the nail on the head" every time. H. T. J.

The Querist.

ANSWERS TO CORRESPONDENTS.

To all Querists.

We are in receipt of numerous queries from persons who sign either their initials or a *nom-de-plume*. It is the regular rule of journals to pay no attention whatever to such communications. The full name and address are always required to insure notice, seldom for publication, but as a guarantee of good faith and for other reasons. For instance, many of the queries signed in this way are not of such general interest as to deserve a place in our columns, while we should be willing to answer them through the mail were the full addresses given. We wish, therefore, that our friends should in future give their full addresses, in writing to us, and thus comply with the rule which all papers have established for very excellent reasons.

Chicory for Coffee — In-and-In Breeding.

U. T. S., Bear Canyon, Colorado, asks, 1, how to prepare chicory for coffee; 2, has it ever been proved that in-and-in breeding of stock is as injurious as is often supposed.

ANS.—As a substitute for, addition to or adulterant of coffee, chicory is largely used both in Europe and this country. For this purpose it is grown extensively in Yorkshire, England, as well as in Belgium, France and Germany, and of late has been largely naturalized on this side of the Atlantic. For the preparation of the article, the old, stout, white roots are selected, and, after having been washed, are sliced up into small pieces and kiln-dried. In districts where this industry is largely followed, the material in this condition is sold to the chicory roaster, by whom it is roasted until it assumes a deep brown color. It is then ground, when, in its external characteristics, it is very much like ground coffee, but entirely destitute of its pleasing aromatic odor. Neither does the roasted chicory possess any trace of the alkaloid coffeine which gives their peculiar virtues to coffee and some other diet drinks. Chemical analysis shows that chicory possesses few elements in common with coffee, and contains very little of the nutritive properties often claimed for it. Where it has been largely used for a long time, it is said to be

injurious to the nervous system. It gives coffee additional color, bitterness and body, and it is claimed by some that as a sedative, tonic and diuretic, it modifies its stimulant and irritant effects. For a hundred years it has been widely used in connection with coffee, and in Belgium its infusion is largely drunk as an independent beverage. In England the sale of a mixture of coffee and chicory is legalized on the proviso that each package be labeled "Mixture of Coffee and Chicory."

The term in-and-in breeding always indicates the breeding of animals closely related; yet no definite rule has been established as to the degree of relationship, in the breeding of animals, to which it should be applied; consequently, almost every prominent writer uses it with a different shade of meaning. The prevailing differences of opinion as to the results of the practice are—to some extent, at least—due to this diversity of meaning. The opponents of the practice claim that it produces a predisposition to disease, a lack of fecundity and a general delicacy of constitution, and bring forward very marked instances of such results, to illustrate their opinions. Sticklers for the practice, on the other hand, maintain that, from Bakewell's days downward, every breeder who has become distinguished for the results of his labors, has invariably largely practiced in-and-in breeding, and found it an effective means towards realizing his ideal. The best opinion, however, at present seems to be that while close in-and-in breeding is inevitable in the formation of improved new breeds, or on the first introduction of old breeds into any new country or section, the continuous use of the practice is unadvisable, as calculated to produce the injurious effects claimed by its opponents. Very much has been said, and very much more will yet be said, on both sides of the question, which is too broad for adequate treatment within the limits to which each topic in this Department must be restricted.

Budding Roses, etc.

M. A. B., address not given, asks the proper time for budding Roses; also, whether Quinces can be successfully grafted, and when. He has repeatedly grafted Quinces in the spring, but the experiment has invariably resulted in failure.

ANS.—Two requisites are necessary for the budding of Roses—a well-matured eye, or bud, and a thriftily growing plant, or stock; they can be budded at any time whenever these can be obtained. The buds of most varieties are generally not sufficiently mature till July; hence it is the practice to bud Roses in the latter part of July and the beginning of August. Inserted at this season, the buds will remain dormant till next spring. Quinces should be grafted in the spring, the same as other fruit trees. If the stock is young and vigorous, the cion mature and the operation properly performed, we see no reason why it should be a failure. Splice-grafting will, perhaps, prove most successful.

Caponizing Chickens.

Rural Reader, again no address, asks, 1, at what age should chickens be caponized; 2, how long will it take caponized fowls to attain full size and weight; 3, what will that weight be; 4, what feed is best to make them grow rapidly. 5, where is the best market for capons.

ANS.—1. Chickens intended for capons may be operated on at any age, but when they are two or three months old is considered the best time. Old birds seldom survive the operation. 2. Capons should be kept to the age of 15 or 18 months, which will bring them to full size and also into the summer months, when poultry usually fetches a good price. 3. The alteration of a chicken into a capon will nearly double the size of what he would otherwise be, in from ten to twelve months. 4. The ordinary diet for fattening poultry. 5. Large cities or special customers in small towns.

Injured Frog in a Horse.

M. G. R., Thoroughfare, Va., has a horse that trod on a sharp stump, badly hurting the frog of one of the hind legs and at the same time painfully spraining the joint, and he asks what treatment should be practiced.

ANS.—If we knew in precisely what manner the frog is hurt, whether it is torn or only bruised, a definite reply could be given. Now it can only be said that the treatment should be such as would hasten the healing of the hurt, either by poulticing the part to remove soreness, or by applying some stimulant, such as compound tincture of myrrh. The sprain should be treated by frequent rubbing with some active liniment, by bandaging, and more especially, rest should be given. If there is much inflammation and swelling in the joint, these should be reduced by frequent fomentations with cold water.

Uses of Beeswax.

J. M. G., Tullahoma, Tenn., asks us to mention the purposes for which beeswax is chiefly used.

ANS.—Beeswax has so large and varied an employment in the arts that it is a difficult matter to say for what purpose it is of most importance. From time immemorial it has been used for wax figures, flowers and ornaments of all kinds; it is used by tailors, sailmakers, shoemakers and others; it is now used extensively for the manufacture of artificial comb foundation; it is used for candles, for grafting-wax and many other purposes.

Miscellaneous.

A. B. C., St. Mary's, Ont., asks how to make Geraniums bloom in winter; she gets an abundance of fine foliage but no flowers. She has also a Cactus which refuses to bloom, although cuttings taken from it produce flowers.

ANS.—Geraniums must have a season of rest during the summer if they are expected to bloom in winter. Keep the plants in pots out-of-doors, under the shade of some tree, till September and water sparingly. In the beginning of September shake the soil from the roots, replant them in rich sandy loam, and bring them forward to the sun and air. Place them in a sunny window, in-doors, when there is danger of frost, and when they begin to grow give them an occasional watering with liquid manure. They need plenty of sun and air and a comparatively low temperature. In a hot room they will not do well. Your Cactus is probably growing too fast. It needs but little water, plenty of sun, and should have a small pot with light soil.

C. H. J., Eddyville, Ky., a philanthropic old gentleman as he is, has taken the trouble to write us a long letter, in which he explains that he has in his possession a recipe for the cure of hydrophobia—a wonderful recipe; he tells of a man who was bitten by a mad dog in 1780, and a single pill made after his recipe cured him, at any rate he never got mad. C. H. J. is now 75 years old, and as he cannot reasonably expect to live much longer, he wishes to "leave this great remedy to the rising generation," and, although it has once been sold for $10, he offers it to us at the very low price of $1, stipulating, however, that we should pay the postage. We are sorry to be obliged most respectfully to decline this liberal offer; but newspaper men are not good keepers of secrets as a general thing, and we fear this one would be lost if put in our hands.

Mrs. C. S. L., Canyon City, Oregon, tells us that bees at that place cost $40 a hive, and being desirous to obtain some, she asks if pieces of comb with young bees can be sent by mail.

ANS.—Bees cannot be sent by mail. A law has been passed forbidding it. They can, however, be sent by express for short distances, if well packed up and the express will agree to take them. Pieces of comb containing unhatched brood, we should think would not interfere with the Post Office law, if the bees do not hatch before they reach their destination.

H. M. S., Iola, Kansas, sends a specimen of a prairie flower for name. She describes it as of a creeping habit, from three to four feet long and blooming about the close of April.

ANS.—It is Schrankia uncinata—(Sensitive Brier). It is a polygamous plant, and the twig sent, bears only staminate flowers.

A subscriber from Alabama sends us a Rose and asks for its name.

ANS.—It is a sport of some Hybrid Perpetual; farther than this we are unable to name it. The garden Roses are so infinitely numerous that it is no easy matter to pronounce with certainty upon any but the best known varieties.

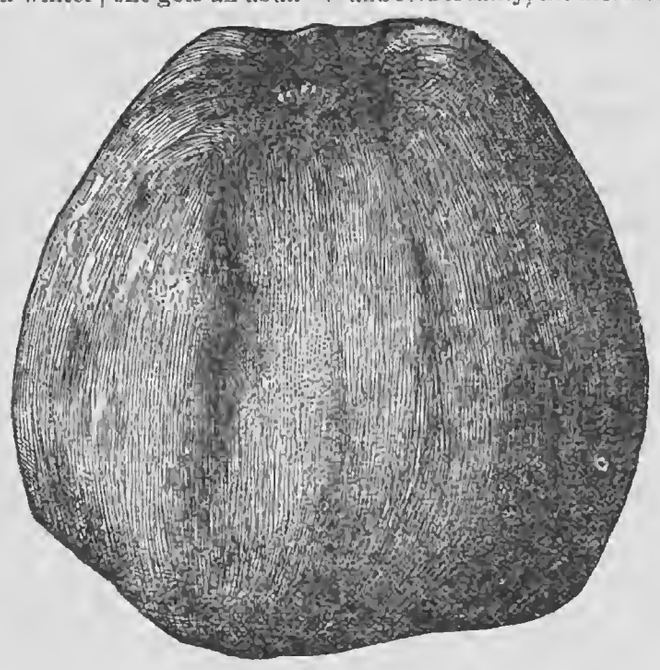
Pomological.

SCOTT'S WINTER APPLE.

THIS apple originated as a seedling upon the farm of Wallace Scott, on the west shore of Lake Memphremagog, about a mile south of the Canada line. This is a very exposed and cold locality, the thermometer sinking often in winter to 30 deg. below zero, and in exceptional seasons so low as to freeze the mercury in the bulb. This tree has proved entirely hardy, and nursery trees grown from it have shown no loss of resisting power in equally exposed situations, where some are now in full bearing. The first grafts from the original tree were made by the writer in 1868. The young trees began to bear, on his farm in Newport, Vt., in 1874, and last season yielded at the rate of two bushels to the tree. Specimens sent to Mr. Downing, and later to Mr. Thomas, met their approval for beauty, but the quality was thought too acid for a dessert fruit. This was also the opinion of the writer until the present season, when it appeared that they had been tested too early. The Scotts's Winter is a first-rate keeper, being fresh and crisp up to the middle of June; and after April 1st it mellows, loses it sharp acid quality, and reveals a brisk, spicy flavor beneath it, which was as much a pleasure, as it was a surprise to those who, valuing its productiveness as well as its early and profuse bearing, had mourned its supposed lack of dessert quality. It is now thought by experienced pomologists that Scott's Winter may fill the great want in the colder parts of Canada for a long-keeping apple of good dessert quality to grow for shipment to the English market.



SCOTT'S WINTER APPLE.

Scott's Winter is a fruit medium to large in size, tending, by its habit of overbearing, to run under the dimensions of the cut, which is also rather too conical. On a yellow ground it is heavily splashed and often nearly covered with a dark red. The red color extends more or less to the core. In form it is roundish-conical somewhat ribbed, (but rather less, usually, than in the cut). The core is small, seeds small and dark brown, stem short, in a medium basin; cavity also medium, calyx open. The peculiar merit of this variety is that it is a long-keeping "iron-clad," and when to that are added its free bearing quality, its beauty, and its usefulness as a culinary apple developing dessert quality late in the season, I think it will take a high position among apples for the "Cold Belt." T. H. HOSKINS, M. D.

Orleans Co., Vt.

FRUIT IN NEBRASKA.

THIS State has acquired a "great and glorious name" all over Christendom for its splendid display of fruit, in one or two cases beating the whole United States at fruit conventions, and easily carrying off first premiums. You will hardly believe me when I tell you that this reputation is a miserable myth. It is true that apples, etc., exhibited at fairs, were grown in Nebraska, and were truly and honestly offered, and as truly won the premiums; but it is just as true that the State of Nebraska, as a State, had no more to do with it than the man in the moon. Down in the extreme southeast corner of this State, bordering on Iowa, Missouri and Kansas, are three or four counties where fruit is grown, but to so small an extent that I have never seen, in eleven years' residence, a single specimen, although I have been within sixty miles of the fruit region, and if the Missouri River in its vagaries had crooked around a little more to the northwest, this State would never have been heard from in fruit conventions for probably a hundred years to come, as a fruit-growing State. There happen to be in that quarter a few—a very few—nurserymen who know how, in that climate and soil, to grow fruit, and to them, and not to the State, is due all the honor.

ALL the fruit used here and throughout the whole State (nearly) comes from Chicago. We have plenty of it, but we don't grow it. When the extreme eastern end of the State is 30 or 40 years older, and the soil is thoroughly subdued from its wild condition, we may have a tithe of our demand met at home. It is humiliating to be obliged to say that the grand State of Nebraska has gained its honor in this line by a subterfuge—but so it is.

Dodge Co., Neb. S. RUFUS MASON.

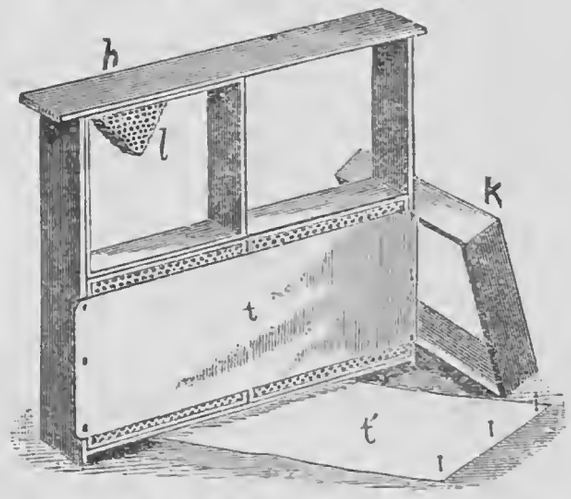
C. W. GARFIELD, Secretary of Michigan State Pomological Society, has forwarded us a circular in which he announces that the tenth annual summer meeting of the society will be held at Muskegon, Mich., June 17th 18th and 19th. Sixteen topics of vital interest to fruit-growers are to be discussed.

The Apiarian.

SURPLUS HONEY SECTIONS.

WHETHER one should mainly produce comb honey or extracted honey must depend upon the market. Comb honey commands the highest price, but considering that the bees gather more if they are relieved of the trouble of capping it, extracted honey may be just as remunerative, especially for a home market. If, however, one intends to patronize a distant market, comb honey is undoubtedly most profitable; it is more attractive and offers no opportunity for adulteration by middle-men.

There are several ways of storing comb honey, which meet with more or less approval by different apiarists. One method is to collect it in sections, or small square frames, each of which will hold about a pound and a half. These sections are placed in the second story, which is but seldom entered by the queen for the purpose of laying, if she has sufficient room in the brood nest. They may be put in



crates which are placed directly on top of the brood frames, put four, six or eight, according to size, in each frame as represented in the cut. The frames consist of strips, two inches wide, nailed together, and are made of such dimensions as to fit the upper story where they are suspended. The sections should fit snugly in the frames. To prevent the bees from building the combs together, two strips of tin, each about five inches wide, are nailed on one side of each frame. If one section in a frame should be capped before the others, it can easily be taken out and an empty one put in its place.

WORK AMONG BEES AND EFFECT OF STINGS.

AT a recent a recent meeting of bee-keepers at Lansing, Mich., Professor Cook said in answer to a query: "I believe the oftener colonies are looked through in summer the better. The bees will get used to it, and will go right on gathering and storing; I have seen the queen keep on laying eggs when I had the combs out. In order not to disturb their operations one must be quiet. Working with the bees will overcome nervousness. When I am feeling nervous and go out to work among the bees, I soon get entirely over it. This matter of fear can be got over by any one. Getting stung gets one used to the poison, so he will not be injured by it. A bee-sting does not swell on me now, and one of the students at the college told me that he was stung yesterday without knowing it, until he saw the swelling some time afterward; yet at first a bee-sting was painful to him. I think this is on the principle of inoculation. Mr. Langstroth said that at first his eyes would swell if he was stung on any part of his body, but he got over this. Mr. Davis does not know when bees sting him, though it sometimes swells on him. Thickness of skin may make some difference."

Now the busy season for the bee-keeper is at hand. From daylight till dark the apiary will resound with the contented hum of the industrious workers. Be vigilant and observing. You must at any time know the exact condition of every colony in order always to be able to perform the right operation at the right moment. Shade the hives from the hot sun wherever it is possible; too high a temperature may cause the bees to desert the hive.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JUNE 14, 1879.

THOSE who are interested in the present crop prospect of the United States will find much to study, in next week's RURAL NEW-YORKER.

IS IT EXTRAVAGANCE?

UNDER the above heading a Western agricultural journal which, by-the-by, carefully avoids mentioning the RURAL NEW-YORKER as the source of the article, criticises, very favorably and fairly, however, our recent remarks upon the system of purchasing on credit. The extensive and generally favorable notice which our articles have called forth from our contemporaries, is proof, if any such were wanting, that they were both timely and pertinent, and that they promise to be useful to a great degree, and in that to subserve the purpose for which they were written.

The journal alluded to professes to believe that we implied that "in order to make their business pay, farmers must deprive themselves of all the luxuries of life and confine themselves to the mere necessities of existence." Nothing could be more uncandid and gratuitous on the part of our respected contemporary. The whole conduct and expression of the RURAL NEW-YORKER forbid any such assumption. If any one particular thought is more frequently or strongly expressed, directly and indirectly, throughout our columns, than another, it is, that farmers should by all means avail themselves of every advantage for comfort, pleasure, and enjoyment in life, that their calling should secure to them. To this end this journal is thoroughly devoted, and we defy any reader, be he or she ever so prejudiced in our disfavor, to rise from a perusal of any number without feeling that the culture of the intellect and of the amenities of social life, are served as faithfully and as energetically as the most practical interests of farm and garden. The fact is, that to a strong sense of what is due to our readers in this regard, they owe the expression of our honest ideas on the subject of dealing for cash only, and the avoidance of credit.

The whole of our remarks have for their purpose the elevation of the agricultural interest to independence, comfort and ease of life. They encourage the saving of money that it may be used to elevate; and discourage the reckless spending of credit which keeps a man poor and heaps discouragements upon him. It is not that we would have him drudge; on the contrary, we would lighten his toil and fill his home with all the refinements of rural life and social culture as soon as he has secured the means therefor. To have all these things and owe for them is not any additional happiness. It is "a worm-in-the bud," which feeds upon the blossom of a man's hopes and blasts their fruitfulness. To try to induce any man, woman or child, born, reared or living on a farm, or any mechanic, artisan or workman whatever, to believe that he can enjoy the pleasures and luxuries of life, except so far as he earns them by labor, is wrong; it is false and must be disastrous to the misled victims. We desire no such sacrifices. We would rather utter a warning voice than tempt to a course that must disappoint in the end. It is not extravagance to possess all these things when they can be procured and paid for without going into debt; but it is extravagance to purchase anything but the actual necessaries of life or anything that can be dispensed with, by the use of borrowed money or on credit.

It is also a great mistake to lead the young people to suppose that work is degrading, demoralizing or "too tiresome for anything." Let them do their duty; occupy the walk in life allotted to them cheerfully, faithfully; and enjoy from the fruits of their industry every possible comfort and advantage. It is their right and we will help them to secure and maintain it. But, in the words of our great Teacher, we would admonish them that "these ought ye to have done, and not to leave the other undone." The spirit of the age is not too favorable by any means to economy, either true or false; it has, on the contrary, rather a tendency the other way, and the whole country has been suffering during a cycle of hard times which has been unexampled for severity and duration, from the effects of this tendency. It is time now to be wise. There are many sore hearts, and broken hopes, and homes bereft of prosperity which was built on a foundation of sand. Those build surely, who build slowly and upon a solid foundation; and although our homily may be flavored with a bitter herb, we would offer that as a tonic which may contribute healthfulness and strength.

BETTER FARMING NEEDED.

THE competition among farmers is much closer and sharper than formerly. The time has gone by in most sections of the country when poor farming could insure even the moderate success of making a living. During the last four or five years thousands of farmers have steadily lost money, and unless they reverse the process, it is only a question of time when they must go under. The losses of farmers have generally been attributed to the times and, with the return of prosperity and general revival of business, it has been supposed that farmers' profits would return and everybody could make money again. Undoubtedly the stress of the times has affected farmers as well as everybody else; but the time will never come when any but the best farming will be successful. The nominal success which has always heretofore attended even the poorest farming has been due to the moderate ambition of most farmers and the little with which they have been contented. So long as men are satisfied with hard work and getting little or nothing for their invested capital, and as an outcome making a bare living, it ought not to be difficult to satisfy them. Yet this is what thousands of farmers have done of late years. During the war, and for a few years after, in our era of high prices, most farmers made some money. Old debts were paid, and in some cases better modes of farming were adopted. But the years which have followed have pinched us all. The more expensive habits of living, adopted ten or twelve years ago, are not readily dropped. Prices of farm produce have fallen as low as before the war, and from almost every quarter we are advised that expenses of every kind must be cut down in a corresponding ratio, or everybody will go to ruin.

Undoubtedly this is sensible advice for a large proportion of farmers. Wherever the soil has been allowed to run down; wherever weeds have crept in, increasing the cost of cultivation; wherever, from any cause, the productive capacity of the farm has decreased, an immediate cutting down of living expenses is a necessity, dire though it may seem. But it is foolish for farmers to look at this subject from the standpoint of miserly parsimony. No class of men work harder and none are better entitled to the comforts and luxuries which hard work should obtain. While poor farming may not, and probably will not, make even a bare living, a better management should give the farmer something more. Prudent saving is always advisable, but a mania for retrenchment, such as is now prevalent, is not wise. Much that is said about saving, under the influence of this mania, is sheer nonsense. We have heard farmers talk about reducing expenses by paying less wages, when it was a solemn fact that they would steadily lose money every year if their hired help worked for nothing. What such farmers need is better management, by which the productive capacity of their farms can be increased. After this they may also find it necessary to decrease expenses as much as possible without decreasing production.

Better farming is the specific for most of the evils of which farmers complain. The competition in farming is now so sharp that we shall need better farming than we have had, to prevent absolute losses. We have no expectation, and scarcely any wish for a return of days when slip-shod farming could make money. Poor farming inevitably tends to sterility of the soil, and it will be a blessing in disguise if we have a return of times when only good farming can succeed. But the misapprehension which so widely prevails that the losses of our present farming should or can be remedied by savings, is working incalculable mischief. The present year, with our currency down to hard-pan, offers better opportunities for moderate profits as the result of well-directed efforts than we have seen in years before. The speculative prices which prevailed in war times must not be expected, but farmers who have land in good condition for cropping, will make a serious mistake if they do not invest the labor necessary to secure a crop. It will probably cost less to produce anything now than in any previous year since the war, and the prices of farm products are likely to be higher rather than lower.

ARE WE PROSPEROUS OR DEPRESSED?

IT has been so constantly reiterated, for a few years past, that we are in a depressed and unfortunately impoverished condition, that our own people have come to believe it without any due consideration of the facts. But when had we more capital in improved lands, in comfortable dwellings, in factories for the production of clothes to comfort the body, in furnaces and mills for the production of iron and steel for the manufacture of machines and implements of every conceivable variety, administering to the necessities, comforts and luxury of the people? When had we a capacity to produce more surplus of wheat and corn for bread? When grew we more animals to supply human food and administer to the pleasures of life? When had we more money capital, or any money that sought investment at four per cent? When before were the people able to loan the Government eighteen hundred millions of dollars? When, in the history of the world could cotton fabrics of all descriptions be produced at so little cost? What element of wealth do we lack? If we are in an impoverished condition, it is the poverty of superabundance—the poverty of too much food, too much clothing, too much machinery, too much of all the commodities that administer to the necessities, conveniences, comforts and luxuries of life. We are unfortunate in having too much, unfortunate in not being able to use or sell all we produce.

During the fiscal years 1876, 1877, 1878 and three months of 1879, we have exported $704,243,518 worth of our own products more than all our importations. This is an average of more than one hundred and eighty-seven millions per year, and the average for the last two years has been more than two hundred and fifty-five millions per year. Does this look like financial distress? Two hundred and fifty-five millions per annum more to sell than we want to buy! A few more such years of distress will make us the richest nation on earth. In 1873, the balance of trade was against us over one hundred and nineteen millions. That was the year of the panic. We had thought ourselves prosperous before that, yet from 1863 to 1873 inclusive, we had run in debt every year from 39 millions up to 182 millions. In 1873 we bought 59 millions' worth of iron and steel; in 1878 only nine millions. Here was a saving of 50 millions. On railroad bars we saved 19 millions. We saved 74 millions on cotton and woolen manufactures. We made enough to supply these millions and all we could sell abroad. We are now diligently hunting up other markets—can sell to any new customer we can find. Our distressing poverty has put us in possession of enormous surplus productions and manufactures. Only tell us where we can sell them and we shall be happy.

ENGLISH AGRICULTURE.

THERE is room in the world for all. The briskest competition should engender no feeling of gratification at the reverses of a rival. Therefore it is a matter for regret to notice the unsatisfactory, not to say disastrous condition of English agriculture. English journals are filled with complaints and forebodings of evil. Agriculture was never in so depressed a condition. Rents are unpaid; farms go a-begging; the owners cannot work them; and tenants cannot make enough out of them to pay for labor and for rent. The English farmers are deluged under a flood of American products. The cheap lands of this great continent and our free system of labor—in which we include the privilege to work without losing caste as a gentleman—have borne the fruit which has been so long a-ripening; and our unfortunate rivals across the water are no longer able to compete with us. The gates are now broken down. Our exports are flowing abroad nearly at the rate of one million dollars each day, over and above the amount of imports. This result is the inevitable effect of a law which no man, or nation, can set aside. We could not help it if we would. The best we can do is to offer to our rivals a position by our side where they can share our advantages. Here is room for all. There, the balance is disturbed; here it is suspended evenly and is not likely to be disturbed until our broad fields and plains are fully occupied. And this cannot occur for a century, perhaps for several of them to come.

BREVITIES.

NONE should fail to read the important address of Dr. Lawes on pages 375 and 376.

OUR respected correspondent, Mr. S. B. Peck, of Muskegon, Mich., is now 74 years of age.

FLUID extract of the leaves of Arbor-vitæ is recommended for intermittent fevers and also for rheumatism.

MR. HOVEY implies in English papers that the Horse-chestnut is a faster-growing tree than the Tulip—which is a mistake.

THE Gardeners' Chronicle says that Madame Vilmorin's improved French variety of the Dandelion is, in fact, a very excellent and agreeable salad plant when properly cultivated and blanched.

NOW is the time to use Hellebore upon currant bushes to destroy the currant worm. Use four tablespoonfuls of the powder to a pailful of water.

MR. E. S. RAND, who has been spending a year or so in Brazil, is so enraptured with the climate that he has "little wish to come home." He says it is "the loveliest and most healthy in the world."

DR. HOSKINS tells the writer that he plants twice as many trees in his orchards as he intends to remain, calculating that the intermediate trees will twice pay for themselves before they seriously interfere with the others, and have to be removed.

As stated last year, the quantity of flour or plaster with which Paris-green is mixed to kill potato beetles, may be much greater than supposed. One farmer told us that he used one pound of Paris-green to 300 pounds of plaster effectually. When so used, care must be taken to mix the two thoroughly.

MR. PETER HENDERSON, in the Gardeners' Monthly, says that his experience has never yet shown him a single instance wherein he was *certain* that plants either absorb liquid manure, or even fertilizing gases by their leaves. He states that plants growing in air so strongly impregnated with the effluvia from fertilizer factories that it is almost unbearable, are not appreciably benefited thereby. The air is a gas or rather a combination of gases, and there are plants which live upon the air and thrive. Don't their leaves absorb the gases?

OUR correspondent, Professor Sheldon, of Cirencester, England, closes a note to the Agricultural Gazette thus gloomywise: "The dread silence of despair pervades the country; people have left off grumbling—they have no heart for even that. We are on the eve of a crisis." When we of this country consider our abundant crops during several years past, and the promise of abundant crops for still another season, and think of the agricultural distress in England, we should be thankful indeed. But *thankfulness* is a rare and a puny plant. It is "smothered out" by the ubiquitous weed, *querulousness*.

"AMATEUR" asks in the N. Y. Tribune: "Are the packages of *garden seed in all the stores* kept over indefinitely from year to year until sold? I never knew a dealer to throw any away on account of age. Ought not the law to compel growers of seeds to print the year on the parcel, so that the buyer may know whether his cucumber or onion seed is a year or forty years old?" Any seedsman unprincipled enough to sell dead seeds, would be unprincipled enough to change the envelope and date from year to year. The best way that we know of is for each purchaser to note carefully how well or ill seeds vegetate, and to purchase of those who by his own experience, he believes to sell the purest, freshest seeds.

A HIGHLY novel mode of transporting live stock over long distances has been lately mentioned in several English and Australian papers. It is proposed to throw the animals to be transported, into a profound state of coma, bear them across the ocean in a state of insensibility and revive them on landing. It is said that an Australian has actually succeeded by the injection of a vegetable poison into the ears of certain animals, in producing a condition of artificial death, then keeping the apparently lifeless bodies from decomposition by confining them in a chamber at a low temperature, and finally reviving them by the injection of a special antidote. The only fear entertained by the discoverer as to the complete success of this method of transporting animals, is that there might be some slight breakage during a long voyage, owing to the hard-frozen, brittle condition of the insensible sleepers!

DESPITE the check put upon our cattle trade with England, our importation not of beef only, but also of live animals into that country, is steadily increasing. On the Mersey the facilities for slaughtering cattle after landing, are entirely inadequate to meet the demands of our increasing importations, and enlarged abattoirs are rapidly being pushed forward to completion, both on the Liverpool and Birkenhead sides of the river. Dead meat from this country has already overcome the prejudice against it in some quarters in the Old Country, and is now largely sold as home-raised beef by the London butchers. English families are rapidly becoming acquainted with this fact; the newspapers speak of it; and public opinion is arraying itself against the butchers, not on account of selling an inferior article as English beef, but because they sell at the full price of English beef an article which, though equally good, can be had in the market at a lower figure. Of course, this underhand style of dealing tends to limit temporarily the sale of our beef; but its effects are sure to result in ultimate good. In this way the last vestiges of prejudice will be speedily removed from all classes, and as shops are soon to be opened everywhere for the honest sale of American beef, thousands who have hitherto been paying for it the price of home-raised beef, will be sure to buy it at lower rates.

Literary Miscellany.

DEAD—YET SPEAKING.

[The following beautiful and seasonable verses, which we copy from the Independent, were read at the services of commemoration of the Confederate dead at Huntsville, Alabama, on the 13th inst., by Miss Lutie Meriwether, daughter of the poet, Mrs. Lide Meriwether, who it will be seen has imbued her lines with patriotic fervor worthy the era of brotherly love. —*Memphis Appeal.*

Where broad Ohio rolls her sands to sunlit shores away,
Within a silent city stands a shaft of granite gray,
Reared by a father's loving hand above two noble boys,
The sunlight of his household band—the crowning of his joys;
One wore the blue, and fought beneath the spangled banner gay;
The other bore the southern cross—he "died and wore the gray.

Inscribed on one side, is the name of him who wore the blue,
His age—the battle where he fell—bearing his banner true;
The other bears the honored name of him who wore the gray;"
With simple record how he fell—first in the bloody fray;
The third side holds no laurel crown, no pæan from the fight,
Only these sad and humble words—"But God knows which was right."

Few words and simple! at whose sound a nation's tears shall start,
Born of a mother's deathless love, a father's steadfast heart;
May Time, the great consoler, the redresser of all wrong,
A nation's resurrection see whose voice shall swell the song—
"All honor to the soldier who, with purpose pure and bright,
In gray, or blue, fell, tried and true, to what he deemed the right."

The true, the tried, the sacrificed, are with us now—at eve
They float around us in the shapes these twilight shadows weave,
Like lulling waters fall their loving voices on the ear,
Their shadow forms float upward, through this glowing atmosphere,
As day, departing, leaves behind the glory of his beams
In purple, on yon mountain sides, and gold upon the streams.

We feel, that though invisible, their true and steadfast eyes
Are looking down upon us from the quiet of the skies;
We hear their voices in each breeze that murmurs softly by,
Its music thrills among the trees, stirred by the winds low sigh,
And spirit voices blent in prayer, float up to heaven's hight!
"Keep these, our brothers, in Thy care! God guide them to the Right!"

Then scatter laurel o'er the brave, and lilies o'er the true;
Enwreathe with bloom each lowly grave—*this soldier died for you;*
And let no martyr die in vain; but from each grave ascend
An Easter flower of new-born Love—triumphant to the end!
Clothed in the perfect panoply of Charity's great might
Uphold us with Thy mighty hand! God, keep us in the right!

AN UGLY GIRL.

(Continued from page 367.)

CHAPTER XXIII.

SUMMONED HOME.

IRENE was indeed in need of consolation, as her perturbed face testified when she came in to her brother's room soon after.

"Was there ever such an unfortunate girl as I am?" she sobbed. "I never was so happy before; but it's all over, and Mrs. Hurst was to have taken me to the flower-show at Corby next week, in a new grenadine, black, with white stripes. I knew it couldn't last! I was sure of it!"

"What? The flower-show? For goodness sake do learn to express yourself more clearly!" cried Noel, whom Clemont Dunforth's observations had thrown into a state of irritability quite foreign to his nature. "At whose expense was this new dress purchased? If at mine, I plainly tell you that it is not in my power to pay for any additions to your wardrobe; if not, I forbid you to accept the gifts of comparative strangers."

"If Mrs. Hurst chooses to be good-natured enough to buy me a pretty dress, and never tell me what she had done till the dressmaker brought it home—and such a beautiful fit! I never looked so nice before!—I don't know why I should refuse," retorted Irene, sullenly; "more particularly as Hillian says that Miss Carisforde wishes every attention paid to me. She may be ugly, but she's very kind, and I've enjoyed myself here immensely; but it's all over. Mamma wants me home, and I must go."

"I thought Mrs. Estcourt agreed to your remaining till I am myself able to accompany you to town," her brother said.

"Yes; but Maggie—poor, little, loving Maggie is ill. She's a dear child, Noel, though she does kick and fight so terribly when you offend her; and she never bites any one but me. It's a fever, ma says, and the child cries for me incessantly; and there's the others to be kept away from the infection; and ma says truly, she can't do everything; not that she's ever tried since I have known anything about it. Oh, dear! there's always something disagreeable happening in this uneven world just when you don't want it to. If ma had written the day after I had that fright in the library, I should have been quite willing to go; but now—"

She finished with a doleful sigh, and Noel, who marveled that Mrs. Estcourt should have been so thoughtless as to send for her daughter and expose her to the danger of catching a contagious disease, began to reassure her.

"I will write to your mother, Irene, and point out to her what she appears to have overlooked—that you may be attacked by this complaint if you go home just now. An experienced nurse from one of the hospitals must be procured."

"No, don't write," cried the girl, jumping up, and dashing away her tears. "I must go, Noel. Though I cannot help being sorry to leave Carisforde, I mean to do so."

"Not if I oppose it."

"Yes, whether you do or do not oppose it," she answered, firmly. "Maggie's my own little sister, and I could not rest here knowing that she was left to the mercy of strangers."

"The child has her mother," said Noel.

Irene gave a contemptuous sniff.

"As if you did not know that ma never is a bit of use in illness! Don't say any more, brother mine. Maggie wants me, and *I will go to her.* You would, if you were in my place; and though I know I am silly and flighty enough in trivial things, whenever there comes a serious trouble, I always ask myself how you would act, and try to do the same."

Noel drew her to him, and kissed her affectionately.

"My dear little sister, I know you are deciding rightly, and yet I cannot bear to let you run into danger. But here is Dr. Monson. Show him Mrs. Estcourt's letter. Perhaps, in her alarm, she has exaggerated the child's symptoms. At all events, he will tell us how we ought to act."

Dr. Monson, who was wont to lay aside his professional gravity when he encountered his patient's vivacious sister, looked serious when the affair was first laid before him; but he did not strengthen Noel's opposition to Irene's departure. On the contrary, he gave her such an approving look, that she blushed and wondered she had never before discovered what fine expressive eyes her brother's *medico* possessed.

"If Miss Estcourt will read, and be guided by a few instructions I will jot down for her," Dr. Monson said, "I see no objection to her nursing the sick child. Some one must do it; and who will set about it as tenderly as her sister?"

"Then I will go with her!" exclaimed Noel. "It will not hurt me to be carried to the railway-station, and I believe that I should bear the fatigue of the journey better than you all imagine."

"Possibly you would," his doctor rejoined; "but please to bear in mind that if you did not, you would have to be nursed as well as the little girl. Miss Estcourt would be in a pretty position truly with two invalids on her hands."

Noel groaned, and acknowledged that he must relinquish this idea; but still he could not endure the thought of letting Irene return home alone, and to such a trying task. He knew too well that far from receiving any help from her mother, the silly, weak-minded woman would increase her difficulties with her own fretful maunderings. He began to hint that he feared his sister would find her task a more trying one than she could perform, when Dr. Monson, who had been looking from one to the other, and cogitating profoundly, interposed in a very peremptory fashion.

"I cannot have you harassed and upset in your present state, Lord Carisforde. My professional honor is concerned in making a perfect cure of my patient; and I shall never be able to accomplish it if your nerves are acted upon in this way. Your pulse is galloping already; so away with you; Miss Estcourt, make your preparations for your journey, and I'll drive you to the station. Then I shall be able to ensure the briefest of leave-takings; more than that, it will enable me to telegraph to a good woman of my acquaintance, who will be very glad to help you nurse your little sister."

"Oh! Dr. Monson, how good you are!" cried Irene gratefully.

"Not a bit of it," was the bluff reply. "I want to get rid of you, and Mrs. Baynes is bothering me to find her something to do; so I shall kill two birds with one stone.'"

Irene, who was hurrying from the room to apprise Mrs. Hurst and Hillian of her immediate departure, came back to look anxiously in the Doctar's face, and ask why he was so eager to hasten her away. Did he think she had done Noel any harm?

"Not half as much as you'll do me if you detain me here, when I ought to be attending to my other patients!" he retorted, so gruffly, that she did not venture to delay any longer; and Noel saw no more of her till she ran in to bid him farewell.

As Dr. Monson had accepted Mrs. Hurst's offer of some luncheon, the brother and sister were left alone.

"Yes—yes; I will write," Irene said, in answer to his injunctions; "and you must answer my letters promptly. I shall be wearying for news of you and dear Carisforde."

"Of course, Mr. Dunforth will escort you to town. Dear Irene, make no one promise before we part; that you will not be persuaded into a hasty marriage."

"There is no danger of that," she pouted. "Clement has quite forgotten what a hurry he was in to call me his."

"I am glad he sees the necessity of prudence," was the reply.

"I'm not!" Irene frankly said. "I liked him a great deal better when he did not make money of so much importance as love. I've no objection to being rich, but if one must scheme to be so, I'd rather remain poor."

What did she mean? her brother inquired; but she shook her head and answered that there was not time to tell him, only that Clement Dunforth was greatly changed since he came to Carisforde, and that it was all owing to Hillian Gray.

"Irene, you are unjust!"

"Am I? You'll tell me next that I'm not justified in calling her deceitful!" cried Irene, angrily. "But she is—she is! or why does she pretend to me that she does not like Clem, and yet talk with him, walk with him, consult him, tell him all her secrets, and monopolize him so continually, that if I were inclined to be jealous, which I am not——. But there is Dr. Monson calling me. Good-bye, dearest Noel! Get well as quickly as you can, and don't be anxious about me."

She dashed away, catching her dress in the handle of the door, and making such a long rent that she had to pin it up before she could go any further, and, when half-way down stairs, came running back for the shawl and parasol dropped by Noel's bedside when she bade him farewell.

Dr. Monson stamped about the hall, his watch in his hand, predicting that they would be too late for the train, even if he drove all the way at a break-neck pace; but when he saw the tears glistening on Irene's eyelashes as he handed her into his carriage, his displeasure melted away, and he sharply snubbed Clement Dunforth, who commented satirically on the length of young ladies' leave-takings.

"My sister has had a miserable day for her journey," Noel observed, with a glance at the lowering sky, when Hillian Gray brought him the evening papers.

"Mrs. Hurst took care that she had plenty of wraps," said Hillian, coldly.

"Thanks; and Dunforth is with her. He will not let her run any risks. By the way, he omitted to come and bid me farewell."

"Mr. Dunforth may have thought it unnecessary, as he will so soon return."

"Return here!" exclaimed Noel, making no attempt to conceal his surprise. "I was given to understand that it was solely on Irene's account that he was lingering so long."

Hillian moved slowly towards the door, and made no reply, till, provoked at her silence, he added, meaningly:

"Perhaps Dunforth has other inducements for his frequent visits to Carisforde."

Hillian's eyes suddenly flashed an angry glance at him.

"You say 'perhaps;' yet who can know better than you, who are in his confidence, why Mr. Dunforth intends returning here?"

"I"—and Noel's tone was as resentful as her own—"in the confidence of a man whom I do not hesitate to tell you I distrust! But, pardon me, Miss Gray; I had forgotten that you regard him as a friend. I did not intend to hurt your feelings by speaking in these terms of a person whom you have admitted to such intimacy that you have scarcely a look or a word to spare for anyone else."

Hillian's cheeks became scarlet, and her lips unclosed as if she were about to utter an indignant retort; but she checked herself, and, gently bowing her head, went away.

CHAPTER XXIV.

ANSWERED AT LAST.

When once more alone, Noel endeavored to take a dispassionate review of those circumstances in the conduct of Hillian Gray, which were not only perplexing and distressing him, but which went so far to confirm everything he had heard from Clement Dunforth. Sometimes he wished that he had never suffered his anxiety to ascertain how far the tale Irene's betrothed told of their former *rencontres* could be true to induce him to question her; she had been so friendly, so charmingly frank with him till then, and the ignorance, that the poet declared to be bliss, was undoubtedly pleasanter in this case than the doubts and reserve that had ensued. He had fancied two or three times lately that her dread of Clement Dunforth's revelations might have been the cause of her changed demeanor; yet, if this were correct, why was she admitting him to her friendship? If Irene's report could be trusted, her betrothed and Hillian Gray were always seeking opportunities for being together; and not even the naturally unsuspicious temper of the little bride-elect had preserved her from twinges of jealousy.

Were these two learning to love each other? Noel ground his teeth, as he thought how he might have to be a passive looker-on, while another act of man's fickleness and woman's weakness was played out before him. He would not pretend that he should regret the loss of such a lover for Irene; but that Hillian—the pure-minded, refined Hillian—should descend from the high place in which he had throned her as a good and almost perfect woman, and accept the heart of one capable of such baseness, was agony.

It was a relief, even while it provoked him, when Mrs. Hurst put an end to his solitary musings by coming in, followed by a servant carrying her work-basket.

"I only just remembered, my dear lord, that you were alone, and that it would never do to let you get low-spirited!" she exclaimed, as she settled herself comfortably beside him; "though, perhaps, camphor would be better for your nerves than my conversation. And your poor, dear sister gone! So cheerful always, that it was quite delightful to have her here; though I could have wished that she had broken herself of the habit of jumping up so suddenly, that the stitches were frequently dragged off my knitting-pins, and the balls of worsted in all corners of the room; which, however, was of no consequence when the dear child happened to see what she had done, but involved a great deal of stooping when she didn't; but always full of mirth, which Hillian is not, much to my vexation; for I do not like to see young people mope; they are so apt to get round-shouldered, which is ruinous to the figure; and wishing one's-self dead, Lord Carisforde, is, as I have often told her, quite contrary to my notions of morality;" and Mrs. Hurst shook her head severely.

Then Hillian was unhappy! Oh! that he knew the cause! He seized his tablets, and, with their assistance, asked Mrs. Hurst if she could not assign any reason for her niece's attack of low spirits.

"No new ones," she answered. "Hillian always had been peculiar; and there had been circumstances in her life that would account for any young girl being grave beyond her years; but what was the use of brooding over the past? The world is before her," Mrs. Hurst went on, making long sweeps in the air with one of her knitting-needles. "If she does not like Carisforde, she need not remain here; there are plenty of advertisements in the papers—to go abroad, you know—a pleasant, intelligent companion, and salary no object, and so on; then why should not she and some like-minded lady—elderly, of course; I shall insist on her being elderly—go to the Alps, or Russia, or Ceylon?—stop, though; do ladies go on tours to Ceylon?—and write a book—Hillian, I mean—afterwards. Don't mind me; as I say to her, I never cared for gaddings, and would sooner sit by an English fireside than visit the court of the Shah of Persia, or any other potentate. Only you must promise to come and see me sometimes, my lord. I shall feel myself sadly deserted when none of the familiar faces are round me. Somehow, your accident, sad though it was, has been—I hope you'll not be offended at a remark that might be misconstrued; but, really, it has been a time that I shall always look back upon with pleasure, though not indifferent to your lordship's sufferings; and it will be something to think about when quite alone."

"But Miss Carisforde?" he wrote; and Mrs. Hurst gave her head another grave shake.

"I don't suppose she ever will make up her mind to live here now, and I don't know who can blame her. Not able to go into society, without friends or parents, it would be frightfully melancholy for one so young to live shut up in this great mansion, wouldn't it? Perhaps, after your lordship has gone back to town—very lively there, isn't it? and what the consumption of gas must be, it quite puzzles me to think; and a great waste of coal, which might be prevented if every one kept better hours and went to bed at ten o'clock, as I do. But what was I saying? Oh! about this great melancholy house. Very likely I shall receive orders to dismiss the servants and shut it up, which I shall not altogether regret, as there's a pretty cottage to let near Torquay, where I could sit at my window and see the visitors and the beach without the trouble of dressing and going out."

"When do you expect to hear from Miss Carisforde?" was Noel's next query.

"When she has decided on her own plans, I suppose she will apprise me of them," was the reply; and then Mrs. Hurst knitted on so tranquilly that Noel almost envied her the obtuseness—or strength of mind, which was it?—that enabled her to be so calm under any circumstances.

Clement Dunforth appeared at Carisforde on the following day, having been, he laughingly declared, so summarily dismissed by Irene, that he had only just had time to exchange a few words with Mrs. Estcourt ere the door was closed against him.

However, a letter by an early post brought the tidings Noel was so anxious to receive. Little Maggie was seriously but not dangerously ill; the nurse recommended by Dr. Monson, was the nicest, kindest of creatures; and the children were so delighted to have their much-enduring elder sister back, that Irene was astonished as well as gratified by the affectionate reception they had given her.

"Mamma is much as usual," the writer added. "She complains of having had to sit up for several nights and being quite worn-out with anxiety and fatigue, but Maggie says she used to snore dreadfully, and be so cross if aroused, that I don't think it's quite true. I should have sent you a few lines by Clem, just to say that things were not as bad as we feared, but he was in such a hurry, having quite a heap of business matters to attend to, that he could scarcely stop to speak to mamma; and he so positively refused to come into the house, that I believe he was afraid of catching the fever, which, by-the-bye, isn't a fever at all."

"The fellow is an arch hypocrite!" exclaimed Noel, scornfully. "A falsehood runs so glibly off his tongue, that it is difficult to decide when he is telling the truth or *vice versa*. If he is so ready to transfer his allegiance from poor Irene, who has at least the merit of being frank and good, to a girl whom his own lips have condemned, why does he not take the step boldly, and at once? He shall not play fast and loose with this little sister of mine. If he no longer purposes to make her his wife, he shall tell me so, and be stung with my candid avowal that I am glad of it. Let him wed Hillian Gray, if he is mean enough to dream that through her he can gain such aid and patronage as it is in the power of Miss Carisforde to bestow? If Hillian is as false as he—and Heaven only knows whether there is truth in women at all—why, they will be well matched."

Noel's suspicions of Clement Dunforth's meditated treachery did not diminish with time and reflection; and when on the morrow he accidentally learned that Irene's betrothed was then walking in the grounds with Miss Gray, with sternly-knit brows, he inwardly vowed that this state of affairs should soon be altered. Mr. Dunforth should no longer scheme under false colors, nor pretend that it was his interest in Irene's brother that brought him to Carisforde. He should either come there the avowed lover of Hillian Gray, or not at all.

As if in answer to his eager desire to have an interview with Clement at once, the servant appointed to attend upon him in the temporary absence of Jephson came in to say that the gentleman who was down stairs wished to know if Lord Carisforde could see him.

"Certainly. Show him up immediately."

And Noel's heart throbbed fast, though he felt the necessity of being calm and on his guard with so wary, so shrewd an antagonist.

Judge, however, his surprise when, instead of the visitor he expected, a stout, bearded German walked into the room, and, with rather a melodramatic start, paused in the middle of the floor and stared at him blankly.

"*Ach Himmel!*" he exclaimed, "here is some

strange mistake. I ask for my good friend the Viscount, and this is not he."

"Was he not aware," Noel asked, "that the title had changed hands?"

The German raised his eyebrows.

"Dead!—you mean that he is dead! Then have I lost the ever-to-be-lamented and much-esteemed companion of many pleasant hours? And, behold! I am here by his invitation."

He produced a letter written by the late Viscount a few days before his last illness commenced, urging Herr Rudolsheim not to forget his promise to spend the autumn at Carlsforde.

"I gave him this pledge when we met at Munich some months since. I come to England to fulfil it, and, alas! he is not here to greet me."

The Herr's regrets were evidently sincere, and his genial manner was so agreeable, that Noel, though ordinarily shy of strangers, soon found himself talking without reserve to this new acquaintance.

One of Herr Rudolsheim's principal motives for coming to England was to gather materials for a work of great erudition, on which he had been engaged for several years, and he proposed to avail himself of some rare volumes in the Carlsforde library, of which the late Viscount had offered him the use. Indeed, so anxious was he to see these books, that as soon as he could with propriety introduce the subject, he mentioned this, and asked permission to visit the library.

Noel reddened. It was not pleasant to have to acknowledge that he had not even the right in this house to welcome a visitor, or grant his smallest request. But the confession had to be made, and, explaining his position as concisely as he could, he referred his new acquaintance to Mrs. Hurst.

Herr Rudolsheim was too observant not to notice and sympathize with the young peer's embarrassment, but at the same time he was too polite not to do all in his power to relieve it; the best way to do which was undoubtedly to make as little comment upon the information as possible.

"Then you send me to the housekeeper? Many thanks; but I much regret that you are prisoner here and cannot be yourself my guide. May I have the great pleasure of returning to you by-and-bye, and telling you how I have fared in my researches? I should like to interest you in the work which has been the most important object of my life."

Assured by Noel that his society would be a welcome boon, he withdrew, and was seen no more for some hours, at the expiration of which time he emerged from the library, flushed and dusty, and could be scarcely prevailed upon to stay down stairs and dine, so eager was he to return to the invalid and acquaint him with an important discovery in the shape of a manuscript volume of which he had long been in search.

"But, stupid and selfish one that I am!" he interrupted himself to exclaim: "I had forgotten that I am the bearer of a letter for you. I have it somewhere. In this pocket? No; it must be in this! Your English servants are well trained, for the one who brought me this, came to my side so noiselessly that I heard no step, saw no person. I sat at a side-table, copying a few items into my note-book, and lo! I raise my head, and this lies at my elbow—superscribed, as you see, 'For Lord Carlsforde: To be delivered to him immediately.' So swift, so silent a messenger, one who disturbs you not in your occupation, is indeed invaluable!"

And then the Herr sauntered away ostensibly to look at a picture on the wall, but really to give Noel time to examine his letter, which, as he had anticipated, was signed "Ada Carlsforde."

CHAPTER XXV.

THE HERR'S OPINION.

It was very disappointing to find that Miss Carlsforde's epistle was not only of the briefest, but most unsatisfactory in its wording.

"If you mean me well, I thank you;" it was thus her tremulously-written note began: "If you do but mock me, I will try to forgive you; but if you make these advances because my wealth attracts you, then may Heaven pardon such cruelty; for I cannot."

Noel's first emotions on reading this were such angry ones, that he crushed the paper in his hand, and longed to be able to quit the house that pertained to the girl who so unjustly suspected him.

The passionate exclamation that broke from his lips made Herr Rudolsheim turn round and come towards him.

"Something disturbs you, my friend. If I can be of service, make use of me. I am trustworthy and sympathizing. If I can counsel well, I do so; if not, I practise the virtue of silence.

"Thanks, said Noel, forcing a smile; "but I was only stung for a moment by the injustice of woman. I was foolish enough to think that in a certain affair with which I will not trouble you, the rectitude of my intentions should have preserved me from being treated as if I were a covettous, heartless rascal."

"The sex is weak and impulsive, therefore apt to form conclusions more hastily than wisely" was the Herr's sententious remark. "But, on the other hand, womankind repents of a wrong so quickly and fully, that we, who are more stubborn must pity and forgive."

Noel was amused at the manner in which this was said; but he conceded that there was some truth in it. Miss Carlsforde, secluded from the world, taking her ideas from others instead of her own observations and experience, might easily be induced to prejudice herself against him; and why should he blame her if, in her humility, her inability to believe that anyone could willingly seek the intimacy of one so repulsive, she had come to the conclusion that he either amused himself at her expense, or was yielding to the attraction of the wealth with which her father had endowed her?

When the Herr had left him, he read the poor, little note again, and saw that it had been blistered by the writer's tears. This discovery softened his heart towards the lonely girl, and he felt ashamed of the resolutions to make no further advances that not an hour earlier he had been forming.

"I will write to her once more," he determined, after considerable reflection; "but I will neither defend myself nor expostulate with her. In few words and manly tones, I will regret that she should have answered my letter in a style I was not conscious of deserving. I will then fix a date for my departure from here, thank her for her hospitality, and conclude with the usual good wishes."

This intention he carried out on the following morning, as soon as he had been assisted to the reclining chair in the dressing-room, in which, as we have before said, his days were now passed; and the mystified Jephson was directed to place the missive on the same table in the library as before, Noel divining that it must be in close proximity to the concealed door by which Miss Carlsforde contrived to enter the room unobserved.

This done, and a long letter of encouragement despatched to Irene, he prepared himself for the interview with Clement Dunforth, which he had resolved to demand. In the meantime, he enjoyed the society of the sagacious German, who came to sit with him for an hour or two before commencing the literary researches, to which he proposed to devote the rest of the day.

Early though it was, he had been exploring the park and gardens, and was quite enthusiastic in his gratitude for the reception he had met with from everyone in the house.

"The good *frau*, the house-matron, the superintendent, Madame Hurst, is a manager admirable! It is to my unspeakable regret, that my not understanding your English tongue more perfectly puts her to the trouble of so much speaking."

Noel did not care to tell the Herr that Mrs. Hurst was always loquacious; but contented himself with an assurance that no one at Carlsforde begrudged attentions bestowed on him, not only as a stranger and a foreigner, but as the friend of the late Viscount.

"They are very good to me; and the little Miss Gray is a never-to-be sufficiently admired cicerone. She has shown me all the art-treasures this house contains, and she testifies an interest in my observations upon them that is most flattering. She is a young lady altogether charming; but——"

The Herr began to ruminate, and was silent so long, that Noel—curious to hear his opinion of Hillian—gently prompted him.

"You were speaking of Miss Gray, you were saying that you think her very charming, and then you paused. What was it you were about to add?"

"Ha! you have reminded me that it is by you I may be enlightened, my dear lord. Tell me then—what is it that makes the smile leave her lips, and her eyes fill with tears, at every break of our discourse? Take her out of herself—arouse her interest on some subject, and she is animated, eager and delightful. Let her relapse into silence—let her think awhile, and there steals over her a sadness so profound, so absorbing, that it astonishes and perplexes me. I am fond of studying character. I will study this young girl's. At first glance it seems to lie before me unsullied and easily read; yet I look again, and there is something on the page which is hidden from my sight."

"But it is not anything evil!" exclaimed Noel, impetuously. "I will not believe that Hillian Gray conceals aught of what she has reason to be ashamed!"

Herr Rudolsheim eyed him attentively.

"Eh! Then are you also interested in this *fraulein?* We shall study her together. Is it not so?"

Noel shrank back, confused at the consequences of his own impetuosity.

"Miss Gray is nothing to—can be nothing to me, except that I am her debtor for much kind nursing. To attempt to penetrate her secrets solely for my own satisfaction, would be an impertinence."

The professor gave him another long, searching glance, under which he was conscious of reddening and writhing, then nodded his head sagaciously.

"So, so; I am treading on ground that is dangerous. Well, then, I draw back. I say no more respecting this study so interesting, and we talk of—what?"

The question inspired another.

"You have given me your opinions of Mrs. Hurst and her niece; have you nothing to say concerning their guest, Mr. Dunforth? I fancy you met him here last evening."

"Truly, yes; and again this morning. You look surprised; you did not hear of his arrival; and yet I tell you truly that he is here. He came to offer to conduct me to some ruined abbey a few miles hence. But I say no, no, my good young sir: I have work that I must do within this library. I may not pleasure myself till it is accomplished; and so we shake hands and converse amicably till Madame Hurst invite us to the morning meal; since then, I come to you, and he walks on the terrace with Miss Gray."

Clement Dunforth must be pretty sure of his footing in this house, to visit it before breakfast, and take upon himself the duties towards its guest, which usually devolve upon the host or hostess. It is true that Miss Carlsforde's resignation of her duties had placed everyone else in an awkward position. But this did not excuse Clement's officiousness; and Noel resented it strongly.

Annoyance kept him mute, till the Herr resumed the conversation.

"Pardon, my lord, if I am inattentive. You did ask me what I think of this gentleman. *Ach himmel!* but he interests me greatly. He is a young man surprising; one of resource, of penetration, of shrewdness, altogether extraordinary. I listen to him and say nothing, but I am filled with wonder."

"You seem very favorably impressed with my brother-in-law elect," he was told.

"Ha! he is so near and dear to you? Yes, I am impressed, but did I say favorably? I think not. With your permission, I study him also; for, truly, human nature presents itself to us in many and wonderful aspects. Your brother-in-law, you say? Eh, hum!"

And again the professor rubbed his chin, and meditated; but he did not give Noel any clue to the nature of the thoughts that absorbed him. As soon as Dr. Munson appeared, he begged to be excused; and, shutting himself up in the library, would have remained till dark without refreshment, if Hillian had not coaxed him away from his precious books, at the ringing of the second bell for dinner.

And where was Clement Dunforth loitering all this while? Still by the side of Hillian Gray? That he had not returned to Corby and his own affairs there, Noel had learned from Jephson; but he did not like to put any more questions to the old man.

Surely he would make his appearance in the invalid's room before long; and, thinking this, Lord Carlsforde waited and waited, till to his unspeakable annoyance he learned that the person whom of all others he was the most anxious to see, had quitted the house an hour earlier.

Determined not to be baffled in this way again, the vexed Noel requested Jephson to give orders that on Mr. Dunforth's next visit to the Park, he should be conducted to his apartments; an order which was carried out on the following morning, when—alert, smiling, and self-possessed—Clement made his appearance.—To be continued.

THE PAST RECALLED.

A Heretofore Unpublished Letter From Pres. Lincoln to Gen. Hooker.

In the Providence Journal of May 6, is printed a letter from Lincoln to General Hooker, written just before the latter had taken command of the Army of the Potomac. The letter was penned in January, 1863, and, while the President yet retained it in his possession, an intimate friend chanced to be in his Cabinet one night, and the President read it to him, remarking, "I shall not read this to anybody else, but I want to know how it strikes you." During the following April or May, while the Army of the Potomac lay opposite Fredericksburg, this friend accompanied the President to Gen. Hooker's Headquarters on a visit. One night Gen. Hooker, alone in his tent with this gentleman said: "The President says that he showed you this letter," and he then took out that document, which was closely written on a sheet of letter-paper. The tears stood in the General's bright blue eyes as he added: "It is such a letter as a father might have written to a son. And yet it hurt me." Then, dashing the water from his eyes, he said: "When I have been to Richmond, I shall have this letter printed." This was more than sixteen years ago, and the letter has just now seen the light of day.

EXECUTIVE MANSION,
WASHINGTON, D. C., Jan. 26, 1863.

MAJOR-GENERAL HOOKER — *General:* — I have placed you at the head of the Army of the Potomac. Of course I have done this upon what appears to me to be sufficient reason, and yet I think it best for you to know that there are some things in regard to which I am not quite satisfied with you. I believe you to be a brave and skillful soldier, which, of course, I like. I also believe you do not mix politics with your profession, in which you are right. You have confidence in yourself, which is a valuable, if not an indispensable quality. You are ambitious, which, within reasonable bounds, does good rather than harm; but I think that during Gen. Burnside's command of the army you have taken counsel of your ambition and thwarted him as much as you could, in which you did a great wrong to the country and to a most meritorious and honorable brother officer. I have heard, in such way as to believe it, of your recently saying that both the Army and the Government needed a dictator. Of course, it was not for this, but in spite of it, that I have given you the command. Only those Generals who gain success can set up dictators. What I now ask of you is military success, and I will risk the dictatorship. The Government will support you to the utmost of its ability, which is neither more nor less than it has done and will for all commanders. I much fear that the spirit which you have aided to infuse into the Army, of criticising their commander, and withholding confidence from him, will now turn upon you. I shall assist you as far as I can to put it down. Neither you nor Napoleon, if he were alive again, could get any good out of an army while such a spirit prevails in it. And now beware of rashness. Beware of rashness, but with energy and sleepless vigilance go forward and give us victories. Yours, very truly, A. LINCOLN.

"SASSING" ROYALTY.

Sir Robert Peel is having a lively bout with royalty. In the course of the debate upon the Zulu war he made a playful reference to George IV., whereupon a society journal, Vanity Fair, took him to task as follows: "Sir Rober Peel's recent speech in the House of Commons has very naturally given great offense, in consequence of his disrespectful allusion to George IV and his personal remarks upon the Queen, and several members of the royal family have declared their intention never to take any notice of Sir Robert Peel for the future." Sir Robert at once sent a letter to the editor of the society journal, which, with the exception of the opening sentence, is reprinted below:

"It is superfluous to observe that such a statement is a very impudent expression of the latest development of the ridiculous imperialism of the present day, and in the official attempt to gag members of Parliament in the free debate of questions of interest in the House of Commons by the published menace of the royal displeasure there is a clear breach of privilege, recalling the most stupid exhibitions of royal misconduct.

Royal displeasure! Imperial censure! And because a member of the House of Commons dares to express his opinion in his place in Parliament, and to quote Thackeray and history in support of that opinion? After all, it is notorious that two members of the royal family indulged in similar threats, and a great deal worse, I am sorry to say, as regards Mr. Gladstone, while the language of the commander-in-chief with respect to the late Governor is too well known to need further comment at this present moment.

You appear to be instructed to make a challenge which, notwithstanding the channel through which it comes, I accept with pleasure; and you invite me to a game which two can play at; one of the parties in the contest may prove a pungent critic of the coming K——& Co.; and by the way, I would advise you strongly, as you profess to be a depository of the imperial confidence, to be a little more discreet in the circulation of your authorized versions of royal messages, or they may get you into trouble, dear Mr. Bowles. Like many others, I have put up with a good deal of your insolence from time to time, and, as your personalities have nothing in common with the honorable and legitimate duties of journalism, you will find me now quite equal to the occasion. But, as in the present instance you act as the plenipotentiary of royalty, go and tell your master that I am not the sort of man to be smothered by imperial menaces, and unless I receive the most ample satisfaction from the royal sources which have made you their most impudent mouthpiece, I shall send a copy of your statement, together with a copy of my reply, to the Prince of Wales and to the Duke of Cambridge. And, as you have published and circulated such a declaration of the intention of the royal family, with respect to my remarks in the House of Commons, I shall also avail myself of a fitting opportunity to publish and placard in London and in the provinces, under the head of "Sir Robert Peel and the rest of the royal family," both your official notification of the royal message and my contemptuous acknowledgment. I am, sir, your obedient servant, ROBERT PEEL."

HOW CHINESE RICE PAPER IS MADE.

Everybody is familiar with those brilliant, quaint pictures of insects, birds and flowers, printed upon a thick, soft, translucent material we have always called "rice paper." This is not made of rice. It is the thin slices of the pith of a plant or tree of the Aralia family—the *Futsia papyrifera* of modern botanists. The tree grows about twenty feet high, and its pith is an extensive article of commerce in China; for it is used in the manufacture of many articles, especially toys and artificial flowers. The cylinders of pith exposed on removing the bark and woody fibre are rarely an inch and a half in diameter, and as the substance is delicate and tender, rare skill and practice are required to cut the whole stick, from circumference to center, into one continuous sheet. A long, thin, very sharp knife is used for this operation. The largest sheets that can be obtained in this way are about fifteen inches long by ten wide. As soon as the sheets are cut they are spread out, all little holes carefully mended with bits of mica, and then they are pressed under weights until dry. The refuse scraps, etc., go to make pillows; the ordinary sheets are dyed brilliantly and sold to the flower makers, while the largest sheets are destined for the foreign market, after being carefully painted by skillful native artists. There is no substance yet discovered that so well represents the delicate texture of the petals of flowers as this paper of pith, and it is exported to some extent by artificial flower manufacturers. The tree could no doubt be grown here, as our climate is much like that of China. One of the most interesting things to see in China is the daily flower fair in a certain street in Pekin. Stretching along the narrow street for more than half a mile is a grand exposition of pith, paper, and silk flowers. Foreigners stand fascinated before the stands, watching the skill of the flower-makers. Each one is provided with an assortment of pincers, some wire, a pot of glue, knives, and some with pith papers of many hues. In a short time, while his deft fingers move with bewildering rapidity, he will counterfeit the dahlia, aster, or whatever real flower lies before him for a model. His skill in cutting leaf, calyx and petals, is equaled only by his marvelous eye for delicate differences of tint. Here the peddlers get their supply for the day. It is astonishing to see how fond the people are of those beautiful counterfeits of nature. The Chinese women wear no bonets or hats, but do their hair up in elaborate fashions and wear flowers instead. In some parts of the kingdom you may know if a woman be a maid, widow, or matron, by the color of the flowers she wears in her hair. The parasol, where the women wear no hats, is of course an indispensable article for any out-door excursion, and the whole family of parasols and umbrellas in China is a marvel. They are generally made of silk or paper, and are often *chefs-d'œuvre* of art.—*Transcript.*

THE DOWN-HEARTED MAN WANTED TO SEE IT.—About ten o'clock in the morning, recently, two men met on Sixth street and began threatening and calling each other names. One finally called the other a liar, and the two were about to grapple when a woman opened the door and said:

"Gentlemen, are you about to fight?"

"We are!" they answered togother.

"Then have the kindnes to wait a moment," she continued. "My poor husband has been sick for weeks and weeks, and is now just able to sit up. He is very down-hearted this morning, and if you'll only wait till I can draw him up to the window I know he'll feel very grateful to both of you."

She disappeared in the house, and after one look into each other's faces the men smiled, shook hands and departed together.

KIND AND TRUE.—When he came he was little, and round, and fat, and "cunning," and everybody loved him for his very helplessness. As he grew in stature and in age he became mischievous

and troublesome, and it was hard to bear patiently with his mad pranks. But time sobered him; there came into his face an expression that told of mingled courage and kindness, he was tender with the little ones, and loving to all, and the other day, when an accident befell him, those whom he had most tried were most devoted in their attentions and sympathy. Humanity would be better if more men had a face as kindly and a heart as true. He is only a dog.—*Boston Transcript.*

BOOKS RECEIVED.

A Hand Book of Nursing for family and general use. Published under the direction of the Connecticut Training School for Nurses, State Hospital, New Haven Conn., 266 pp. 12 mo. cloth. J. B. Lippincott & Co., Philadelphia.

We give this book hearty welcome and would gladly see a copy of it in every house in the land. It has been truly said that a good nurse is of quite as much importance in a sick room as the physician and often renders the service of the latter unnecessary. The work before us recites briefly but comprehensively the duties of the nurse in the sick room and how they should be performed; though brief in language and simple in its form it comprises the experience of years. It is not a medical treatise; there are too many directions for home practice already in the market for the public good: but it is intended to instruct the reader how best to aid the physician by properly carrying out his directions, and giving especial attention to all the surroundings both in and of the house. We have no doubt the publication of this volume will prove the means of preventing much sickness and saving many lives.

Young Folks' History of England. By CHARLOTTE M. YONGE. Boston: Estes & Lauriat.

This is a neat volume, of about 400 pages, printed in large, clear type, and handsomely and profusely illustrated. As the title suggests, the work is written in a style adapted to the comprehension of youthful minds, and the story of England's history, from the time of the conquering of the Britons by Cæsar to the happy and peaceful reign of Victoria, is presented in a manner that can scarcely fail to interest and instruct the reader. Although a young folks' history, its concise style strongly recommends it to older readers, who may wish to refresh their knowledge of English history.

MAGAZINES FOR JUNE.

THE HERALD OF HEALTH—Contents for June: Physiological and Sanitary Marriage and Parentage, by the Editor; How Children become Deformed, by Mary J. Safford, M. D.; Alcohol in Melancholy and Nervous Exhaustion, by B. W. Richardson, M. D., F. R. S. Warning; Castles in the Air; Death Speaks; Seventeen Months on Fruit and Bread; A Sensible Thing to Do; Overworked; Intrusion of Visitors; Gloomy Weather; Opium in China; Unhealthy Intellectual Development; Death of Mrs. Sarah J. Hale; Talent not always Transmitted; George Eliot's Health: Queen Victoria and Dress Reform; Lucretia Mott; Drug taking Mania; Effects of Quinine on the Hearing; Learn to Swim; Attention after Marriage; Current Literature; Health Foods.

DRUG TAKING MANIA.—Women are rather more given to drug taking than men, though both are bad enough in this respect. Here is what one of our most eminent physicians has to say on this subject:

"Dr. Holmes has said that it would be well for the world if most medicines were thrown into the sea; that it might be bad for the fishes, but it would be better for mankind. For this unasked and impertinent suggestion he has received a good deal of orthodox censure, which I am here now to share with him, for I am of the same opinion as Dr. Holmes, and this opinion has long been a part of my Christian faith. That the major part of the world does not agree with us is plain. Indeed most people seem to think that the chief end of man is to take medicine. Babies take it in their mother's milk; children cry for it; men and women unceasingly ask for it. Shrewd men have taken advantage of this instinct, and in most civilized nations it is to-day one of the chief articles of manufacture, and of commerce. It is one of those things which is never permitted to be out of sight; but is thrust upon you in the nursery, in the streets, upon the lampposts and upon the curbstones, along the highways, from the rocks which border the rivers; the medicine chest follows you at sea, as if the sea itself, a vast gallipot of nauseants, were not enough. One might naturally suppose that the supply would at length exceed the demand! but it does not. Everywhere the people are stretching out their arms and begging for medicine, blessing him who gives and cursing him who withholds. They believe, in their simplicity, that if medicines do no good, they can at least do no harm. They imagine also, that there is a medicine which may be regarded as a specific for every human malady, and that these are known to science, and that therefore we have the means of curing all diseases; but the people imagine a vain thing. Whatever medicine is capable when properly administered, of doing good, the same medicine is equally capable, when improperly administered, of doing harm; and drugs often substitute a malady more serious than that which they were intended to cure. The Irishman said his physician stuffed him so with medicine that he was sick a long time after he got well.—*Dr. Frank Hamilton.*

CONTENTS OF THE AMERICAN NATURALIST FOR JUNE: Prof. Hartt on The Brazilian Sandstone Reefs, Richard Rathbun, Rob. A. Bird, Biography, Rev. Samuel Lockwood, On the Morphology of the Semi-circular Canals, Francis Dercum, Texas in its Geognostic and Agricultural Aspects, J. Boll. Recent Literature. General Notes on Botany, Zoology, Anthropology, Geology, Geography and Microscopy.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SUNDAY-REST FOR WOMEN.

BERTHA A. WINKLER.

WHEN one considers the additional anxieties and the extra work imposed upon housewives on this day of universal repose from labor, it would seem as though the Divine Law-giver had commanded but the masculine half of the race to "Remember the Sabbath-day to keep it holy." To wives and mothers the approach of Sunday is but the signal for increased activity to supply the special wants of the rest-taking members of the family. A crowning of the week's work in one grand display of domestic skill and industry in stiff arrays of white, glossy shirts, and fluted, ruffled dresses, a sumptuous table of pastry and dainties, and rooms scrubbed and dusted to the highest possible degree. All these labors are, no doubt, a pleasure to a thorough-going housewife, and I heartily applaud her desire to contribute to the cleanliness, comfort and beauty of her home; but when it happens, as is too often the case, that the husband finds fault with the fit and set of his shirt and rewards her labors with a wry face, or the big sons unexpectedly bring a roomful of company home to dinner and the little sons take occasion to be more fastidious and fretful over the coveted dainties of the table, thus involving the poor, harassed mother in a series of discouragements and vexations, I think it is high time she too made an effort to obtain her share of Sunday-rest. The ordinary routine of her week's work, exclusive of the demands which the big and little members of the family make upon her time and attention, is sufficiently heavy to require at least one day's rest for mental and physical renovation.

But, unfortunately, a mother's heart is deaf to bodily exhaustion. She only hears the boys clamoring for good dinners and the girls preparing for church, consequently the cry of nature for rest is hushed and the good, self-denying mother alone remains to do the choring and to prepare the extra supply of good things for Sunday dinners. Perhaps if she knew less of the wants of others and left them to minister a little more to their own comforts, they would be more apt to realize the extent of her labors and learn to evince their appreciation of them in thoughtful moderation of their desires, and in endeavors to live and labor as much for her comfort as she does for theirs.

I see women whose pale, emaciated features and weary, faltering steps plainly betray the life of drudgery to which their blind devotion, their forgetfulness of self has subjected them. Week after week I see them perform the same tasks, bear the same burden apparently cheerful but in reality worn out and wretched, and,when Sunday arrives to bring rest to all the world besides, she alone remains to toil and trudge until late in the afternoon and if then—no wee ones hindering—she attempts to read a book the weary eye lids close and sleep mercifully affords what husband and children have thoughtlessly denied. It is for these women that I plead. They are no iron-clad machines to whom the wear and tear of each day does but little damage. They are your mothers, your wives, your companions, and as such the Divine decree applies to them as well as you. With you they have patiently toiled and suffered through all the various vicissitudes of life; with you they have risen at the dawn of morning and faithfully labored through the heat and burden of each day; and with you let them enjoy the calm and rest of the evening, the peace and quiet of the Sabbath. And if woman's peculiar sphere of usefulness requires more steady activity allowing no stated periods of rest save those at night, how much more should we exercise moderation in our demands for ease and comfort procured at her expense! How much more should we strive to render her duties less onerous. There are a hundred little tasks easily performed in a passing moment of leisure which we thoughtlessly allow to accumulate until they require a day's work at her hands. There are a hundred errands we might run for her on our way to and from the house and thus lessen the drag upon her feet without inconveniencing ourselves, if we but took a moment's thought. Our services to her consist in little things and great results. A cheering word spoken, at the proper time; a ready hand to perform some little office for her when required; and thoughtful forbearance of whatever may increase her discomfort or worriment will contribute wonderfully to her relief and promote the harmony and happiness of that home which she so continually strives to render attractive to us.

Let us therefore endeavor to establish a new order of things in the domestic life, by abstaining from these sumptuous Sunday-feasts, the preparation of which must necessarily require some extra labor which, from a religious point of view, should be conscientiously, if not humanely avoided; by withholding individual desires, and requirements which are not absolutely necessary and by a thoughtful regard and observance of the mother's wishes and convenience.

BABIES.

I HAVE been thinking a good while that I would like to write something for Miss Ripley's department in the RURAL, and I reckon that I have got experience enough to tell some of the young women, things they never thought about; and if there is any one thing that I pity, it is a young mother, trying just as hard as she can, to take care of her little baby, when she does not know anything in the world about it. She worries and stews, because the little thing cries and frets, and she can't stop it. The other day, Nellie Gray came to our house to visit, and she had the cunningest little bundle in her arms; there was edging, ruffles, tucks and embroidered blankets, and such a pile of muslin and ribbons; well, if I had not heard she had a little baby, I could never have guessed what it was, except there was a continued squeaking a way down in the depths, that sounded no more like a baby crying, than it did like a mouse in the wall.

"Sakes alive! Nellie, give me the baby!"

"Oh, grandmother! I shall be so glad to; and do tell me what I shall do with it; cry, cry, from one day's end to the other. Ain't there work in taking care of babies, though? but it is a darling! Just see!" and she took off a cloak, two blankets, and a veil; and smoothed out the beautiful dress that swept clear on to the floor, as the little thing lay in my lap. The baby had on a thick crocheted sacque and all you could see of the little mite, was its bare head, puckered up face, and the tips of its little red fingers.

"Oh, how warm it is!" said the young mother, as she wiped the drops off her face: "I hope baby has not got cold; it is the first time I have carried him to ride."

"Nellie Gray, sit down, and let me tell you something, you don't know no more than a calf about taking care of a baby; no wonder the little thing cries! I wonder it is alive! Just look here! the thermometer stands at 90° in the shade, and you are about melted in your muslin dress, and here is this wee baby, bundled up with as many wraps as it would need in winter, and a thick sacque, and a pinning blanket, two flannel petticoats, a cotton one and a dress; and as sure as you are alive, socks on the little feet! What on earth are you thinking of, to pile all this stuff on a two month's old baby?"

"Why, grandmother! I supposed I must!"

"And Nellie; you have got your waists and bands so tight, that baby can hardly draw a breath. No wonder at all, that baby cries! more wonder that the baby don't die! Now, just take off all these extra fixings; one skirt and the dress, are enough, and loosen your waists, and let the little atom have one good breath and a chance to stretch itself."

Its mother did as I told her, and in a few minutes the little thing cuddled down to sleep. "Let me lay it down Nellie, I'll show you how;" and so I laid it down on its side, a little curled up like a kitten, and there it lay and slept, two long hours, its mother going every few minutes, to see if any thing ailed it. "You let it alone, Nellie! Let her have her nap out, and she will be happy when she wakes up, and you will be rested too."

Baby never cried again all day; she slept two hours at a time, and her mother was as happy as could be. She kissed me when she went away, because I had taught her to take care of her little one.

It is a regular science to bring up babies, and girls should never get married till they have learned how to take care of children. Half of the babies that die, are just killed by ignorance and half of those that live, are made sick and miserable, just because their mothers did not know how to take care of them properly. These babies are little precious creatures, and if they are rightly taken care of, are but little trouble, till they get old enough to creep about, and then the joy of seeing them active and well, pays for all the trouble they make. Some mothers are so foolish, that they will not let the little ones creep, because they soil and wear their clothes. Poor women! No wonder their children are bow-legged, and have weak backs! They have no chance to develop and strengthen their limbs and muscles. Nature knows best how to manage children, and they must have a chance to develop their powers: They do not want to be encumbered with long clothes they want room to kick and stretch; a smart healthy child, is far better, than a puny, feeble baby, trigged out, with all the finery that fashion dictates; and for mercy's sake, don't roast your babies alive in hot weather, by bundling them up so they cannot have a chance to breathe. Their blood circulates fast, and they require but little clothing, if a cool day comes, it is easy to add an extra garment. GRANDMOTHER.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

Some Pleasant Aspects of Farm Life for Women.

HAVING been a subscriber for many years, I appreciate the RURAL, and, like many other things, it improves with age. I prize the free seed distribution—it has a tendency to create a love for flowers and Nature's beauties, which otherwise might be neglected. I was quite amused in reading the article, in the last number of the RURAL, entitled "The Successful Housewife." I indorse the ideas contained in it. I grant that farmers' wives are many times hard-working, slaving, unappreciated women, but then there is a "silver lining" to the dark side of their daily routine work. They have one advantage—they can see Nature in all its beauty, as their work requires them to be early risers. They inhale the fresh, early morning air, so necessary to health, which the city lady deprives herself of by taking her morning nap amid the heat and dust of the city. Then consider that the lot of the farmer's wife is cast in pleasant places, and when her in-door labors are finished, she can find amusement and recreation out-doors by admiring Nature's beauties. The fields, forests, running streams and flowers attract her attention, and she can drink in all their beauties, and, looking from Nature up to Nature's God, say "He made them all for our happiness." True, if we have a love and interest in our work, we shall not find it a disagreeable task. Every kind of work which presents itself will seem pleasant if willing, loving hands will accomplish what might otherwise seem a dreary task. Farmers have the advantage of others in being producers, and in supplying the family needs, and yet they often disgrace Nature's bountiful supply by bad cookery. For instance, the invariable diet of pork and lard pastry seen on farmers' tables counteracts the beneficial effects of country life. If farmers' wives would cook more upon hygienic principles, they ought to be the most healthy and independent people in the land. Allow me to give a few plain recipes, which, in my opinion, are an improvement on those commonly used.

Cream Pie Crust.

Take equal quantities of Graham flour and white flour, wet with thin, sweet cream, roll thin, bake in hot oven as for common pie crust. If preferred, use white flour entirely; or make a crust like common biscuit, roll thin; or, take bread dough after it is risen, knead in butter same as for biscuit, roll thin. Pumpkin, apple, cranberry and peach make excellent pies, made in this way.

Apple Puffs.

Make a cream pie crust, roll thin as possible, cut out with common biscuit cutter, wet one of the puffs around the edge, place in the center a spoonful of apple sauce; take another, cut, with small cracker cutter, a hole in the center about one inch in diameter, place the ring which is left upon the first one, pinch the edges together and bake in quick oven.

Graham Gems.

One egg, one coffeecup sweet milk, 1½ teacup Graham flour, ½ teacup superfine flour, salt, make a batter to the consistency of griddle cakes, and bake in quick oven. MARIAN.

A Letter to the Editor.

DEAR FAITH RIPLEY:—There are many subjects women can interest themselves and others in by having an opportunity to do so; if they cannot talk them over with each other, why not write and give each other the benefit of them? We can, in that way, learn many things that will be a benefit to ourselves and to those who read them. There must be many young ladies among RURAL readers who could make themselves very useful to you and to others, if they had a little confidence in themselves. I am an old housekeeper and have had a great deal of experience in many matters, and to impart my knowledge to others is something I would be happy to do if it could be *done*. Experience is a good school, but teaching is discouraging work, *unless one* is possessed of a large stock of *patience*. Now, that you have called my attention to a very useful work, I will endeavor to help you, and my sister readers, on any subject that I fully understand.

I love to read Log Cabin Sketches; Jessie is a woman after my own heart, she reminds me of my own makeshifts. Any woman who has any ingenuity can make many pretty and useful things with but little cost. Necessity is a good thing to bring out one's genius. Some may never know they have a talent for construction until necessity compels them to bring it out. Young married people now-a-days have too much to begin housekeeping with. It would be better for them if they were in our friend Jessie Seabright's place, for the few first years of their married life. Mothers are the ones to blame in these degenerate days, for not putting their daughters at useful work instead of keeping them in full dress, and they themselves doing all of the work. I have no sympathy for them, if they in after life, are reproached for not teaching their girls something that would make good wives and useful women of them. Many a good man has been ruined by his wife's ignorance, and driven from an uncomfortable home to find his happiness elsewhere. I would like to say a great deal on this subject, but not now. CARRIE B.

A Childrens' Society.

Every Saturday afternoon I have at my house from 15 to 25 children. Our "Busy Bee Club," we call it, and I assure you that it is rightly named, for a more earnest set of workers were never known. Our object is to promote temperance and good morals. It is not a secret society, for I do not believe in secret organizations for children, but we invite all to our meetings and try to entertain them as best we can. Sometimes people say to me, "Do you not get tired of them?" Tired of them! The dear little ones who flood my house with sunshine and joy? Tired of purity and of helping to train those little minds fresh from the hand of God? Ah, no! How can I be tired when our dear Saviour said, "Suffer little children to come unto me, for of such is the kingdom of Heaven?" We have $3.38 in our treasury, and next Saturday week we are to have a strawberry festival. Our motto is, Help each other, and our object is to improve. Yours truly, H. B. N.

Bonnie Repose.

A Southern Letter.

I have a beautiful flower garden, with many choice roses, lillies, shrubs, etc., etc. I would suggest an exchange of plants and seeds; many of your readers may have more of one kind of plants than he or she wishes, and would like to exchange for others. For instance, I have many of the Longiflower Lily, and would like to get the Lily Arratum in exchange. I also have the Laladum Esculentum, Spanish Moss, many grasses, wax plants, etc. I live in Beaufort, S. C. We raise fine bananas and oranges. Our roses are trees, not shrubs. I wish you could see them. The Sofrano, Samarque, Bon Silene, Merechal Neil and Malmaism bloom all the year. I know they would astonish our Northern friends. I enjoy reading the RURAL NEW-YORKER, and will be pleased to correspond with you about other things. Respectfully, S. I. GIVENS.

MANY have written requesting designs suitable for washable materials, and also cuts of children's suits. In response to these requests, I will publish in RURAL of 28 of June the designs asked for.

To those who write concerning samples, I have to say that I can obtain samples of any kind of goods, from prints at 6½c., to silks at $8 per yard, and that the same are furnished gratis to subscribers. FAITH RIPLEY.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

HOSPITALITY IN THE HOME.

THE character of a private entertainment will have that tone about it and create just such an impression as is imparted by the person who gives it. Who has not observed this? A man may do much towards making his guests feel at ease; he may be cheerful and anxious to please; but, after all, the entertainment will savor of the atmosphere which can come alone from her who is mistress and queen in her own household.

I have in my mind's eye a public man, risen from a low position to hights of fame he never dreamed of when he married a young girl, innocent, true and loving, but with no higher ambition than to keep her husband's heart, and be right royal in her own household. She was happy in her humble sphere when her husband brought home his hard-earned money, and deposited it in her lap, with perfect confidence that it would not be wasted, but spent with far more judgment than he could have displayed, even had he the time at his disposal. In a few years he sat upon a high pinnacle. The wealthy and the gifted paid him homage, and on a certain day a friend came from abroad, a guest he delighted to honor, but who had come unexpectedly, and the husband took him home to dine with his family. It was a warm day in summer, and his wife, expecting no guests, was totally unprepared and expressed herself indignantly that she should have been so treated.

What a pity that she did not better comprehend that that guest who was surrounded with wealth and all the luxuries it brings, cared more for the friendly greeting and the manner of his reception than for all the dainties that could have been placed before him. It was kind in her to desire to entertain her husband's friend sumptuously, but sad that she could not have understood that the hearty welcome, gracefully and easily given, would have compensated in a great measure for any lack in the material wants of his nature. Instead of going to welcome him with a smile, that could have spoken volumes of her heart's interest in her husband and all whom he choose to honor, she went sullenly into the kitchen, and ordered the servants to do the best they could, and absented herself from the head of the table when the meal was prepared. The foreign guest returned to his country with a feeling that something was amiss in his friend's household, but what, he never could tell.

I am here reminded of a story in the life of John Wesley. He had been preaching to a large crowd in the open air, and after the crowd had disappeared, a lady of rank in England pressed forward and said: "Mr. Wesley, I shall be happy to have you dine with me today, although I am sorry we have nothing for dinner;" and then she returned home, where a large number of guests were assembled to meet the distinguished man. But they waited and waited until hours had passed, when he was seen slowly to wend his way over the road leading to the mansion, and on reaching the entrance was greeted by the lady, who said: "Mr. Wesley, we have been long waiting for you, what could have detained you?" "My dear Madam," was his reply, "you said you had *nothing* for dinner, so I have dined with a poor woman, who gave me a good dinner of bread and cheese, with a glass of ale." The great man seized on this opportunity of teaching her a lesson which she doubtless never forgot.

Why is it that we are all so anxious, rich and poor, to put forward that which it is true cannot be disregarded, the material comforts of life; but why seek to smother the hospitable welcome, the cordial look, and the press of the hand, which is so welcome?

I once knew a very good man in the Episcopal Church, of quite ordinary talents, who had such an affectionate way of shaking hands that everybody forgot all about his sermons, and never rested until he was made a bishop.

FANCY FREE.

HORSFORD'S BREAD PREPARATION.

I HAVE received a number of inquiries from Domestic-Economy friends respecting Horsford's Bread Prepartion, several of them expressing much satisfaction with its use. Sometime ago I received a package for trial from the Rumford Chemical Works and since have used it for biscuits, cakes, fritters etc., with the best of results. I did not mix the package with twenty-five pounds of flour as directed; for my family is small and we make and eat few biscuits and cakes, but preferred to measure the soda and acid each time that I used it, with the little tin which accompanies the preparation. E. M.

DOMESTIC RECIPES.

Clam Chowder.

Open seventy-five clams and slice thin two onions; ten tomatoes peeled and chopped; one tablespoonful of minced parsley; a teaspoonful of thyme and sage mixed together; three tablespoonfuls of butter: salt and pepper. Put a layer of clams into the kettle in which you make soup, then one of tomatoes with a little of the onion; sprinkle with all of the seasonings and bits of butter. More clams, tomatoes etc, until all are in. Pour over the liquor, there must be about three pints, cover and let simmer half an hour then let boil briskly for fifteen minutes. While the chowder has been cooking, split open ten or twelve butter crackers, soak in boiling milk until oft, butter, line a hot tureen with them, and pour in the chowder. Pass sliced lemon with it.

LONG ISLAND SOUND.

rrant Catsup.

Four pounds of *ripe* currants; two pounds of white sugar stewed together until quite thick; then add a pint of vinegar, a tablespoonful each of ground cloves and cinnamon, and a teaspoonful each of pepper and salt. Boil up and bottle.

Cherry Catsup.

One pint of pure cherry juice; half a pound of sugar; a teaspoonful each of ground cloves and cinnamon. Boil to a thick sirup and bottle. N. B. P.

Raspberry Short-Cake.

Chop up three tablespoonfuls of butter into a quart of sifted flour; add a small teaspoonful of salt, the beaten yelks of two eggs and enough "loppered" milk into which a teaspoonful of soda has been stirred to mix these ingredients into a soft paste. Roll quickly into two sheets—the crust intended for the upper should be the thicker—strew the under crust thickly with sugared berries, cover with the upper crust and bake about twenty-five minutes. Cut in squares, pile upon a flat dish, split and eat with butter and sugar.

Raspberry Rolly-Poly.

One quart of flour and two teaspoonfuls of baking powder sifted together, two tablespoonfuls of butter; a little salt and sweet milk to make a soft dough. Roll out into one piece one-fourth inch thick. Strew thickly—leaving a margin at the sides—with ripe fruit sprinkled with sugar. Sew into a pudding, cloth, leaving room for swelling, put into a kettle of boiling water and keep boiling an hour and a half. Eat cold with a hard sauce.

MARY B.

IStrawberry ⁼Cake with Meringue.

Make a good puff-paste; cut as large as a pie-tin and bake in a quick oven until as brown as desired; cover with strawberries sprinkled with powdered sugar and then with a thick covering of meringue of the whites of four eggs and three tablespoonfuls of powdered sugar. Return to the oven and bake until the meringue is slightly browned. Let cool before eating.

Sweet Pickled Strawberries.

Remove the calyxes from six quarts of ripe strawberries; put into a stone jar first a layer of fruit, then a sprinkle of cinnamon and cloves, thus alternating until all are in. Bring to a boil two coffee-cups of vinegar with two pounds and a half of sugar, skim and pour over the fruit; let stand over night and in the morning drain off the sirup, boil up and pour over the berries as before. The next morning boil all gently for twenty minutes. Put into jars and cover. MRS. R. BRAYTON.

News of the Week.

MISCELLANEOUS.

Monday, June 9, 1879.

The majority of the committee on the State debt, appointed by the Constitutional Convention of Louisiana, have presented a report recommending that only $4,000,000 be paid, and that the interest be reduced from seven to four per cent. The consolidated debt at present amounts to about $12,000,000, to which sum it was reduced by a scaling process about four years ago. The bond-holders agreed to the reduction because at the same time an amendment was added to the Constitution which secured to them the full payment of their principal and interest as then determined. Now an attempt is made to repudiate most of what was then acknowledged to be the legal debt of the State, on the pretext that the Constitutional amendment was not promulgated according to law, and that the Legislature which passed the Funding Act was an illegal one supported by the Federal military power and not elected by the people. It's everlastingly easy for a tricky customer to find an excuse for refusing to repay the money he has borrowed and spent.

The Catholic archbishops and bishops assembled in New York for the consecration of the new Cathedral have signed an address to the Catholics of the United States asking for subscriptions to enable Archbishop Purcell, of Cincinnati, to discharge his liabilities. The address carefully avoids all defense and extenuation of the archbishop's management of the funds, and expressly disavows all intention of making the proposed relief a precedent in other cases in which ecclesiastics may get into pecuniary difficulties. The prelates distinctly point out that the movement is simply one of charity towards the archbishop, and the tone of the appeal might be called excellent if it were not that it seems to impose on the "honor and charity of the creditors" some sort of obligation to meet the promoters of the subscription half way, "especially as so very large a proportion of the entire debt consists of accumulated compound interest." But then the accumulation of compound interest is an essential feature of the business of savings-banks which the archbishop undertook. All interest not drawn is in law and morals a new loan, and to use the creditor's frugality and forbearance in letting it lie as an argument for his surrendering a part of his whole debt is to put a very unfortunate construction on the prudence of the poor. The assets amount to $1,181,569, from which must be deducted $404,798 of "doubtful" and "worthless" notes. The liabilities, after a surrender by some creditors of one-half their claims, amount to $2,490,881.

Gen. James Shields of Missouri, the genial, old Irish soldier and democratic politician, died suddenly at Ottumwa, Ia., Sunday week. He did good service for his country in the Mexican war, for which he was promoted to the rank of brevet major-general, and was also a general of the Union army in the war of the rebellion. He has been a member of the Illinois Legislature, Auditor and Supreme Court judge of that State, commissioner of the Illinois land office and governor of the territory of Oregon. But his chief claim to political distinction lies in the fact that he has been sent to the United States Senate by three States—by Illinois for six years from 1849, by Minnesota, just after it became a State in 1857, for two years, and by Missouri for a few weeks in the last Congress to fill the seat made vacant by the death of Mr. Bogy. He was 69 years old, and up to within a few hours of his death, was able to attend to the interests of his lecturing business, which has latterly given him support. Mrs. Lucy Stone Blackwell wishes to register at Boston as a voter under the new law allowing women to vote for members of school committees, and insists upon being registered under her maiden name of Stone. The city solicitor has been consulted and says she cannot be assessed or registered, except under the name of her husband. Simon Cameron is running a tobacco farm near Lancaster, Pa. Judge Emerson sentenced John Miles, a polygamist, at Salt Lake City, Utah, this week to pay a fine of $100 and be confined in the Nebraska penitentiary for five years, but an appeal was taken to the Supreme Court of the territory, Miles's bond being fixed at $5,000. This case has attracted unusual attention from the fact of its being the second conviction under the laws of the United States, and that Miles married three young women at the same time with the advice and consent of John Taylor, president of the Mormon church.

Judge Baxter of the United States Circuit Court decides that Memphis is a city still, in spite of the action of the Tennessee Legislature repealing its charter, which he declares to be void. Even if the legislative repeal was all right, Judge Baxter decides that it would not wipe out the city's debt, which was its purpose in going into bankruptcy. The judge holds, not only that the receiver appointed by the governor has no authority to act, but that the federal court may even proceed to levy and collect taxes, but he takes this position that the question may come before the United States Supreme Court for final settlement. There were landed at the port of New York during the last five months 49,592 immigrants, as against 28,145 in the same time last year. The number of cattle driven from Texas during the past 10 years for shipment to western markets is estimated at over 3,500,000, worth some $25,000,000 to the stock-raisers. The biggest drive was in 1870—800,000—but this year's will not be more than 200,000. Portions of Kansas and Missouri were swept by disastrous tornadoes late last week. In the former State over 40 people were killed and twice as many injured. Irving, Frankfort and Delphos were the chief sufferers. The destruction of property is very large. Hundreds of houses have been torn to pieces and the crops in the path of the cyclone are utterly destroyed. The track of the cyclone varies from three-fourths to one mile in width at intervals, as it occasionally left the ground for a short distance and again descended. Wherever it touched ground it swept everything clean—houses, trees and crops. Where it crossed Blue river it lifted every drop of water in its course, and in passing over a well in Irving it scooped it dry. Dead horses, cattle and hogs are to be found all along the line of the storm. Huge trees, two and three feet in diamter, were twisted away, and in one instance it swept along the bed of a ravine and lifted out of its narrow walls every stick of timber and carried them away. The bed of that ravine looks as if it had been swept by fire. Every article made of iron with which it came into contact was broken and twisted out of shape, seeming to confirm the theory that these storms are electric forces and not wind. All the bodies of those killed in Missouri are covered with a thick, bluish, sulphurous mud. Their clothing was striped off, or torn to shreds, their shoes torn off, and their feet and bodies burned and blackened fearfully.

A cyclone struck the earth four miles from Lee Summit, near Independance, Mo., Friday evening, and tore a furrow from the southwest to the northeast through the country 100 yards wide and and 10 miles long, leveling everything in its track and killing and wounding several people. Much damage has also been caused in Holt and Nodaway counties, Mo., by the same cause. But, although the loss has been so great in both Kansas and Missouri, it is more than outbalanced by the good done to the growing crops throughout these states by the rain accompanying the tempest. Gov. St. John of Kansas has issued an appeal for contributions in aid of those made destitute in that state by the cyclone. Money may be sent to John A. Martin at Atchison.

A new colonization plan for assisting worthy poor to find farms in the West has been organized by a number of clergymen and laymen of different denominations in New York city, under the name of the Co-operative Colonization Society. An office will be opened where the deserving poor can apply for information and assistance. Mrs. Thompson, the well-known philanthropist, has furnished funds for the immediate use of the organization. The Senate Committee on Finance has voted to postpone consideration for further action on the Warner silver bill until the first Monday in December. New York pays for police department salaries $3,206,150 annually, and adds $60,000 for supplies and $20,000 for alterations and repairs. The force consists of a president, three commissioners, a superintendent, four inspectors, 36 captains, 27 surgeons, 140 sergeants, 147 roundsmen, 2,290 patrolmen and 78 doormen. The president of the commission gets a salary of $8,000; each of the other commissioners, $6,000; the superintendent, $5,000; each inspector, $3,500; each captain and surgeon, $2,000; each sergeant, $1,600; each roundsman and patrolman, $1,200; each doorman, $900.

Cheap transportation is culminating. Rates on both grain and meats were given last week from Chicago to New York, by all rail routes, at twelve and a half cents per hundred pounds, and bargains were made as low as ten cents a hundred. The distance is a trifle under a thousand miles. This rate then becomes a little more than one-fifth of a cent per ton per mile. Telegrams even report seven and one-half cents per hundred for the entire transmit. The wildest granger can hardly ask for lower charges than these. But if profit can be drawn from these figures, what shall be said of the tariff imposed on local freights? Fair business rates are doubtless somewhere midway. Bills will be presented to the next Georgia Legislature levying a direct tax on dogs and whiskey, ad valorem—all for the benefit of public schools. The State will produce the present year more breadstuffs than for any three years past. The farmers are all in fine spirits, and pushing their business with that systematic energy which never fails to insure success.

FOREIGN.

The route pitched upon by the international congress at Paris locates the canal across the American isthmus near the railroad from Panama. This route, which utilizes the Chagres and the Obispo rivers, is rather more than 40 miles long, and it is calculated that ships can be locked through it in a day and a half. The projects which the congress finally chose between were those for a canal across the Mexican isthmus of Tehuantepec, via the San Juan river, and Lake Nicaragua; the Panama route, and two other routes lower down on the same isthmus,—one involving a mountain tunnel of from seven to ten miles long. The estimated cost ranged from $138,265,000 to $252,200,000, the longest canal, that via Lake Nicaragua, costing the least, and that through the San Blas tunnel costing the most. The Panama line is estimated to cost $208,550,000. Lesseps, who made a magnificent success of the Suez canal, is the prime mover in this undertaking and thinks that, now the route of the canal is decided upon, the money will be forthcoming to build it. This seems very improbable without government aid, but the intention to seek such is disavowed.

Baron Lionel Rothschild, the leading representative in England of the great European family of money kings, is dead at the age of 71. He was not merely a financier, but was conspicuous in politics and was elected to the House of Commons from London for many successive years, as representing liberal ideas and freedom of commerce. He was not allowed to take his seat, however, till 1858, because he was a Jew, and he was the first man of his race to sit in the Commons. He has of late been closely connected with our syndicates in the handling of United States bonds. A great drought prevails in Barbary, and it is feared that the want of water for domestic purposes will give rise to epidemic diseases. Wheat sells for $3 a pound and barley for $2, but animals of all kinds may be bought at one-third their normal price.

The imports of colonial wool into England have doubled during the last fifteen years, and now amount to about 400,000,000 pounds. Half of this is re-exported to the Continent. The home clip of this once staple commodity of England—on which the Lord Chancellor is supposed to be seated—is now of secondary importance. When the Zulus rushed in on the small British detachment of Col. Wood, and while there was yet an open road in one direction, Col Weatherly, an English cavalry officer, clapped his son, a boy of 13 who was with him, on horseback, kissed him, and told him to fly for his life. The lad jumped from the saddle, striking the horse a lash which sent it galloping off, and said: "Father, I'll die with you." The father handed his revolver to the child just as the Zulus reached, over British bodies, the spot where they stood. Weatherly slew five Zulus before he fell, but the son was killed at once. It is said that the Prince of Wales has remitted twenty per cent, of his Cornish rents. This means some $70,000. It is said that the dissensions of the agricultural and manufacturing groups of protectionists in the German reichstag have been compromised by an agreement to raise the duty on grain to 80 pfennings and reduce the duty on iron to 80 pfennings.

The Austrian convention with Turkey relating to the occupation of Bosnia and Nova-Bazar has been published, and to the great surprise of the public the preamble declares that "the fact of the occupation in no way prejudices the sovereign rights of the Sultan." This is a most dextrous and useful stroke on the part of Count Andrassy. It relieves the Porte of the heavy burden of confessing to the Mussulmans of the empire that it has ceded territory to a Power which had not assailed it in arms, which, to a good Mussulman, would have the air of sacrilege; it shuts the mouths of the Hungarians who have been declaring that the occupation would end in annexation, and the Magyars would be swamped by the Slavs; and it gives Austria the air of scrupulous moderation in carrying out the provisions of the Treaty of Berlin. On the other hand, however, nobody—or next to nobody—believes that the sovereign rights of the Sultan have the smallest prospective value,

or that he will ever be able to exercise them. Long before the question of terminating the occupation can arise, the Porte will probably have disappeared from the list of European Powers, and its claim on Bosnia have become as unsubstantial as that which the kings of Sardinia, down to our own day, used to put forward on their coins to the sovereignty of Cyprus and Jerusalem.

There has been a terrible loss of camels in the Afghan campaign. Already the trade between India and Central Asia will be crippled simply for want of means of carriage during the next few years. Thousands of camels have perished from overwork and bad forage; and as these had been got together at high prices and with great difficulty, it is easy to understand the inconvenience that will be occasioned on the frontier. A census of Portugal was taken on Dec. 31, 1877, the previous one having been taken as far back as 1863. The total population is 4,745,121, as compared with 4,343,935 in 1863; and the total increase is 401,189. Quite a commotion has been stirred in the Sultan's breast because Aleko Pasha, alias Prince Vogorides, a genuine Mussulman, appointed both by Abdul Hamid and by the Powers to govern Eastern Roumelia, concealed the fez in his trowsers' pocket when approaching Philippopolis, and put on the Bulgarian hat at his entrance into the capital of the province.

The condition of the Ministry in England does not improve, in spite of the acquisiton of the "scientific frontier" from Yakub Khan. The Duke of Argyll made an attack on them in the House of Lords a fortnight ago, in a speech which has not been matched in power and brilliance in that body within the present generation, and Lords Beaconsfield and Salisbury had nothing to say in reply except that it was indiscreet to assail them at such a critical period, and that they were doing as well as they could. It has come out distinctly in an address of General Obrutsheff, confidential representative of the Czar in Eastern Rumelia, that the Sultan has positively promised Russia that he will not occupy the Balkans—or, in other words, that he surrenders "the impregnable frontier" for securing which at Berlin the English plenipotentiaries got their Garters. Worse than all, this is believed to point to a secret understanding between Russia and Turkey which promises ill for the British protectorate of Asia Minor, and which the progress of the war in South Africa is likely to strengthen.

Photography can give us only the images of the flowers, but in MURRAY & LANMAN'S FLORIDA WATER, chemistry has preserved their aromatic essence. It is literally the bottled breath of the most fragrant products of the richest floral region in the world.

Hop Bitters has restored to sobriety and health, perfect wrecks from intemperence.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 7th, 1879.

BEANS AND PEAS.—There are no new features in beans. Marrows have only a moderate export call, 325 bbls. for the week, and with a liberal stock, prices have an easy tone. Mediums are not abundant, and fine marks are steady at full rates. All other beans quiet, with Red Kidney off from the late extreme. Peas unchanged; green, per bu., $1.80@1.85; Southern fl. f. peas, per 2 bush. bag, $2.50; Canadian field, in bulk and bond, 75@77c. Beans, marrows, prime, $1.35@1.37½; fair to good, $1.25@1.35; mediums, prime, $1.29@1.32½; fair to good, $1.20@1.25; pea, $1.20@1.35; white kidney, $1.30@1.50; do., red, prime, $3.30@3.00; do., fair to good, $2.80@2.85; black or turtle soup, $2@2.15.
Receipts of beans for week, 3,525 bush.

BEESWAX.—Trade is confined to small lots, and 24c. quoted for Western and 24@24½c. for Southern.

BROOM CORN.—Offerings are full and demand moderate.
Brush and short broom, choice, per lb., 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—Supplies for the week very heavy, adding up 45,500 pkgs.; for the past fortnight 90,500 pkgs. have been received. These are staggering figures for the early outlet of the market, and prices have ruled decidedly in buyers' favor. It is unusual to see State and Western quoted so nearly alike, as they are at this date. Exporters have drawn liberally, paying full local quotations. English reports do not encourage the sale so desirable here during an oppressive surplus. Shipments abroad for the week, 17,000 pkgs., including many half tubs. A favorable feature is uniform good quality, and the low rates may draw out an enlarged Eastern and other outside trade. Fine State, June dairies are quite as attractive as creamery, and 3c. less to the purchasers will be apt to give that class of stock a good lead.

COMPARATIVE RECEIPTS AND EXPORTS FOR THE PAST THREE YEARS.

	Receipts, pkgs.	Exports, firkins.
June 1, '78 to June 1, '79	1,500,550	313,110
" 1, '77 " " 1, '78	1,293,100	186,208
" 1, '76 " " 1, '77	1,272,200	155,532

These figures show the largest export trade ever obtained for this item.

State pails and half tubs, choice, 14c.; good to prime, 12@13c.; fair to good, 11@12c.; Welsh tubs, choice, 13½@14c.; good to prime, 12@13c.; fair to good, 11@12c.; poor, 9@10c.; State creamery, best invoices, 16@17c.; good to prime, 15@16c., sweet cream, 14@16c.; Western, best invoices, 16@17c.; good to prime, 15@16c.; fair to good, 14½@15c.; imitation creamery, 14@14c.; Western dairy, best invoices, 12@13½c.; good to prime, 11@12c.; fair to good, 10@11c.; poor to fair, 8@9c.; Western, factory, best invoices, 11c.; good to prime, 10@10½c.; fair to good, 9@10c.; poor to fair, 7@9c.; grease butter, 3@4c.

CHEESE.—The market has been rather depressed this week. The receipts have been larger, and the effort to sell them, with the same advices from abroad restraining exporters, brings about a lower range of prices; at the close 7½c. is the general outside rate, but an occasional lot reaching 7¾c.
Sales at: New factory—7¼@7½c. for best; 6¼@6¾c. for good; 5¼@6c. for fair to good; 3¼@5c. for half skimmed, and 1@3c. for skimmed; dairy at 6@6¾c. for good and fine; 5@6c. for fair to good, and 1@3c. for skimmed; Western factory at 6½@7c. for fine; 4@5c. for half skimmed, and 1@3c. for skimmed.
Liverpool cable quotation, 42s.
Steam, 35s.
Comparative receipts for the past three years:

	Rects., bxs.	Exp'ts, lbs.
June 1, 1878, to June 1, 1879	3,130,900	142,243,750
June 1, 1877, to June 1, 1878	2,675,050	117,452,460
June 1, 1876, to June 1, 1877	2,118,850	91,445,320

CORN MEAL.—Sales are at $2.50 for Brandywine and $2.15@2.35 for Western yellow.

COTTON.—There has been a very irregular market and a fair degree of activity, closing at for June, 13.09@13.10c.; July, 13,23c.; August, 13.39@13.40c.; September, 13.13@13.14c.; October, 12.12c.; November, 11.56@11.58c.; December, 11.42@11.43c.; January, 11.44@11.45c.
Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

	Uplands.	N. Orleans.	Texas.
Ordinary	11⅝	11¾	11¾
Strict ordinary	12	12⅛	12⅛
Good ordinary	12⅜	12⅝	12⅝
Strict good do	12⅝	12⅞	12¾
Low middling	12¾	12⅞	12⅞
Strict low middling	12 15-16	13 1-16	13 1-16
Middling	13 1-16	13 3-16	13 3-16
Good middling	13¾	13¼	13¼
Strict good middling	13⅝	13⅜	13⅜
Middling Fair	14 5-16	14 7-16	14 7-16
Fair	15 5-16	15 7-16	15 7-16

STAINED.

Good ordinary	11 13-16
Strict good ordinary	12 3-16
Low Middling	12¼
Middling	12⅜

DRIED FRUITS.—The market continues slow and is in a good degree nominal, the only exception being for evaporated apples, which have a very fair home trade demand.
Apples—evaporated Alden's & William's 10¼@10¾c.; do. new process at 8½@9c. State plums, 12@12½c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., ¾@10c.; unpeeled halves, 3@3¼c. quarters, 2¾@3c. Pitted cherries, 20c. Apples—New, 3¼@3¾c. for Southern quarters in bags; 3½@4c. for primo sliced; do., fair and good, 3@3½c.; State at 3½@3¾c. for new sliced; and 3@3¼c. for quarters; Western at 3@3½c. for new quarters. Raspberries, 30c.

EGGS.—Receipts for week, 11,378 bbls.; do., last week, 9,980 do. Supplies are large enough to keep down strong summer prices. There was some firmness early in the week, but at the close there are few sellers at quotations. No regular "loss off" sales are mentioned; it has been customary for the past week or so for sellers to divide losses with the buyers or agree to an average.
Near points, 14c.@14½c.; State and Penn., 13½c.; Western and Canadian prime, 13c.; poor marks, 12@12½c. Southern not wanted.

FLOUR.—There is more doing from shippers, and with the advancing wheat market, prices are rather stronger.
Latest prices are: $3.35@3.80 for inferior to very choice superfine State; $3.65@3.90 for poor to good extra do., odd lots and lines; $3.90@4.25 for good to very choice do.; $3.35@3.85 for inferior to fancy superfine Indiana, Iowa, Michigan, &c.; $3.80@3.90 for inferior to good shipping extra do., and $3.90@4.25 for good to choice extra do.; common to about choice white wheat extras, $4.35@5.40; choice to very fancy do. at $5.40@6.75; red and amber winter wheat, inferior to very choice trade and family, at $4.25@6.00; round hoop Ohio at $3.85@4.25, and trade and family brands of do. at $4.40@6.25, the latter rate for strictly fancy; St. Louis, $4.30@5.50 for inferior to good extra; $5.50@6.35 for good to very choice (with very fancy brands up to $6.75); Minnesota clear, very inferior to very choice, at $3.65@4.85; Minnesota "straight," very inferior to strictly choice, $4.35@5.75 (a few fancy as high as $6@6.25), and patent poor to strictly fancy at $5.30@6.75, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $4.75@5.10 for West Indies (the latter rate for fancy in new packages); do. for England and $3.65@3.90; do. trade and family extras, $5.25@6.25; do. for South America, $5 for standard brands (winter wheat product); No. 2 at $2.30@3.25 for very poor to strictly fancy.

FRESH FRUITS.—Russet apples nominally, $1.50@2.75, poor to prime. State; a few extra held at $3. Strawberries have ripened suddenly, and are coming from all shipping points. The weather latterly has favored the enlarged supply, but prices have to be kept popular. L. I., S. I. and up-river, 12@14c. ¾ qt.; N. J., best, 10@13c.; other, 3@7c.; N. J. hulled, 12@16c., Del. and Md., good to choice, 8@11c.; common, 5@6c. Cherries, Md., 5@10c.; few good enough for table purposes. Norf. gooseberries, $1.50@2, ₩ bush. Sales slow. Peaches are of better grade, but many have to be repacked; ½ bush. crates, $1.50@2; a few Early Beatrice, $2.50. Hot-house grapes quoted, 75c.@$1 ₩ lb. for B. Hamburg and Muscat, and 40@50c. for sweet water. Peanuts have improved in demand and price. Va. hand-picked, $1.37½@1.40; other, $1.10@1.25; Pecans, 6@8c.

GRAIN.—Wheat has advanced chiefly on speculative manipulation, and closed strong and fairly active.
Latest sales are of No. 2 spring at $1.05@1.07; No. 3 spring at 90½@92c.; rejected spring at 71½@72½c.; ungraded spring at 85c.@$1.05; mixed winter at $1.15½@$1.16; ungraded amber at $1.14½@$1.16; No. 2 amber at $1.16; ungraded red at $1.12@$1.17; No. 1 red at $1.17½@$1.19; No. 2 red at $1.17@$1.18; No. 3 red at $1.12½@$1.13; ungraded white at $1.13@$1.16; extra white at $1.17. No. 1 white at $1.16¼@$1.16½. No. 2 white at $1.14@$1.15½. New York No. 2 spring, June, at $1.06; do., July, at $1.05@$1.05¼. No. 2 red, June, at $1.17½; do., July, at $1.16@$1.17; do., August, at $1.13. No. 1 white, June, at $1.16¼; do., July, at $1.16@$1.16½. Rye at 60c.@62c for Western, and 61c.@61c. for State. Corn is lower on large receipts; sales of New York No. 2 at 44@44½c.; New York steamer mixed at 42½c.@43½c.; New York No. 3 at 40¾c.@41c.; ungraded Western mixed at 41c.@44c.; New York No. 2 white at 51½c.; lower mixed at 48c.; New York steamer yellow at 44c.@44¼c.; yellow Western at 45c.; white Western at 50c.; New York No. 2, June, at 44c.@44½c.; do., July, at 44¼c.; do., August, 46½c.@46¾c.; New York steamer mixed, June, at 45¼c.; do., July, at 45c. Oats are higher on an active trade; sales of New York No. 1 at 39c.; New York No. 2 at 38c.; do., July, option, at 37c. New York, No. 3 at 37c.; New York No. 1 white at 43c.; New York No. 2 white at 39¾c.@40c. New York No. 3 white at 38¾c.@38¾c.; white Western at 38c.@43c.; mixed do; at 36¾c.@38½c.; white State at 41c.@43c.; No. 2 Chicago in store at 37c.; do. afloat quoted at 39c.

HAY AND STRAW.—The market shows full assortments and prices easy.
Sales at 45@50c. for shipping, and 75@85c. for retail qualities. Straw at 45@50c. for long rye; 40c. for short rye, and oat at 30@40c.

HOPS.—Shipments for the week, 458 bales. Emmet Wells says in his weekly circular: "Our market continues in about the same condition as reported for the last few weeks, the change, if any, being in a little better demand without any improvement in prices. Most of our merchants are well stocked with hops, and will find no difficulty in meeting the demands of their customers during the summer months. There is still some talk of slow growth of vine in the interior caused by the late drouth, but the copious rains of Monday night and Tuesday, if extended to the hop districts, must dispel all fears which previously existed of serious damage to the vine from lack of rain, and within the next few days we expect to hear more encouraging accounts."
Quotations are for New York's new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 5@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast, nominal, 8@10.

LEATHER.—Hemlock sole at 18@20c. for light; 18½@21½c. for middle; 19@22c. for heavy and 17@19½c. for good damaged.

MAPLE SUGAR.—Supply nearly out. Remnant quoted low, 7@9c. for cakes and 75c. for syrup in tin.

OIL-CAKE.—Western is quoted at $23.50.

POULTRY AND GAME.—City dressed fowls have been plenty and low, which weakens Philadelphia and country dressed. A lot of Western a little out of condition sold at 8c. Jersey and near-by spring chickens have been plenty and lower because of the competition of the city dressed. Some lots of State and Western sold at quotation. Small turkeys are scarce and have sold up to 20c. when very choice. Large turkeys not wanted; cannot be sold above 12c.
Turkeys, prime, small, 18@20c.; fair to good large, 10@12c.; chickens, spring, Phila. dry-picked, 30@33c.; State and Western, 25@27c.; fowls, Jersey, choice, per lb., 11@12c.; State and Western, dry-picked, 10@11c.; do. do., scalded, 8@10c.; Phila. dry-picked, 11½@12½c.
Early in the week a very heavy supply made low prices for fowls; at the close there is some recovery. Chickens are easy, should be large enough to be quoted by the pound. Turkeys not wanted, especially the old toms now arriving. Southern cooped stock loses heavily on the route.
Chickens, spring, large, per lb., 27@28c.; small, 23@25c.; fowls, N. J., 10@11c.; Western, 9@10c.; Southern, 8½@9c.; roosters, old, 4@5c.; turkeys, Western, 9@11c.; ducks, N. J., N. Y. and Pa., ₩ pair, 60@75c.; Western and Southern, 40@50c. Geese, Jersey, $1.25@1.50; N. Y. and Pa., $1.25@1.50; Western, 87c.@$1; Southern, 75c.@87c.; pigeons, 40c.
Ice-house snipe and plover and choice baited pigeons supply a moderate fancy trade. Frogs' hind quarters are becoming quite a commercial item, quoted at 15@20c. per lb. Frogs should not be shipped alive, and before dressing them the shipper should learn if his consignee wants to handle that sort of "game."
Eng. Snipe, doz., $2@2.25; plover, $1.75@2; Dowitch, $1.50; small bay and sand, 40@50c.; pigeons, baited, $1.75@2; flight, $1.50@1.62; tame squabs, $2.

PROVISIONS.—Hog products have been more active and closed firm. Mess pork quoted for June, $9.85 bid and $10 asked; July at $9.85 bid and and $10 asked, and August at $9.95 bid at $10.05 asked; September at $9.95 bid and 10.00 asked. Bacon at $4.90 for long clear and $5.05 for short clear. Lard—Western steam, at $5.30 for spot lots, $6.27½@6.30 for June; $6.37½ for July, and $6.42½ for August. Stearine at 6½c. for city and Western. Tallow at 6c. for prime. Beef hams at $17.50@17.75. Beef—Extra India mess, $17.50@20, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEED-GRASS—Are dull; Clover quoted at 6½c. for prime, and 6¾@7c. for choice Western; timothy at $1.45@1.50.

TOBACCO—Has shown very little activity this week, but has been steadily held in price.

VEGETABLES.—Old potatoes have only a light, special call, few good enough to command the extreme. Poor stock is considered dear at any price at this season, and consumers of moderate means reject them. The first week of June is a very late period to report old potatoes in stock. New South are tending lower, as Norfolk will soon be added to the list. Old potatoes, best, $2.50@3; fair, $1.50@2; very poor, $1.00. Cucumbers, Sav. and Cha., ₩ crate, $2@2.50; Fla., 75c.@1.25; beans, Nor., ₩ ½ bbl. box, $2.50; N. C. flat, $2; Sav. and Ch'n, round, ₩ crate, $1@1.25; flat, 75c.@$1; green peas, L. I., ₩ bag, 87c.@$1.12; N. J., ₩ bbl., $1.25@1.75; Md., $1@1.50; asparagus, Oyster Bay, ₩ doz., $1.25@1.50; Shrewsbury, $1@1.25; tomatoes, Fla., choice, ₩ bu. crate, $1.75@2.25; prime to fair, $1@1.50; Bermuda, ₩ box, 25@50c.; radishes, near-by, ₩ 100 bunches, 25@75c.; lettuce, ₩ bbl., 50@75c., cabbage, Nor., ₩@@$1.50; rhubarb, ₩ 100 bunches, $1@1.50; onions, Bermuda, ₩ crate, $1; squash, Fla., new, 50@75c.; beets, N. J., ₩ 100 bunches, $4; turnips, $3@4; Russia, ₩ bbl., $1.75@2; carrots, $2.50@3.

WOOL.—The arrivals have been larger, but taken up close, and market is very strong at the sharp advance that has occurred latterly. Sales of XX Peunsylvania at 35c.; mixed fleeces at 33@35c.; unwashed Indiana at 25c.; spring, California, at 18@30c.; spring, Texas, at 21@25c.; do., fall, at 15@18c.

LIVE STOCK MARKETS

NEW YORK, Saturday, June 7th.

BEEVES.—Receipts for the week, 9,702 head; do., last week, 11,458 do. Light receipts and prospective limited supply gave a strong tone to the trade this week. Now that the railroad controversies have been adjusted, there will not be the demoralizing rushes of stock to this market which have many times during the past weeks produced uncertain quotations and a vexatious condition of trade. Fair to prime native and half bred Colorado steers, both stillers and corn-fed, were taken readily at an advance of strong ½c. ₩ lb., and light Texans were more than ½c. ₩ lb. higher. A lot of ordinary "through" Texas steers, 965 lbs. average, changed hands at 7½c. ₩ lb., to dress 53 lb.; about 30 car loads of Colorado stillers at 8@8½c., to dress 56 lb., and other sales of natives were at 7¾@9¾c., to dress 55@56 lb. Yards were cleared at an early hour and the market closed firm with an upward tendency.

COWS AND CALVES.—There is no change; there have been a few sales at the range of $30@55—prices which do not encourage free shipments.

VEAL CALVES.—The opening prices of the week have not been supported; at the close 8¾c. is the top for best N. J. and State; fair to good veals, 4¼@5c. Buttermilk calves, 2¼@3½c.

SHEEP AND LAMBS.—Receipts for week, 23,758 head; do. last week, 27,368 do. Demand fair and market steady at 3¾@5c. for common to choice sheep, clipped; common to choice Southern and Western lambs, 6@7¾c.; good to extra N. J., 7¾@8¼c.

HOGS.—Receipts for week, 29,977 head; do last week, 29,931 do. The market is nominally steady at $3.60@3.85 ₩ 100 for medium to good corn hogs; city dressed State, 140 lbs. down, 5¾@6c.; 140 to 180 lbs, 5¾@5¾c.; heavy, 4¾@4¾c.; Western, 4¾@5¾c.

Reading for the Young.

THE POWER OF KINDNESS.

"THERE is one chapter in my life's history that I have always kept locked in my heart," said John Haviland, as he faced the little group in the parlor; "but to-night I feel as if it were my duty to open it for your inspection; and I do it for the love of woman—for the love of a woman who made me what I am worthy to be, the husband of a good woman."

"Why, John!" said Mrs. Haviland, softly approaching—babe still held tight to her bosom—"you frighten me."

"Let's have the story," said the rest of the group, certain that something good might be anticipated; and John commenced, at first a little timid, but gaining confidence as he proceeded.

"When I first came to New York, at the age of twelve years, to seek my fortune, I can call myself a precocious chap without danger of being accused of an unusual degree of self-appreciation. I was quick to learn everything, the bad as well as the good. My employer used profane language. I picked up the oaths that he dropped with a naturalness that surprised even myself. The boys in the office all chewed tobacco. This was a little the hardest job I ever attempted, but, after two weeks of nausea and indescribable stomach wrenchings, I came off victorious, and could get away with my paper a day with the best of 'em.

"True, every word of it," said the speaker.

"One afternoon I was sent with a note from my employer to a house in the upper part of the city. I hadn't anything to read, but I had plenty of tobacco, and with that I proposed to entertain myself during the two or three hours I must spend in the passage. For some distance I did not notice who were beside me, but by-and-by a lady said, very softly and pleasantly: 'Would you please, little boy, be more careful. I am going to a party this afternoon, and I should hate to have my dress spoiled.'

"I looked into her face. It was the sweetest face I ever saw. Pale, earnest and loving, to my boyish heart it was the countenance of an angel."

"What did you say?" interrupted Mrs. Haviland, her bright eyes filling with tears, as she saw how the memory of this beautiful woman affected her husband.

"Say! There was very little I could say. I think all I did for some time was to look."

"I managed to dispose of the tobacco, however, and wiped my mouth very carefully, all of which I felt certain she saw and mentally commented upon.

"'Have you a mother, little boy?' she next asked, in the same low tone.

"'No, ma'am,' I answered, and I felt my throat filling up, and I knew I must swallow mighty fast to keep from sobbing.

"'You have a father, then, I suppose?' she kept on.

"'No, ma'am: no father.'

"'Brothers and sisters?'

"'Neither, ma'am.'

"'Then the little boy is alone in the world?'

"'All alone, ma'am.'

"'How long has his mother been dead?' and the dear woman looked away from my face, and waited till I could speak.

"'Two years,' I answered.

"'And you loved her?' came next.

"'Dearly,' was all I could say.

"She was silent for a moment, and then she said so sweetly—oh! I shall never forget it—

"'And what do you think your dear mother would say—how do you think she would feel—to know that her little boy was guilty of such a disgusting habit as this?' pointing to my cheek, where the tell-tale quid had vainly tried to stand its ground.

"'I must leave now,' she continued; 'but here is my card, and if you come to me most any evening, I shall be glad to see you, and perhaps we shall be of some service to each other.'

"She gave me her little gloved hand, and to my dying day I shall never forget the sensation of that moment. I could not bear to part with her: without her I felt that I could do nothing—with her I could grow to a man's estate—a man in the truest sense of the word. From that moment tobacco never passed my lips.

"As soon as I could summon courage I called upon the lady. Well do I remember how my heart beat as I waited in the elegant parlor for her to come down, and how awkward I felt as I followed my guide to her private sitting-room. She got at every point of my life, and before I bade her good-by it was arranged that I should spend two evenings of each week at her house, and study on the occasion just what she thought best.

"No lover ever looked forward to meetings with the mistress of his heart any more ardently than I did to these meetings with my friend.

"I grew careful of my personal appearance, careful of my conversation, and strove in every way to be worthy of the noble friendship. Two years passed in this delightful manner—two years that made me. My friend not only attended to my studies, striving also all the while to sow the right kind of spiritual seed, but she procured me a business situation with a particular friend of hers, where I remain to this day. Nobody but God knows what I owe this woman. During the last three months of those two years I noticed that she grew constantly pale and thin; she never was betrayed into speaking of herself. Sometimes, when I would ask her if she felt worse than usual, she would reply:

"Oh, no! I am only a little tired—that is all."

One evening she kept me by her sofa much longer than was her custom, while she arranged lessons, and laid out work enough, it seemed to me, for months.

"'Why so much to-night?' I inquired, conscious that my heart ached, and vaguely suspecting the cause.

"Because, dear,' she answered, 'I do not want you to come for the next week, and I am anxious that you should have sufficient work to anticipate, as well as to keep you busy. I think I can trust you to be a good boy, John?'

"'I think you can, ma'am,' I answered, almost sobbing.

"'If I should see your mother my dear boy, before long, what shall I say to her for you?'

"Then I knew all, and my grief had no bounds. It is no use to go on. She died two days after."

A TINY ENGINEER.

THERE is a certain tiny engineer, who builds bridges across great chasms, bridges floating in space, and bridges suspended from tree to tree; preys on creatures much larger than himself, and builds houses—yes, houses with doors to them, which he closes when he retires into the privacy of his own apartment. This little engineer and architect is the spider. Of course the Cousins have often seen his bridges, but I do not think they have seen the spider that lives in a house with a door. He lives in tropical countries, and is called the Trap-door Spider. His house is usually on the side of a hill, in sandy soil. He makes a little hole in the ground, spins a web over it, with a little passage in the center, leading down into the hole, spins a round door, which he fastens by a hinge to the passage, and then, no doubt, sits in his apartment with the same feeling of satisfaction a housekeeper experiences after the annual cleaning. I feel sure the fabled spider that invited the unwary fly into his little parlor belonged to this species. If frightened, the Trap-door Spider takes refuge in his house, slamming the door after him like a human being.

Another noted member of the Aranea family is the Tarantula, which is found in America, Africa, and the south of Europe. Though there is no doubt the poisonous qualities of its bite have been exaggerated, still it is an insect to be avoided. Fancy the feelings of those men Mark Twain tells of, who upset a box of live Tarantulas in their bed-room! Some of the spiders are very brilliant in appearance. There is one variety common in southern New Jersey, of a bright, canary color, marked with black bars. This web is always of one shape, bars radiating from a common center, and the interstices filled in with delicate lace work. When dew-laden in the early morning, nothing more lovely could be imagined. I shall not speak of that South American spider which is said to be so large that it preys on humming-birds, because I have no accurate scientific knowledge of it, and I wish only to speak of that I know. I might tell you of a terrific combat between a wasp and a spider, and how the spider obtains his food, but that you can find out for yourself any day.

Bergen Co., N. J. EMILY L. TAPLIN.

MAY DAYS.

MRS. E. J. RICHMOND.

JUNE may be the queen of the circle of months, but, coming from the dampness and chill of the long, long winter into the balmy sunshine and beautiful pictures of this lovely May, one can desire nothing more delightful. It seems but yesterday we were eagerly searching over the brown, damp meadows for the first blade of grass; now great stretches of clover and waving grass cover all the meadows, and even the roadside, while blue violets and golden dandelions are peeping forth wherever we may turn. The Crocuses and Hyacinths have come and gone, but the Lily of the Valley holds her graceful, sweet-scented bells still, while the pretty Snow Drop nods approvingly. The Star of Bethlehem shines with steady lustre, while the Polyanthus and the dear old Pansies, though they have been here so long, seem to be holding daily receptions, at which great numbers of people in royal purple velvet and scarlet and gold suits appear. Tulips in gorgeous coloring flaunt proudly before great blooming wreaths of flowering Almond, while the modest Lilac, dear old-fashioned flower, fills the air with sweetness. The Apple and Pear trees wear beautiful crowns of beauty—delicate, rose-tinted flowers, pure white, and now and then a young tree sports a coronal of almost rosy red, while all breathe the sweetest perfume. The birds seem delighted at this gay reception, and sing their blithest strains. Morning concerts and daily matinees are the order of the day, while the distant hills, in their blue, smoky atmosphere, give the finishing touches to a landscape well befitting "the merry, merry month of May." Even the Tinadilla seems to have caught the spirit of the scene, and glides slowly between violet-dotted meadow banks, while she mirrors the graceful, drooping willows in her depths of blue. And the glorious sunshine encircles all, the benignant flowers fall upon all, the love of the Great Father is as a crown of blessing upon all His works and upon all his creatures, in this beautiful month of May.

LETTERS FROM BOYS AND GIRLS.

Frizzle Top Tells About Cranberries.

DEAR UNCLE MARK AND RURAL COUSINS:—I would like to belong to the Y. H. C., and would also like to give a little instruction in return for all I have had. Is there any of my friends who do not like cranberries? I believe not. Now, why not raise some for yourselves. Prepare the ground by plowing or spading, and enrich it with a compost of two parts swamp muck and one part wood ashes. Bone dust is an excellent fertilizer, say, one pound to every square rod. In April, May or June, or in October and November, set the plants four inches apart, and in rows six inches apart, in beds four feet wide. Two square rods will yield four or five bushels, if very good. The vines will soon cover the ground and require no renewing, as the plant is a perennial shrub. The cranberry is one of the best plants for garden edgings or for broad belts or borders for the principal walks. It is in eating from September to June. I saw in RURAL of May 17th, that Slayer-of-Conceit will either have to lose his name or put in an appearance. I think his successor has made a good suggestion, and that we ought to act upon it. I would like to know what has become of Madcap Mollie. Can any one tell? FRIZZLE TOP.

DEAR UNCLE MARK:—I have read how some of the Cousins earn pocket money; I will relate my experience. I have had a garden from the time I was old enough to know what a plant was. My first garden was but a few feet square, and in this were crowded varieties enough to occupy a rod. For two years past I have grown but one kind of vegetable, and have had good success and a ready market. The crop I speak of was white beans. I sow oats in early spring, letting them grow till the 1st of June; they are then plowed under and the beans planted at once. This is our mode of getting a clover sod. My plot is about one-third of an acre. The crop last fall was four bushels, and sold for seven dollars and a half. Please put my name on the Horticultural Club list. WM. J. MASON.

Dodge Co., Nebraska.

DEAR UNCLE MARK:—I would like to join your Horticultural Club, as I like flowers so well. I hope all who belong to our Club will do their best. It gives me great pleasure to have flowers. I think I will try my luck with onions and cabbages, as to flowers, I like all of them. I am a girl twelve years old. My brother found three little hares yesterday; he gave two to his wife and one to me, as I am the youngest. If this is published I will write again. LUDIE STANLEY.

THE HORTICULTURAL CLUB.

I HAVE sent a package of radish seed of a new and curious variety to each member of the Club. The peculiarity of this new variety is, that although the body of the root is red, the long, tapering root, or tail, is white. Sow it now, in light, rich soil, not too severely exposed to the sun, and *water freely*. The membership of the Club has greatly increased, but there is still room for all who may wish to join. Do not forget to give your name and address. UNCLE MARK.

HIDDEN PARTS OF A SHIP OR STEAMER.

1. Give me some starch, Ainsley?
2. 'Twas a sham mockery.
3. She was bedecked with flowers.
4. In the "Bay-state" rooms were engaged.
5. I learned to steer ages ago.
6. The air off ice is cool.
7. In the prison gang Wayland appeared.
8. You'll find it in the big alley.
9. Make your best bows; prithee, why!
10. This crew is unworthy.
11. Ah! Ben, gin ends many a life.
12. Why, man, choruses are fine!
13. Shaly! arduous are your duties.
14. To the bulk he added the whole.
15. I saw Bertha to-day.
16. Dr. Burns, cupper and leecher.
17. Mary is a cook's scullion.
18. It is a staff, railed inside.
19. I saw a log lined with ivy.
20. There's a high bluff on the Irish.
21. Black eels are poison.
22. I trig gin glasses.
23. See the bowl in Eva's room!
24. Friend Maj, I believe you.
25. Stimbul Warks is off at school.

☞Answer in two weeks. LITTLE ONE.

A FRACTIONAL PUZZLE.

One-sixth of Howard; one-tenth of Montgomery; one-fourth of Kent; one-seventh of Carroll; one-seventh of Calvert; one-eighth of Somerset; one-ninth of Queen Anne; one-eighth of Caroline; one-seventh of Harford; one-tenth of Dorchester; one-sixth of Talbot. Sabbath Reading.

PSALM V.

Metrically rendered from the Hebrew by Rev. James K. Gutheim.

1. Unto my words give ear O Lord,
   Unto my thoughts vouchsafe regard.
2. The voice of my petition deign to weigh,
   My King and God, for unto Thee I pray.
3. O Lord, at early dawn Thou'lt hear my voice,
   At early dawn my prayers in Thee rejoice,
   And I look up to Thee, my hope and choice.
4. For Thou art not a God who wickedness desires,
   Evil dwells not with Thee, nor unto Thee aspires.
5. The haughty shall not stand before Thy eye,
   Thou hatest the worker of iniquity.
6. Thou wilt destroy them who speak falsehood vile,
   The Lord abhors the man of blood and guile.
7. But I, sustained by Thy surpassing grace,
   Come to Thy house, Thy sacred dwelling place,
   And worship in Thy holy shrine,
   In fear of Thee, Thy power divine.
8. Guide me, O Lord, in Thine own righteousness,
   That my observers all my course may bless,
   Make straight for me Thy way of holiness.
9. For in their mouth there's no integrity,
   Their inner life is fell malignity;
   Their throat is but an open grave,
   A smooth and flattering tongue they have.
10. Condemn them, God!—through their devices they will fall,
    Their numerous misdeeds will cast them down withal;
    For they've rebelled against Thee, spurned Thy gracious call.
11. But all that trust in Thee will ever sing
    With joy, for Thou wilt shield them 'neath Thy wing;
    And they who love Thy holy name and word,
    Exalt in Thee, their guardian and their Lord.
12. For Thou, O Lord, with blessings wilt the just endow,
    And like a shield Thy love and favor round them throw.

AN OLD TESTAMENT GEM.

IF we were called upon to point out the most wonderful, and, as it regards Christianity, the most important chapter in the Old Testament, we should select the fifty-third chapter of Isaiah. It is no wonder that intelligent minds have been convinced of the essential truth of New Testament Christianity by reading that chapter alone. We know positively that Isaiah lived and wrote many centuries before Christ came into the world. We know that chapter was in existence in the Old Hebrew Scriptures, just as it now stands, in its sublime isolation, and, to the Jewish mind, its unfathomable depth, ages upon ages before there was any solution of it at the cross of Calvary, or any other solution whatever. Outside of the New Testament, and independently of Christ, no single personage has appeared during the twenty-five centuries since the chapter was written in whom its sublime descriptions, its august attributes, and apparent contradictions of character could possibly meet. In Jesus of Nazareth alone, and in Him only as He is Immanuel, God with us, a suffering and dying Savior, but at the same time a Divine and conquering Messiah, has that chapter ever been fulfilled. In Him all the diverse descriptions meet, all the wonderful attributes blend, all the apparent contradictions are perfectly reconciled. The God-Man Mediator fulfills and harmonizes them all.

There is a remarkable parallel and resemblance between this Messianic chapter in Isaiah, and one chapter in the New Testament which stands out with alike prominence. It is the seventeenth chapter of the Gospel according to St. John. The two chapters are alike in their unique and sublime isolation, one for the Old Testament, the other for the New. Each discourse of the person, character, mission, work, passion, and glory of Christ. Each relates to the very central and essential truth of the whole gospel system. It is impossible to find anything in all the Scriptures more fundamental as to the fact, more condensed as to the statement, and more essential as the very key, which once accepted and understood, unlocks all the rest, and explains all the rest. We should say that those two chapters are the ones in which all Divine revelations reach their culminating point, and at the the same time their profoundest depth. These two chapters contain the gospel—not two gospels, but the one saving Gospel of God.

In the first passage the evangelical prophet declares the report which he had received from the Almighty by inspiration, and which was revealed to him as a vision of the coming Messiah in his state of humiliation, incarnation, voluntary obedience to the Divine law, vicarious suffering for His people, sacrificial death, justifying righteousness, and final triumph. The whole wondrous prophecy setting forth these and other affiliated doctrines of the Cross, is contained in fifteen verses, beginning with verse 13. of chapter 52, and running through chapter 53. Here the Lord speaks of the Messiah as "My servant."

In the analogous passage, John xvii, Christ himself is presented on the very eve of His passion, contemplating all He was about to do and suffer for our redemption as predicted by Isaiah. In an exalted intercessory prayer, addressed to God the Father, He speaks of Himself as "Thy Son." In view of the Cross which awaited Him on the morrow, which was to complete the great immolation, make an end of sins, put away transgression, bring in everlasting righteousness, finish His early career, and bring both glory to God and salvation to man, He said, "Father, the hour is come. Glorify Thy Son, that Thy Son also may glorify Thee. As Thou hast given Him power over all flesh, that He should give eternal life to as many as Thou hast given Him. And this is life eternal, that they may know Thee, the only true God, and Jesus Christ whom Thou hast sent;" and so on through the twenty-six verses of the chapter.—*The Interior.*

PERSONAL ITEMS.

Grand Rapids has had its bogus foreign Count. He was handsome, plausible and audacious. The young women were bewitched by him, and he picked out Estina Sexton, married her, took her to Chicago on a wedding tour, stole her money and deserted her.

Mrs. Starch of Surgeon Bay, Wis., desired to get rid of her husband. She put poison in his coffee, but the dose was so small that it made him only slightly ill. She tried again, and made the quantity so large that it did not seriously harm him. Then she experimented on a dog and a cat; but, by the time she had thoroughly mastered the subject, Mr. Starch's suspicion was aroused, and he detected the drug in his cup on the occasion of the third attempt on his life.

A family of four adults, in Northbridge, Mass., have drank enormously of cider since last fall, the quantity being estimated at forty to fifty barrels. They had been unable to sell it at a fair price, and so used it themselves. During the spring and latter part of winter it was very hard, and the drinkers were intoxicated much of the time. Six weeks ago the mother died in a fit, and later one of the sons died in a similar way, while the father has delirium tremens.

Edward Alexander Guy of Cincinnati, was in 1862 possessor of $40,000. He was a well educated, intelligent young man, and particularly pious. Convinced that the scriptural text: "Sell all that ye have and give alms," was a binding injunction, he began to dispose of his property and give the money to the poor. He bestowed the gifts slowly and carefully, and it was not until 1870 that the last dollar was gone. He is now a religious missionary in Cincinnati, penniless, but completely absorbed in his work.

A young man in Norridgewock, Me., dreamed that he was a minister, that his companion was a Judge, and that he opened his friend's court with prayer. The dream was a subject of only passing comment. That was thirty years ago. Lately, the Rev. Dr. Charles F. Allen, the dreamer, dropped into the Supreme Court at Augusta, where his old friend, now Judge Charles Danforth, was presiding. The Judge thought that the whole dream might as well be realized, and so invited the clergyman to open the court with prayer.

Willard Brown was deeply in love with Louisa Rarrott, a servant girl, in his father's family at Martinsville, Ind. She asked him to make for her a mold of a silver dollar, as she intended to go into business as a counterfeiter, and he consented; but her clumsy efforts to produce bogus coin that would pass proved a failure. Her next plan for acquiring wealth was to murder and rob old Mr. and Mrs. Brown, and she coolly requested Willard to aid her. Although her influence over him was very great, he declined to help her kill his parents; yet he promised never to divulge her proposal. One night he suspected that she was about to carry out her project and watched her. He saw her chloroform the old folks and let in Joe Greer, a desperado, who killed Brown with an iron bar and badly injured Mrs. Brown. The crime was attributed to tramps, until Willard, jealous of Joe Greer's intimacy with Louisa, spoke out.

MACHINES FOR

Threshing and Cleaning Grain and Sawing Wood.

Patented, Manufactured and Sold by

A. W. GRAY'S SONS,

Middletown Springs, Vt.

The machines with the improvements are the result of more than thirty years' careful study and experiment.

The proprietors are the inventors, ever have been and still are the sole manufacturers.

We have labored from the first to produce machines that will be durable, tasty, compact, portable, and that will run with the least possible friction.

We believe that we manufacture the best machine of the kind in the country.

Our machines have never failed to receive the highest award at all competitive exhibitions.

Wit and Humor.

A NEW SECRET ORDER.

THE other day, after a strapping young man had sold a load of corn and potatoes in the market, and had taken his team to a hotel barn to "feed," it became known to men around the barn that he was very desirous of joining some secret society in town. When questioned he admitted that such was the case, and the boys at once offered to initiate him into a new order called the "Cavaliers of Coveo." He was told that it was twice as secret as Freemasonry, much nicer than Odd-Fellowship, and the cost was only two dollars. In case he had the tooth-ache he could draw five dollars per week from the relief fund, and he was entitled to receive ten dollars for every headache and twenty-five for a sore throat.

The young man thought he had struck a big thing, and after eating a hearty dinner he was taken into a store room above the barn to be initiated.

The boys poured cold water down his back, put flour on his hair, swore him to kill his mother if commanded, and rushed him around for an hour, without a single complaint from his lips. When they had finished he inquired:

"Now I'm one of the Cavaliers of Coveo, am I?"

"You are," they answered.

"Nothing more to learn, is there?"

"Nothing."

"Well, then I'm going to lick the whole crowd," continued the candidate, and he went at it, and before he got through he had his two dollars initiation fee back and three more to boot, and had knocked everybody down two or three times apiece. He didn't seem greatly disturbed in mind as he drove out of the barn-yard. On the contrary his hat was slanted over, and he had a fresh five-cent cigar in his teeth, and mildly said to one of the barn boys:

"Say, boy, if you hear of any cavaliers asking for a coveo about my size, tell 'em I'll be in on the full of the moon to take the Royal Skyfugle Degrees."

A BLUNDER AND ITS REWARD.

DURING his first visit to Paris, M. Lasalle, a distinguished German, presented himself at the house of a well-known lady, to whom he had sent letters of introduction in advance. When the servant opened the door and received his card, she conducted him to the boudoir and told him to be seated, saying: "Madame will come immediately."

Presently the lady entered. She was in *dishabille* and her feet were bare, covered only with loose slippers. She bowed to him carelessly and said:

"Ah, there you are; good morning."

She threw herself on a sofa, let fall a slipper, and reached out to Lasalle her very pretty foot.

Lasalle was naturally completely astounded, but he remembered that at his home in Germany it was the custom sometimes to kiss a lady's hand, and he supposed it was the Paris mode to kiss her foot. Therefore he did not hesitate to imprint a kiss upon the fascinating foot so near him, but he could not avoid saying: "Thank you, madame, for this new method of making a lady's acquaintance. It is much better and certainly more generous than kissing the hand."

The lady jumped up, highly indignant.

"Who are you, sir, and what do you mean?"

He gave his name.

"You are not, then, a corn-doctor?"

"I am charmed to say, madame, that I am not."

"But you sent me the corn-doctor's card?"

It was true. Lasalle in going out that morning had picked up the card of a corn-doctor from his bureau and put it in his pocket. This, without glancing at, he had given to the servant, who had taken it to her mistress. There was nothing to do but to laugh over the joke.

A GENTLEMAN was threatening to beat a dog which barked intolerably. "Why," exclaimed an Irishman, "would you beat the poor dumb animal for spakin' out?"

A Matter of Interest to Travelers.

Tourists, emigrants and mariners find that Hostetter's Stomach Bitters is a medicinal safeguard against unhealthful influences, upon which they can implicitly rely, since it prevents the effects that an unhealthy climate, vitiated atmosphere, unaccustomed or unwholesome diet, bad water, or other conditions unfavorable to health, would otherwise produce. On long voyages or journeys by land in latitudes adjacent to the equator, it is especially useful as a preventive of the febrile complaints and disorders of the stomach, liver and bowels, which are apt to attack natives of the temperate zones sojourning or traveling in such regions, and is an excellent protection against the influence of extreme cold, sudden changes of temperature, exposure to damp or extreme fatigue. It not only prevents intermittent and remittent fever, and other diseases of a malarial type, but eradicates them, a fact which has been notorious for years past in North and South America, Mexico, the West Indies, Australia and other countries.

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

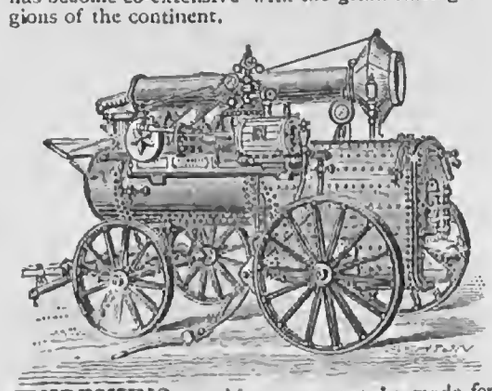
WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.

IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness,** not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence,** whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

NICHOLS, SHEPARD & CO.,
Battle Creek, Mich.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 25.
WHOLE No. 1534.

NEW YORK, JUNE 21, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

Everywhere.

WHAT WILL THE HARVEST BE?

Five Hundred Answers from Farmers and Horticulturists from all parts of the Country.

SPECIAL AND TELEGRAPHIC REPORTS UP TO THE HOUR OF GOING TO PRESS.

Wheat Below last year's Average. Last year 98—this year 90. The area Larger—yield Smaller.

Corn Backward. Fair average stand. Planted too early for a Backward Season.

TREMENDOUS ACREAGE OF POTATOES, AND GOOD YIELD.

POTATOES WILL BE CHEAP!

Oats—Acreage average, Crop will be less. Injured by cold spring. Barley poor crop. Rye about the same as last year.

Apples will be a short crop. Peaches much less than an average crop. Grapes a fair crop only. Other Small fruits abundant crops.

"FARMERS ARE IN FINE SPIRITS."

Best reports from Indiana, Nebraska and Georgia.

POOR REPORTS FROM THE EMPIRE STATE.

Kansas has a splendid Corn, but poor Wheat Crop.

Grass a short crop, except in New England, where it will be a good average.

Minnesota will have a heavy Wheat crop.

Cotton will be a fine crop. Good stand large acreage, well tilled.

On the whole, a promise of Plentiful Crops once more, and better times for Farmers.

MIDDLE STATES.

New York.

MOUNTAINVILLE, Orange Co. — Wheat is about a usual crop and on an average quantity of acres. Corn is looking well and promises to be over an average crop. Oats look badly, and are late. Barley looks well, what little there is of it in this vicinity. Potatoes have been planted in larger plots than for several years past, and have come up strong, but the bugs are numerous in the extreme, and the immense quantity of eggs on the under sides of the leaves will necessitate the use of much Paris-green. I made a discovery the other night. I have a garden patch of very early potatoes and had been very attentive in taking off every bug which could be seen at any time in the day, but had not looked at them since morning on that day, so after dark—about 9 P. M.—I took a lantern and found the bugs completely rioting on the tops, and it took two hours to clear them off. There were at least six times as many as ever appeared in the day time. Grass will be light but there is very little manure ever applied even on the meadows which are mowed every year. Clover looks better and is just in bloom. Farmers are disheartened: butter is selling from 14 to 18 cents per pound—the very best. The railroad charges 40 cents per can for taking milk to New York city, 50 miles, and brings flour from the West for 25 cents per barrel—which is an outrageous imposition, which has determined many to give up altogether sending milk. It is probable Orange county, is on the eve of a great revolution in agricultural affairs. Fruit prospects, good; money, scarce. G. G.

DUNDEE, Yates Co.—In this vicinity we are having a very severe drought; we have had no rain of any account for six or seven weeks. All crops are suffering seriously. The wheat crop is already beyond recovery. Many fields are entirely, or nearly, ruined. Farmers think there will not be more than one-fourth of a crop; some put it as high as one-third. Once in a while a piece that came through the winter in good order, will make a fair crop. Oats and barley are very backward, have germinated poorly and are only two or three inches high, and at a stand-still, and, unless rain comes soon, they must be almost entire failures. Grass is short and thin. Clover on some good soils is heading out when four or five inches high. Pastures are already showing the effects of drought. Much of the corn planted two or three weeks ago, lies as dry in the ground as on the day it was planted, and what has come up does not look vigorous. Of potatoes it is yet too early to speak. Some planted early are up nicely, and the "bugs" are waiting for their chance. They did not trouble us much here last year, but that may be all changed this season. The present prospects of fruit are good, except for plums, which seem to be dropping entirely off. Apples, pears and peaches are, at present, promising well, but we are having some days of cold, northwest wind, which may damage them to some extent. Grapes are in fine condition and promising well, but they have not blossomed yet. Sowing corn for fodder might profitably be in order when it rains, so as to give any hope that it would come up. W. H. O.

GREENWICH, Washington Co.—I have been from this to Columbus, Nebraska, and back three times during the months of March, April and May, making six journeys through the States of New York, Pennsylvania, Ohio, Indiana, Illinois, Iowa and Nebraska, and I have just returned from Montpelier, Vt., and I find the crops—grass, wheat, barley, oats, corn, potatoes, flax, etc.,—more forward and looking better in the great Platte Valley than in any other section of the country. The cultivated acreage there is far in advance of any previous year, and their prospects are flattering for an abundant harvest. The farther you come East, the more backward things are looking. I find some farmers in Vermont and in this section yet planting corn and potatoes. Vermont, to a person having been West, looks like a hard country to farm in. The crops, as a general thing, throughout the country, considering the backwardness of the season, are looking very well. In this county but little wheat is raised. Rye is the principal winter crop, and that will be nothing to boast of this season. Many of the farmers, on account of the dry weather, had begun to think the grass and oat crops would be failures; but the late rains have put a different aspect on the outlook, and we may yet get a fair crop. It is not the "bearing year" for apples and a large crop is not expected. The corn crop is not advanced enough yet to enable one to tell much about it. If the potato crop is not destroyed by the bugs and is anything like a fair yield, Washington county can make a big show towards supplying the world with the tubers. The acreage is far more than any in previous years; but the bugs are in abundance, and if not defeated, will be ruinous to the crop. This is quite a famous section for raising flax, and, in view of the backwardness of the season, it is looking well. P. K. R.

NORTON HILL, Greene Co.—This eighth of June morning we are sitting by a cheerful wood fire and find it comfortable. Frost is in the valley and the thermometer stands at 31°. We have had a very backward spring thus far. I live on the border of Greene and Albany counties, and have been about somewhat this spring and find a fair outlook hereabouts, as we do every spring in fact; for this is a country of mixed farming with no one thing as a specialty. On almost every farm there are kept cows, sheep, poultry and hogs. At the same time grain, hay and fruit are sold from almost every farm. Some stock also is raised by every farmer, for sale. I have been in some fourteen States, but have never seen a more prosperous country than this. At present grass looks as if it would be two-thirds of a crop, if we have good weather. Oats now look as if there would be about one half a crop—not more. Winter grain is not one-half what it was last year. Corn has come up badly on account of dry weather, but there is time enough to plant again and have a good crop yet. This is a good corn section. Fruit, I think, will be more of a failure than anything. What few sets there have been on the trees this spring, have been more or less blasted by cold, dry winds; but there will be some surplus fruit in these parts, as there is a great deal of land in orchards. There will be more pears than any other kind of fruit. Potatoes that are up, are well patronized by bugs, but our people are capturing them. On a single hill I got 150. There has been bad luck with sows this spring here: folks lost their pigs so that we are scantily supplied with swine. Pastures are not as good as usual, and there will not be as much butter sold this year as last. Stock came out well this spring; my herd of 10 cows are making 12 pounds of butter a day. They did better than that last year at this time. W. H. I.

JAMESTOWN, Chautauqua Co.—The season has been extremely dry and cold until about the first of the month, when we had rain in sufficient quantity to pretty thoroughly wet the ground. Since that time we have had frequent showers, but the weather has remained very cool, and on the morning of the 7th inst. there was a severe frost, that has done much damage along the valleys of most of the streams. Winter wheat, as a rule, is poor to medium, with an exceptional good piece. Oats promise a full average crop; corn was planted late, and has come up very unevenly, owing to cold and drought. Prospects at present are not very flattering. The prospects are that the apples on the high lands will probably be fully an average crop, unless they are blasted by cold winds. About the usual acreage of potatoes has been planted. Potato beetles promise to be a fine crop. Grass, where not injured by the recent frost, will be no more than a medium crop; many old meadows will be exceedingly light. Times are hard; the best butter sells at 10@15c. per pound, and other farm produce in proportion. W. C. G.

ROME, Oneida Co.—Wheat came out of the winter looking well, owing to the covering of snow that lasted about four months; but the severe drought of May is causing it to head out short and to look uneven. Spring wheat was a failure last year, and but little was sowed this year. Grass is about half a crop, owing to the severe drought. Oats look quite well. Corn is very small. Potatoes are well covered with bugs as soon as the vines are out of the ground. Apples blossomed full, and promise a fair crop. Strawberries and Currants are loaded with fruit. Grapes in exposed places were killed by the frost on May 20th. The weather is quite variable; on June 1st the mercury was up among the nineties; on June 7th we had some frost. Nice rains have fallen during the past week, and they are helping the crops greatly. In a ride of ten miles south to-day, I was surprised at the poor appearance of all kinds of crops, but if we have favorable weather henceforth, they will gain fast. F. D. P.

GENEVA, Ontario Co.—The spring is very backward. In the counties of Cayuga, Seneca, Yates, Ontario and Wayne the wheat and hay crops will not be more than a half yield. Spring crops look fair, but very backward. Fruit was injured in some localities by the late frosts, especially Strawberries. Cherries and plums promise well. Apricots and peaches bid fair to be a good yield. Pears look well, and the apple crop only middling. It is very cold and dry, and unless the warm weather comes soon, spring crops will be poor. Roses and shrubs never looked better, the cool weather has kept off the vermin so that they have had a chance to grow, and the lovers of Roses rejoice. J. H. S.

ALBION, Orleans Co.—The wheat crop in this section bids fair to be a full average one, perhaps the straw will not be as heavy as last year. Corn and potatoes are not sufficiently advanced to enable me to form an opinion as to their yield. It has been very dry, but recent rains are bringing up both these crops and the prospects are now much better for good yields than they were a week ago. I think, therefore, that we have good reason to hope for good fair crops of both. The fruit prospects are good for those orchards that did not bear last year. As many apple trees will not bear this year as last. Peaches and small fruits produce a good yield. J. G.

RURAL FARM, Queens Co., L. I.—We are having showers daily. Wheat that up to this time has looked splendidly, is now showing rust to an extent that may injure the crop materially. Rye, corn, potatoes and all vegetables are all that could be desired. Old hay, of which there is still a heavy stock, does not sell readily at 50 cents per cwt. and the present promise, which is about as good as fulfilled, of another fine harvest, will not tend to raise the price. Our Blunt corn plot, regarding which we indulged in "great expectations" is far behind other fields. We had counted upon a *dry* season—and we counted wrong.

CATHARINE, Schuyler Co.—It was very dry here up to June 1. We have had some fine showers since then. Not more than two-thirds of the corn planted is up, it has been so dry. Wheat is short and very thin on the ground. Will not be half a crop. Apples, cherries and peaches will not be more than half a crop. Pears are good. About the usual amount of potatoes has been planted. They have not come up yet. The prospect is that corn, wheat and grass will be poor this season. Oats and barley are backward and thin on the ground. J. S. H.

FRIENDSHIP, Alleghany Co.—The farmers hereabout are looking rather blue on account of the backwardness of the season. The weather has been very cold and dry. We have had frost to the injury of fruit in many localities, more especially in the valleys. Grass on old meadows is very light; that newly seeded is better. The usual number of acres of various crops has been sown and planted. Not very much old hay is left over. On the 10th and 11th we had the first rain of any amount for several weeks. W. A. H.

BYERSVILLE, Livingston Co.—Weather cold and dry. Some of the farmers in this section have plowed up their winter wheat. The remainder in this township, (West Sparta), will hardly yield an average of over five bushels per acre. Spring crops are very backward. Corn came up very unevenly and has grown but little. There was quite a heavy frost in the eastern part of the town on the 6th inst., which damaged the potato and corn crops quite badly. The prospect for an abundant apple crop was never more favorable. Grass is very short. N. K. D.

NORWICH, Chenango Co.—The season has been cold and dry, and is late, but within a few days we have had rain, and vegetation has changed materially. We have not much of a wheat country, having raised but very little till within two or three years. Now, however, almost every farmer raises enough for his own use. Potatoes that are up look well. Fruit has been killed somewhat by the frost. I think we shall have enough, however, for home use. H. H.

ANDOVER, Alleghany Co.—Late frosts have put everything back here. Wheat looks well

Corn is poor—won't be half a crop. Potatoes are late, but the farmers here planted plenty of them; beetles are abundant. The hay crop will be light here. I think fruit will not be very plentiful here. Apples and cherries will, I think, be good crops, but pears, peaches and plums will be light. Times are dull. Wages are from 50 cents to 75 cents per day. C. F. H.

HIMROD'S, Yates Co.—We have had a cold and dry spell here. It has not rained, to do much good, in six weeks, although it has been raining all around us. Crops look badly. Wheat will be a short crop. Spring grain has not started much yet. Corn is all planted, but it is coming up thin. Clover and grass will be short crops. Seed sown in the spring is all dried up. We shall have to replow this fall unless rain comes soon. G. A. B.

FREDONIA, Chautauqua Co.—During May and the last half of April it was very dry here, which gives us a light grass crop. Most kinds of grain look well. Small fruits and grapes promise full crops. Apples will be a full crop except where late frosts in the southern part of county cut them off. Copious rains during the past ten days have relieved the drought, and everything now looks promising. T. S. H.

SYRACUSE, Onondaga Co.—Spring very backward. Very poor prospects for winter wheat. Spring grains very poor. Corn nothing as yet. Barley is sick; so are oats. Fruits were injured by frosts. Potatoes are very backward but may come on yet. The worst prospects for the farmer in 30 years. No rain to amount to anything for five weeks. J. G.

ADDISON, Steuben Co.—We had quite a hard frost lately, killing all tender plants. Wheat is worth 90c. to $1; potatoes, 50c. and 60c.; oats, 40c. and 45c.; hay, $8; butter at groceries, 9c. to 11c. Although the outlook is not very good, yet farmers are putting the best foot forward. A. M. H.

BESEMER'S DEPOT, Tompkins Co. — On account of the backwardness of the spring and a drought through the month of May, wheat looks very poorly. Corn and potatoes are backward, but we hope for good yields yet. Fruit promises well, except apples which will be a light crop. J. B.

PENN YAN, Yates Co.—The winter wheat will be a light crop—not up to the average. Spring grain promises well. It is yet rather early to judge of potato and corn prospects. Fruit prospects are good—fully up to the average. E. M. B.

Pennsylvania.

DOE RUN, Chester Co. — Wheat generally looks well in this county. Some fields, however, are quite poor, having been injured by the hard winter and the fly last fall, the latter pest having been especially hurtful to early sown wheat. About the usual area has been sown, I believe. Corn is growing pretty well, and has not been injured more than usual by birds or insects, but it is yet too young to speak confidently about the success of the crop—the area under it is about an average one. Of potatoes nearly twice the usual quantity has been planted. In many patches they came up badly—not half thick enough. The potato beetle is doing considerable injury in some places where farmers are either careless or too busy to apply a remedy, and, on the whole, the prospect for a good potato crop hereabouts is not very flattering. The prospect for the hay crop is only middling. As to fruit: in this section the prospect for apples is not good. The fruit is but thinly set on the trees, and of some varieties there are none of any account. Although pear trees were full of blossom in many places, but few fruits are set. In some localities an abundance of cherries are set on the trees, while in other places but a few miles distant, there are very few on the trees, although the latter are young and appear to be thriving. Of this failure we cannot discover the cause. Peaches appear to be plentiful on the trees, but it is too early yet to venture on a prophecy about the crop, for last year the fruit rotted extensively on the trees, when nearly mature. Currants and gooseberries are being badly injured by the currant worms which appear to be getting more numerous and destructive every year, eating the leaves all off the bushes and in this way preventing the fruit from maturing. T. W.

PUGHTOWN, Chester Co.—Wheat is looking well; the usual area has been sown. Rye looks well too, but not a great deal of it is grown here. Corn is eight inches high, looks all right and came up regularly. Oats are as high as corn and the usual quantity has been sown. Clover is coming into bloom. All grasses are promising a good hay crop. No barley is raised here. Double the usual area has been planted to potatoes. The vines are now six inches high, and the Colorado pests are plentiful. Nearly every one uses Paris-green against them. Currant and gooseberry worms are here for the first time. Prices are: wheat, $1 15; rye, 60c.; corn, 50c.; oats, 30c.; old potatoes, $1; hay, $8 per ton; butter, 18c. to 20c. per pound; eggs, 14c. per dozen; chickens, 14c. per pound. We have just had two heavy rains, and some hail in some sections. There will be a few peaches and about a quarter of an apple crop. R. W. H.

AUBURN CENTER, Susquehanna Co.—The winter wheat is in general badly killed out, but has picked up a little since the rains. Corn is looking very well, but the weather is rather cool for rapid growth. A large acreage planted. If July and August prove warm, good crops are expected. Potatoes look well; if the bug does not destroy them, there will be a large crop—a great quantity has been planted. Fruit is scarce in this section, it being the non-bearing year; for other sections it looks more favorable. The hay crop looks well; pasturage is better than usual. A. S.

MCLELLAN'S CORNERS, Erie Co.—During the month of May the weather was very dry. We had several frosts, but not very damaging to growing crops. The general complaint among farmers is that their corn does not come up evenly. They are using more phosphate than usual hereabouts. Potato bugs are numerous. Wages are, by the day, for good hands, 75c., and $15 a month. Prices for produce are: for potatoes, 75c.; beans, $1 60c.; wheat, $1; corn, 50c.; oats, 30c.; butter, 10c. to 12½c.; eggs, 9c. Quite a number of our young farmers are going West. R. R.

EDGEWOOD, Bucks Co.—The prospect for wheat in this section is about an average one; it looked badly in the early spring. Corn has generally come up well, and is growing nicely. Oats must be rather short, owing to the dry weather. We have had good showers, however, within the past week, which may save the crop. Clover grass is very light. Late grass stands well, and is growing fast since the rains. Potatoes from good seed look well—many patches not half up. Fruit will be about an average. J. P.

EMPORIUM, Cameron Co. — The weather through May was mostly cold and dry. We had some frost, too. In June also we have had two frosts thus far, but neither has done much damage. We are now having plenty of rain. Wheat promises well. Corn and potatoes are in good condition. Fruit prospects are extra-fine, especially for pears and peaches. M. M. L.

CAMBRIDGE, Crawford Co.—We have been having plenty of rain and fine growing weather, but the severe frosts on the nights of the 6th and 7th inst., nipped the corn and potatoes on the lowlands, which before looked well. Wheat and oats will be light crops. Fruit prospects are not very good. This is a dairy country. T. T. R.

Ohio.

BUCYRUS, Crawford Co.—Taking the average of crops to be 100, then, according to the present prospects, wheat will be 120; corn, too soon yet to estimate; potatoes, 100; oats, 95; fruit, 65. I speak for this county only. Our rains during the last two weeks will bring the corn crop, at the start, to 100, without doubt. Dry weather caused a great deal of replanting, and this is not yet up—hence that "too soon." The prospects for oats and potatoes are very good, considering the dry weather. Just now our fruit looks rather light, but late rains may bring it up from 15 to 20 per cent. in advance of its present condition. The usual acreage of all crops is out. Grass is doing splendidly. E. G. C.

CHARDON, Geauga Co.—May having been very dry, the grass and wheat crops will be much lighter than was expected last spring. Wheat will be an average crop for this section, however. Early planted corn is looking well where the frost, on the night of the 7th, did not injure it. A great deal of corn was planted late on account of dry weather, but the prospects are fair. Potatoes looked well until the morning of the 7th, when they were badly frosted on low land, but not enough to spoil them. If the season is favorable, potatoes will be plentiful. There will be a moderate supply of fruit, but not half so much as last year. Everything is doing finely since the rain on the 1st of the month. A. T.

NAPOLEON, Henry Co.—Wheat never looked better—the great yield of last year promises to be equaled, if not surpassed. There was a large acreage sown last fall. Corn looks quite well. A great deal that was planted failed to come up, owing to poor seed. I think that this spring's experience will teach farmers to pick out their seed in the fall. Grass promises to be good; timely rains helped both it and the wheat very much. Oats are fair. This is the "off year" for fruit, but the prospect is that there will be enough for home use. Small fruits promise a good yield, Strawberries especially. Prices about as follows: corn, 30c.; wheat, 95c. to $1; potatoes, 60c.; butter, 7c.; eggs, 8c.; land, $30 to $70 per acre. V. J. E.

MILLERSBURG, Holmes Co.—We had no rain for 16 days prior to the 31st ult., but since that date we have been unusually favored generally, which is bringing vegetation on very rapidly. Wheat promises a fine crop and a larger acreage than usually has been sown to it. Corn cannot be a full crop, as much had to be replanted on account of worms or bad seed; but that which came on from first planting is doing finely. Oats are doing well, but not much was sowed. An unusual amount of potatoes was planted, and they are growing finely; bugs scarce. Only enough fruit for home consumption—quite unlike last year. The vintage will be abundant. G. W. M.

CARROLLTON, Carroll Co.—We have had very dry weather here this spring, until within the past week; since then we have had plenty of rain and growing weather. The wheat crop will be a very moderate one. It was partly winter-killed, and the dry weather kept it from stooling, so that it is pretty thin on the ground. A great deal of the seed corn did not grow, and what has grown is being badly damaged by the cut-worm. Potatoes will be a good crop if the weather is favorable. The prospect for fruit of all kinds is very flattering. G. H. A.

CHAGRIN FALLS, Cuyahoga Co.—The prospects are good for large crops of all kinds of fruit. Owing to the long-continued spell of dry weather, wheat will not be more than half a crop, as compared with last year. Corn, too, will probably be a light crop, though a very extensive area was planted to it, from the 3d to the 8th inst. A great breadth of potatoes also was planted; but it is yet too early to predict how they will turn out. Both the oat and grape crops will be light. It has just begun to rain, and if it continues a short time, it will help all crops wonderfully. E. P. M.

OMEGA, Pike Co.—The wheat crop is as good as last year—a good crop. Corn is generally a bad stand, and there has been much replanting; it is small for the time of the year, but looking well. Of Early Rose potatoes a great many have been planted, some farmers having 20 to 50 acres; they are looking well; the season has been favorable; they are now beginning to bloom. Apples will be a light crop. No peaches; the trees generally are badly winter-killed. Not many plums or cherries. Grapes, where protected, are setting well, but many vines have been killed to the ground. The blackberry crop is a failure; buds killed. J. B. R.

YOUNGSTOWN, Mahoning Co.—The stand of wheat was good when the freezing was over, but the drought has very materially injured its growth; perhaps there may be half a crop in this county. Corn is not coming up well, owing to dry weather, and more especially to frozen seed; but there may be time to make a good crop yet. Fruit was considerably damaged by late frosts, though not as much as when the ground and air are less dry. There will be a fair supply of the hardier kinds of fruit. Plenty of time for a good potato crop yet. J. H.

DELAWARE, Delaware Co.—Wheat acreage above average years; prospect good, except for that sown on corn stubble. Corn seed has been defective, necessitating replanting in many cases for a third time; backward on account of drought and cut-worms. Potatoes much affected by drought. Colorado beetles are more harmless than in former years. Fruit prospect good for apples and small fruits. Peaches a failure. Unprecedented drought during April and May. C. M. J.

PAINESVILLE, Lake Co.—Owing to a severe drought during the entire month of May, wheat is heading very short. Corn has not come up well for the same reason; much of it will have to be planted over. Potatoes are looking very well. We are having rain every day now for a week. The ground is well wet, so that the streams begin to rise. Peaches promise a good crop. Apples will be about half a crop, from present appearances. C. R. S.

TEDROW, Fulton Co.—The prospect for an abundant wheat crop in our county is good. There is an increased acreage, and wheat is heading nicely, with not too much straw. We have had considerable rain for a week past, but there are no signs of rust as yet. Corn is looking well, and a full average amount has been planted. Oats look well; so do potatoes. All kinds of fruit are fair, but not abundant. D. A.

FINDLAY, Hancock Co.—The prospects for a good wheat crop are the very best. Corn has been kept back by drought and failure to germinate; very much had to be replanted. Potatoes are hardly far enough advanced to form an opinion as to their yield. The fruit crop will be very short; very few apples or cherries and no peaches. Currants and gooseberries have been destroyed by worms; other berries are fair. D. B. B.

JEFFERSON, Ashtabula Co.—Wheat is 80 per cent. of an average crop. It is too early to form an idea of the yield of corn; it is backward, however, and about the usual amount has been planted. Of early potatoes a light amount has been planted; indications of a good crop are fair; bugs are not as numerous as for the last three or four years. There will be more than an average crop of all kinds of fruit. E. J. P.

MCCONNELSVILLE, Morgan Co.—The present indications are that wheat will be a good crop in this county. Fruit is a failure; there may be a few apples, however. The prospects for corn are not very flattering; a great deal has been replanted within a few days; the yield will depend something upon the outcome of the season. Potatoes are looking well at present, and promise a good yield. T. H.

WAPOKONETA, Auglaize Co.—We never had finer prospects for wheat. Corn has been a little backward on account of drought, but we have had enough rain to bring it out all right. The same may be said of potatoes, but never were more of them planted in our county than in the present year. Fruit prospects are good. S. W. M'F.

MILLERSBURG, Holmes Co.—Wheat moderately good. Corn prospect not flattering, on account of worms and dry weather, the latter of which has caused so much replanting. Potatoes are good—made so by our recent rains. The fruit prospect is poor, except apples, which will hardly be an average crop. G. W. S.

COSHOCTON, Coshocton Co.—The wheat crop will be good, but the straw short. Corn is coming up nicely; most of this crop had to be replanted. Potatoes promise a good yield, and fruit will average about half a crop. Oats will be a short crop—all owing to the drought. G. M.

SMITHFIELD, Jeff. Co.—The wheat crop is fair, but not near as good as last year. Corn is backward; as a rule, it did not start well. Oats and meadows are coming on well—prospects fair. The fruit crop will be light—peaches and plums mostly winter-killed. R. F. H.

NEW LISBON, Columbiana Co.—Owing to the very dry spell during the last month, wheat looks bad. Grass is very short. It is too soon to calculate on the corn crop. Early potatoes will be a failure. Fruit prospects are good. R. A.

PAULDING, Paulding Co.—Wheat is very good in this county. Corn is backward; we won't have more than half a crop. Potatoes are good—a full crop. Fruit also is good—an abundance of small fruits. Grass splendid. A. D.

GREENVILLE, Darke Co.—The prospects for wheat are as good as for years; those for corn are not flattering. It is too early yet to speak of the potato crop. The outlook for fruits is very poor indeed. W. S.

ATHENS, Athens Co.—In this county wheat is good and bids fair for more than an average crop. Corn is late. Potatoes are a good crop. Fruit is a failure, except as to apples, which will be about half a crop. J. B. A.

MARION, Marion Co.—The prospects for the wheat crop are good—better than the average. Oats will be a short and light crop. Corn prospects are not very good at this time. Fruit will be about an average crop. J. E. C.

WELLSTON, Jackson Co.—The peach crop is a failure in this section. Corn is being planted the third time. Wheat looks splendid. Oats were injured by the dry weather. Potatoes are doing finely. A. B. W.

Delaware.

CAMDEN, Kent Co. — Owing to late frosts and dry weather, the strawberry crop will not be over one-third. It has been very dry here until last week, when we had copious rains, accompanied by considerable hail, but not enough to do any serious damage. Blackberries and Raspberries were badly winter-killed, which will cut the crop down below the average. Grapes are promising. Apples, pears and cherries are scarce, but the slugs are abundant. Peaches will be an average crop. Wheat is looking well, but the fly is working on it in some sections; but as it will soon be ready for the reaper, no serious damage is anticipated from that quarter. Corn is standing badly; owing to the weather having been dry when it was planted, it did not come up, so that a considerable amount had to be replanted. The hay crop will be light, owing to the drought. This will cause considerable corn to be sown for fodder. Prices here are: wheat, $1.10; oats, 25c.; corn, 42c.; butter, 15c.; eggs, 12c.; potatoes, $1.25; day laborers, 75c.; by the month, $10 to $12. H. M. D.

ODESSA, New Castle Co.—The prospect for the wheat crop is good, but the acreage is not large. Corn looks well, and so do potatoes. Other crops are good also, all but peaches—of these there will be only about a quarter of a crop. Raspberries were badly hurt by the winter. Strawberries are a very short crop. The prospect for hay is fair. We have had three days of very rainy weather. E. C. F.

MILFORD, Kent Co.—The prospect for wheat is the best for ten years. Corn at present is looking well. Early potatoes are not so good, on account of recent drought. Peaches promise a fair crop. Apples, pears and cherries will not be so good on account of late frost. Apricots, plums and grapes were injured. Strawberries and raspberries are short crops on account of dry weather. C. C. S.

Maryland.

INGLESIDE, Queen Anne Co.—The prospect for the wheat crop is much better than it has been for years. No fly, or nearly none. The heads of wheat are excellent, as compared with the straw. On light lands it is said to be better than usual. Potatoes are pestered with the "potato bug," and are not doing so well. Corn is rather backward for this season of the year. Fruits are plentiful, particularly peaches; but there are fears of their dropping off before ripening. Peaches are the staple fruit here. C. H. J.

DENTON, Caroline Co.—The prospects in this section for both grain and fruit are, on the average, very encouraging. Wheat has a medium-sized head, well filled, and unless a long, dry spell comes, there will be a large yield of corn. We have about two-thirds of a crop of peaches on the trees, and in some instances a full crop, and the prospects for good prices for them are very encouraging.

W. R. E.

BROOKLANDVILLE, Baltimore Co.—Wheat, as compared with last year, will be 30 per cent. less in yield. Corn is looking fine. The prospect for a fine crop is good. The same may be said of early potatoes. Fruit, only fair.

S. B.

WESTERN STATES.

Indiana.

WINCHESTER, Randolph Co.—Present indications promise a more than average wheat crop with a large increased acreage over last year; in fact, some fields look as promising as they did last year at this time, and but few less so. Oats will be short, owing to the drought several weeks ago. The same remark applies also to the flax crop. We are now having some opportune rains which may bring both out, but not to a full crop. Corn does not promise so well, as nearly all has had to be replanted, since from some cause the seed failed to germinate, and we had but little weather warm enough to be good corn weather. Considering the extreme cold of winter and the cold and frosty weather during the first week of May, our fruit prospects are very fine. There will be a full crop of apples—as some trees are very full, while others have but few. Most of the pear trees are full; some young ones were killed by the winter, others were more or less injured; I shall lose about five per cent. out of 800 trees planted some five years ago; the Duchesse and Bartlett suffered most. Grapes are all more or less injured, either by the extreme cold last winter or the frost during the first week in May, so that there will hardly be more than half a crop. Strawberries are ripening and doing well. Raspberries promise a full crop. The Snyder Blackberry is the only one that promises a crop. A fine rain on the night of the 10th. D. E. H.

LA PORTE, La Porte Co.—After four hours' drive through our farming country and getting the opinions of some of our most reliable farmers, I should judge that the wheat crop will be above an average, and equal to that of 1877. I did not see a piece that did not indicate 25 bushels per acre, if the weather continues favorable. The above yield cannot be expected throughout the county, as in many portions the soil is naturally too light. The acreage of wheat, corn, oats and potatoes, is about the same as usual. There is a fair stand of corn. The hay crop is light. Apples, the same. Strawberries were somewhat injured by frost while in blossom, but will give a fair yield of large fruit. Mammoth Cluster promises well. The Kittatinny Blackberry is a failure in this vicinity. It can't stand the winter. Grapes promise everything; but we have no hopes of them on vines over ten years old, except on some ordinary varieties, such as Ives's Seedling, and the like. J. S. B.

ANGOLA, Steuben Co.—The prospect for wheat in this section is very good; the crop of straw, however, will not be heavy; but if the ears fill well, the crop of wheat will be rather above the average. Corn is a little backward here, owing to two causes; first, poor seed, and, second, the cold and wet weather which we have been having; the corn has a good, healthy color, and, should we have a favorable season with a late fall, I see no reason why we may not have an *average* crop, to say the least. Potatoes are looking unusually well at present, and are not, as yet, troubled very much by the bugs. The prospects for a good crop of fruit are most flattering, unless it be peaches, and I think they will not fall much below the average. Oats are not looking very well, but grass is light. M. F. C.

WEST LEBANON, Warren Co.—The crop prospects are very good. Wheat is better than ever before through the county, and a larger acreage is under it. Corn is doing well now; the farmers have replanted almost half the acreage. The replant is doing well; recent rains have removed all fears of a failure of corn in this region if we get rain in earing time. Small fruit is promising; also apples. The acreage is very large. The potato area also is very large, and the crop was never in so good a condition at this time of year. Oats are only ordinary; the weather was a little too dry after sowing. J. F. C.

INDIANAPOLIS, Marion Co.—After a discouraging drought of five weeks, we had a rainfall of from three to six inches, from the 1st to the 6th inst. Wheat is in *splendid condition.* Corn started poorly, and is backward; considerable replanting has had to be done. Cool weather following rains is very favorable for all crops, keeping the ground from baking, and improving the chances for the corn crop. Potatoes are doing well. The oat and flax crops will be very light. Small fruits will be in great abundance, and the prospect for apples is good. Farmers are in good spirits and driving their work. A. H.

MARTINSVILLE, Morgan Co.—The prospect for the wheat crop is at present very flattering, most farmers think the crop will be even better than last year's—better heads and less straw. There has been some complaint of the corn crop; a great deal of replanting has been done, a large portion of the seed saved from last year's crop proving bad. There is an excellent prospect for an extra-large crop of potatoes, notwithstanding the Colorado beetle has put in an appearance as usual. No peaches, and a light crop of apples. Small fruit in abundance. H. A. S.

CONNERSVILLE, Fayette Co.—We had this year the driest May known to the oldest inhabitant. This has been of vast benefit to the growing wheat, retarding its growth, etc., though damaging to corn, oats, hay and flax; of rye we sow but little. The recent rains have greatly improved the prospects of all our crops, and from present appearances, we shall have an unusually heavy crop of wheat, and fair average crops of corn, oats, hay and flax. Clover will be rather short, but good.

A. B. C.

GOSHEN, Elkhart Co.—Winter wheat never looked better; is very advanced; acreage, average. Most of the seed corn failed to grow. Replanting was necessary. The weather has not been favorable for corn. Potato prospect, good; but the potato beetles have begun to work. The high price of potatoes the past winter has increased the amount planted. The fruit crop, in which the northern part of our county is largely interested, bids to be very good. Apples are the only fruit not promising well. J. W. I.

RUSHVILLE, Rush Co.—Wheat is coming out finely since the late rain, and prospects are good for a splendid crop. Bad prospects for corn at present; many are just planting it for the second and third time. The dry weather and bad seed have been the causes of its failure. Oats and flax are very short; they cannot be more than half crops. No peaches or small fruit. Apple prospect an average one. Meadows are short. L. L.

VALLEY MILLS, Marion Co.—Wheat in our section is above the average condition, and the acreage is greater than has been cut for several years. The acreage of corn is less than last year and the crop has been kept back by drought, but there has been abundant rain the past two weeks, and it now looks well. Potatoes will hardly be an average crop. The prospect for apples is good. No peaches. There is a plentiful supply of small fruit.

A. D.

LEBANON, Boone Co.—The wheat prospects in Central Indiana are much above the average. Corn is late, but doing well. With a fair season from this on we shall have a full average crop. Potatoes and vegetables are fair, except that they are a little late. Apples are good; no peaches; small fruit not quite an average for our county. Times are much better than they were two years ago.

J. N.

ELROD, Ripley Co.—For wheat we had the finest prospect we have had for several years; but owing to dry weather through May, the crop has been reduced to about an average one throughout Ripley, Dearborn and Jennings counties. For corn we have a very fair prospect. Peaches are all killed, as are a great many of the trees, but of apples and small fruit, I think we shall have plenty. R. J.

KOKOMO, Howard Co.—In this county and section of Indiana wheat never promised better and the acreage is the largest ever sown. Corn is not promising—all the early planting having had to be replanted. Added to a bad spring, there seems to be a general defect in seed corn. Potatoes will be abundant, as will also all kinds of fruits except peaches. Peach trees were nearly all killed the past winter.

A. N. G.

WARSAW, Kosciusko Co.—Wheat is looking well; there is a large acreage and the crop will be immense. Corn is somewhat backward, but a good yield is always the rule in this section of the country. Potatoes are doing well. Fruit will be a failure so far as peaches are concerned; apples will be about half a crop.

N. H. P.

BOONVILLE, Warrick Co.—Wheat is extra-good. Harvest begins about the 20th inst. The prospect for corn was never better, and it has the largest acreage ever planted in this county. Peaches are very scarce; apples, one-fourth of a crop; no cherries. Early-planted potatoes are good. Tobacco will be two-thirds of a crop. R. W.

LA PORTE, La Porte Co.—From present indications the yield of wheat in La Porte county will be the largest ever known, and is estimated at from 800,000 to 1,000,000 bushels. Corn and potatoes are not sufficiently advanced to base any judgment upon their appearance, but the acreage is as large as on former years, and both are looking well. H. C. S.

ROME, Perry Co.—Wheat in bottom lands looks well; on uplands, short, owing to dry weather. Corn is backward. The apple crop is fair; of peaches there will be none; small fruits, ditto. Oats very short. Hogs healthy. No potatoes planted yet, but a larger crop than usual will be put in. I. L. W.

FORT WAYNE, Allen Co.—The wheat crop in northern or northeastern Indiana never looked more promising at this season. Meadows will be light. Corn is backward; much of first planting failed. The fruit crop is fair, except peaches and cherries. On the whole, farmers' prospects are good. J. D. G. N.

NEW-CASTLE, Henry Co.—The outlook for wheat was never better in this county. The drought in May did it good, while it was an injury to corn, oats, hay and flax. The recent rains have brought the latter out splendidly. The fruit crop will hardly be half the usual one. R. M. N.

NEW HARMONY, Posey Co.—The wheat crop was never looking better in this county than now; much of it will be ready to cut by the 12th inst. Owing to drought, corn has not come up regularly, but recent rains are making it all right. A good prospect for fruit except for peaches. F. D. B.

COLUMBUS, Bartholomew Co.—The wheat crop is somewhat injured by drought, but it will be above an average. Corn is backward. No peaches; the prospect for apples is splendid. Potatoes, too, were injured by drought and by the Colorado beetle. Oats and hay will be short. J. D.

PORTLAND, Parke Co.—Wheat in this county bids fair to be more than an average crop. There is a great deal of complaint on account of the failure of corn; as a general thing, it has rotted in the ground. The fruit crop is promising. G. W. M.

BROWNSTOWN, Jackson Co.—Wheat will be about an average crop; corn, less than an average. Early potatoes, more than an average. No peaches; an average crop of apples.

W. L. B.

Illinois.

WHEATON, Du Page Co.—The weather has been alternately dry and cold and dry and warm, with an occasional shower. The ground was never in a worse condition for planting than this spring, turning up in great, hard lumps when plowed. Owing to this and to poor seed most of the corn has had to be replanted. With a good season we may yet have tolerable crops. Small grains look fair. Rye and what little winter wheat there is, will be very fair crops. Potatoes are extensively planted and look well. This county is the home of the Richmond cherry of which there is a fair crop now beginning to ripen. Other small fruits will be plentiful. Late frosts, after the buds began to swell, will have shortened the grape crop. We are having a gentle and much needed rain now. O. F. R.

WAUKEGAN, Lake Co.—The dry and cold weather we had this spring, kept crops back considerably; but recent rains have started them so that they are looking much improved. There is but very little wheat raised here. What is sown is looking well now, but the chinch bug may destroy it. Oats are fair. Some corn is well up and cultivated out; other fields have just been planted. The weather is too cool for it to look healthy; a large area has just been planted. Potatoes are looking well—lots of beetles. Fruit will be a light crop. A great deal of flax has been sown—some looks well; some, poorly. N. S. H.

PRINCEVILLE, Peoria Co.—In the immediate vicinity of this place, we have had uncommonly dry weather since April 20—only about four inches of rain. Wheat is nearly a failure. Corn will be about an average crop. Oats may be half a crop, but the straw is too short to bind. Potatoes are looking tolerably fair, except that they wilt in the middle of the day. Fruit will not be over half a crop. Pastures are very dry; some are obliged to pasture their mown ground. M. L. B.

KANKAKEE, Kankakee Co.—The prospects for wheat in our county are splendid, both for the winter and spring sorts. Winter oats are especially fair. The farmers have had trouble with their corn seed; nearly all have had to replant, but it is now generally up, and, with seasonable weather, the crop will be good. Potatoes look magnificent; the yield from present appearances will be heavy. Grass is rather light. Fruit will be about an average crop. J. M.

CARROLLTON, Greene Co.—Prospects for wheat are good; for corn, good; for potatoes, very good; for fruit, very poor, as far as Greene county is concerned. Timothy meadows are very short; clover fields, good.

N. J. A.

Michigan.

JACKSON, Jackson Co.—Wheat is looking fair, not very rank, but well rooted by the cool weather of spring. The acreage in Michigan is not as great as last year, nor is it looking as well. There is little complaint of damage by the Hessian fly. Many have been obliged to replant their corn, especially those who planted early; but the moist, though rather too cold, weather of the past two weeks is bringing it forward nicely. Not many potatoes are being planted, but those which are up are looking well. Potato beetles are still with us and are fought with Paris-green. Fruit crops were damaged little, if any, last spring by frosts, but apples hereabouts did not set very full. Peaches are a fair crop. Pears have a good showing, if we escape future disaster. Plums will do well if the curculio is successfully fought, and grapes look finely.

R. T. McN.

LANSING, Ingham Co.—Wheat promises only about three-fourths of a crop, owing to a prolonged drought in May. Corn is backward and a poor stand. Some has been replanted. Potatoes are looking well; but they were slightly cut by frost on the mornings of June 6 and 7, in low places. Grass will be light—not over two-thirds of a crop, and pastures were poor till June 1. Small fruits will be an average crop, if rains are frequent from this time forward. Apple orchards hardly show what the yield will be at this time. C. L. I.

CHARLOTTE, Eaton Co.—Wheat promises hardly an average crop; it is rather thin, and the fly is pretty busy. Corn is looking first-rate, except on an occasional field where the worms have been at work. Potatoes and oats are very fine. Cherries, peaches and apples will be abundant. T. M. F.

BAY CITY, Bay Co.—Wheat prospects are good in this section—too early to speak definitely about other crops yet. D. C. G.

Wisconsin.

LAVALLE, Sauk Co.—The season has been rather backward, with occasional rains, but not sufficient until May 24, when it rained copiously, and corn that was not planted had to lie over a week or more. Crops look well, and the prospects are good for fair yields. Wheat is worth 60@90c.; corn, 40c.; oats, 25c.; barley, 35c.; butter, 6@11c.; wool in the dirt, 20@25c. The acreage under hops is small, but what are poled, look well for the season; prices nominal. Land is worth from $10 to $40 per acre, according to improvements and situation. W. S. H.

SARATOGA, Wood Co.—Wheat looks very promising. A large area has been sown and a full crop is expected. Owing to cold weather, corn is rather backward. A slight frost on the morning of the 7th alarmed the fears of many; no damage was done, however. All kinds of fruit were badly damaged by late frosts; consequently the yield will be light. The weather is dry and warm at present.

J. J. H.

EVANSVILLE, Rock Co.—We had quite a severe drought early in the spring, lasting until May 28, when heavy rains changed the aspect entirely. The crop of small fruit will be good. Apples will perhaps yield 50 per cent. of last year's crop. The prospects for wheat, late oats, corn and potatoes, are good. Early oats are too thin for a crop. Clover is short, but a heavy yield of timothy is expected. G. B.

DARIEN, Walworth Co.—Crops of all kinds look very well in this region at this date, although they are a little late in consequence of dry, cold weather, during the latter part of April and beginning of May. Prospects for the large fruits are poor. Strawberries are just beginning to ripen—a good crop. Cherries are scarce. W. H.

MADISON, Dane Co.—Wheat is growing well, but is thin on the ground. A good deal of complaint is made of seed corn rotting in the ground. No fruit in this vicinity.

G. E. B.

Minnesota.

LE SUEUR, Le Sueur Co.—The wheat crop never looked better than it does at present, both on prairie and timber land. We have had abundant rains, warm days and cool nights. Corn is well up and looks healthy. Farmers in this section have planted an unusually large acreage to potatoes. The crop looks well and promises a heavy yield. No beetles at present writing. Very little fruit is raised in this county, comparatively speaking, but apple trees of the hardy kinds are loaded with fruit. Last year the heavy frosts killed all the fruit, but this season we have not had any hard frosts, and small fruits of all kinds look well. I received some of the Blunt Corn, planted it in my garden without any

extra manure. It is now 18 inches high and grows faster than any corn I ever raised. G. D. S.

LITCHFIELD, Meeker Co.—Our spring has been early and everything is well advanced. From reports from other parts of the country in the RURAL, I judge we have been at least two weeks ahead of New York and New England. I have oats over a foot high, and potatoes nearly ready to blossom. Wheat never looked better. Corn is well up. All kinds of fruit promise well. G. W. F.

Iowa.

BISMARCK, Clayton Co.—The spring with us was unusually dry until May 24, when we had a good shower followed by heavy rains on the 25th and 27th of that month. In the timber regions of northwestern Iowa wheat—winter and spring—cannot make over three-quarters of an average crop. On the prairie region it looks fairly well, and will make an average crop. There is a decrease in acreage of about 10 per cent. Corn is backward. Much of what was planted did not sprout, and had to be replanted. We cannot expect an average corn crop without a very favorable season from this on. There was an increase of acreage planted of at least 15 per cent. Oats and barley have a smaller acreage than usual. In the prairie region both look fair; but in the timber and clay regions, they look poorly. Prospects for potatoes are good, with a larger acreage than usual planted. The bugs are appearing, but not in force yet. Apples will be about half a crop; small fruits, generally fair. The weather has been too dry for strawberries. Hay will be a short crop. Pastures were poor previous to the rains; but they now afford a good bite. On May 30 my son got home from a trip through Iowa into Dakota and northern Nebraska. He says that in northeastern Nebraska there has been no rain since last October, and vegetation throughout that whole region is badly dried up and crops will be short, except, perhaps, in two counties, in northwestern Iowa, where there had been timely rains. Prices are: wheat, 45@80c. per bushel; corn, 30@35c.; oats, 22@25c.; barley, 25@40c.; potatoes, 45@55c.; live hogs, $2.75@3 per 100 lbs.; cattle, $2@4.50. J. E. C.

FAIRFIELD, Jefferson Co.—Propitious rains have been conducive to the growing crops in this county, and all are doing nicely. The stands of corn, wheat, oats and rye, are excellent. More acres than heretofore are in cultivation, and the indications are at present that good, old-fashioned crops will be harvested. The crop of grass will not be excelled. The potato crop is large in acres, and promises an abundant yield. Very few beetles have appeared. Small fruits, with the exception of grapes in some localities, are plentiful and the quality unsurpassed. Apples and cherries will be fair crops, though damaged by the cold and wintry winds of early spring. Peaches will be very scarce—trees killed by the severity of our cold winter. Should the weather prove favorable for a few weeks longer, we shall have no cause of complaint of what the fields and orchards will give us, and another good harvest will make our people happier and more contented than they have been for a long time. J. R. S.

DAVENPORT, Scott Co.—Since the rains on the 15th of last month, the prospects hereabouts are good for immense crops. Wheat is looking splendid, and I think it will be an enormous crop. Corn, too, is very fine, but small for this time of year. There is a good stand and the weather has been favorable to work it and keep it clean. Potatoes are looking first-rate, and I think will be a big crop. The rain that is falling as I write, is just in time for them. The onion crop here bids fair to be immense. The fruit prospect is not very bright; there will be very few apples and cherries, and other small fruits are about half a crop. G. W. S.

BENTONSPORT, Van Buren Co.—Winter wheat is promising a full crop. Rye is about three-quarters of a crop. Corn is a good stand and the ground is clean, promising a full crop. Potatoes, also, promise a full crop. Oats, spring wheat and hay are from a half to three-quarters of a crop, it having been too dry in April and May. Apples are from half to three-quarters of a crop. Grapes that had been winter-protected are half a crop. Of pears and peaches there will be none—the trees are badly injured. Small fruits will be few. Garden vegetables look fine. C. R.

PELLA, Marion Co.—We have had plenty of rain, and everything is growing finely. Corn never looked better, and is entirely free of weeds. Small grains look well. Potatoes promise a full crop—there is no trouble with the Colorado beetle this year. Fruit of all kinds will be a very short crop. Blunt's corn is growing finely, and so are all the other seeds sent out by the RURAL. C. & B.

VALPARAISO, Porter Co.—The crop prospects for wheat in this county are better than usual, and a large acreage is under it. Oats are rather backward. A very large area has been planted to potatoes and they promise well. Times are mending, and farmers are hopeful. S. W. G.

CHARLESTOWN, Lee Co.—Wheat prospects are good. There was not a good stand of corn, on account of dry weather; but the prospect is better now. Potatoes are fair. Peaches are a failure. Apples will be half a crop. Oats are short, and so is grass. M. B. C.

Missouri.

ROCKSVILLE, Bates Co.—The prospect for corn has never been better. The outlook for wheat is for a medium crop; it was winter-killed badly. What remains is filling nicely, and will be harvested about the 15th inst. Oats are medium. Early potatoes are good; late potatoes have only just been planted. There will be no fruit except grapes; the vines are loaded. We had a late freeze that killed the other fruit. J. N. C.

COLUMBIA, Boone Co.—Wheat promises well—straw short, but heads well filled. None but winter wheat is raised here—Fultz and Clawson are the best. Corn is suffering from drought. Potatoes are poor also; we used the first on June the first. Fruit of all kinds are a failure, on account of severe winter and late spring frosts. Peach trees are mostly killed. Began cutting wheat June 9th. S. M. T.

Nebraska.

BROWNVILLE, Nemaha Co.—Wheat is not as good as usual, fall wheat particularly. As a rule, it was planted too late last fall, and therefore was not in good condition to pass the winter ordeal and that of a very dry spring. Spring wheat, for the latter reason, is not as good as farmers desire; but, on the whole, it offers a very fair prospect. The increased acreage this season, in all small grain crops, will more than make up for losses in yield. The potato acreage is smaller this year than before, perhaps, for several years. Crops having been good and prices low, less attention was given to this crop this season. The general fruit crop is short with us this year. The apple prospect is fair; in fact, some of the more reliable varieties are showing fruit, such, for instance, as Ben Davis, Wine Sap, White Winter Pearmain and Rawle's Jannet. Cherries are a moderate crop. Peaches are nearly an entire failure, though some trees, in favorable localities, show a fair crop. Of plums, apricots, prunes and nectarines there will be none. Grapes will be abundant. Strawberries started out with an elegant showing, but seemed to blast when fruit should have set. Blackberry plants were injured last winter, and show scarcely any fruit. Corn, while in some respects somewhat backward, is a good stand, and affords most favorable prospects. R. W. F.

CRETE, Saline Co.,—I have just returned from a two-weeks trip in parts of thirteen Western and Middle States, and I have closely observed the crops. While all crops in Nebraska are as good as, and in many cases better than, those of other States, I think our crops here this year will be below the average, for this State. On account of the dry weather in April and the first half of May, and the appearance of the chinch bugs, the wheat crops will not turn out more than from six to ten bushel per acre, in my opinion. Barley is thin, heading very low and will hardly pay expenses. I never saw a more even or finer stand of corn than in Nebraska. Frosts on the 5th and 6th of May injured the peach crop. Potatoes at present look well. During the latter part of May we had fine rains. The amount of rainfall for the month was three inches. Although the yield of small grain will be less than usual, the increased acreage will enable Nebraska, to turn out more marketable products than ever. H. M. W.

BROWNVILLE, Nemaha Co.—I have just returned from a trip over this county, and I think I never saw the growing crops look better at this season of the year than now. The rains of a few weeks ago revived things wonderfully, and the present cool weather will make the fall wheat (now in the blossom) fill splendidly. Spring wheat is thin on the ground, owing to dry weather in the spring. Corn never looked better. Fruit crop: small fruit, good; apples, fair; peaches, light. Nemaha county has suffered neither from drought nor storms. The harvest fly—sometimes called the 17-year locust—will do some damage to young timber, probably, but it will be very slight. S. A. O.

YORK, York Co.—We have in this county as good prospects as we ever had for fine crops of all kinds. More wheat and corn have been planted this year than at any period before, and the prospects now are good for splendid crops of both. No storms of hail or rain, although we have had severe ones, have damaged these crops at all. Potatoes are troubled somewhat with the Colorado beetle, but not more than usual. But little fruit is grown here yet, men having neglected planting until within a few years. Barley is looking well. Oats are not quite so well as usual. The weather continues fine. We have rain enough to make everything grow well. J. B. R.

PURPLE CANE, Dodge Co.—We have had an extremely dry spring—all small grains are short and thin, and heading out weakly. Corn is late, but quite fair. Potatoes are flourishing. The prospects for a fine crop are good. Grass is short and thin. The weather has been rather cool for the season, throughout—much wind. Strawberries are poor for want of rain. Raspberries are excellent. The soil is so dry and hard as to seriously check breaking. Many of our hardiest trees were killed by last winter's cold. Stock is in very fine condition. Prices of produce are entirely too low. Plenty of young grass-hoppers are doing much damage. There are few potato beetles. S. R. M.

GIBBON, Buffalo Co.—Winter wheat is heading out and looks well, but not much of it was sown. A large acreage of spring wheat was sown, and it gives promise of a bountiful harvest. I have never seen a better prospect. Double the usual amount of corn has been planted. It is a good stand, and has been plowed the first time. Potatoes are not looking as well as last year, and the Colorado beetle is busy depositing its eggs. Plenty of seasonable rains. The prospect never was as bright in western Nebraska as to-day. I have been in the State eight years. S. C. B.

SYRACUSE, Otoe Co.,—Wheat is half a crop. The stand is thin. Winter wheat is filling well. Barley, light. Oats, light; Corn was never better. The stand is good, clean and thrifty; acreage, as large as usual. Potatoes look well, clean and thrifty—acreage large. First new ones on the 9th inst. Early Rose average 23 to the hill. The fruit crop will be light. This is our "off year" for apples. There will be but few peaches. Strawberries, almost a failure. Raspberries show well. Grass and cattle are in good condition. Hogs are healthy. H. T. V.

FAIRBURY, Jefferson Co,—All kinds of small grain promise good crops, especially winter wheat. The warm weather in May checked the spring wheat somewhat, but abundant rains have brought it out all right. Corn was never better—a good stand, and growing well. Fruit gives first-rate prospects. Fruit-growing is in its infancy as yet, but such orchards as are old enough to bear, are loaded with fruit. Small fruits are good. Stock—our specialty—is looking well. Grass is good. A heavy immigration is pouring into this valley. W. W. W.

PEBBLE, Dodge Co.—Wheat looks well; so also do all small grains. Corn never was better at this season of the year, and it is an uncommonly good stand; there is hardly a hill gone in a field of 75 acres near me. Potatoes are good, but were frosted a little—no bugs. This year in this region there seem to be no insects except a few grasshoppers, and they are doing no damage. Plenty of rain, and the farmers all feel happy now at the prospect of such good crops. A. E. M'C.

SEWARD, Seward Co.—Our prospects for good crops of wheat, oats and barley are just about fair at this date. Corn is particularly promising. Of course, it is yet too early to feel certain as to just what the final results will prove with the various crops, as very much will depend upon the kind of weather we get during the next 30 days, with small grain particularly. E. MCI.

SALEM, Richardson Co.—The prospect for fall wheat is excellent. Harvest commences about the 19th inst. Spring wheat is a fair average crop. Corn is in fine condition, and if the weather is seasonable it will be the best ever raised here. Potatoes are good. Fruit will be short—about a quarter of a crop. Grapes, good. J. C. L.

TECUMSEH, Johnson Co.—Wheat was somewhat hurt by dry weather early in the spring, but has recovered somewhat. Corn and potatoes never looked better—all clean and growing nicely; both need rain now, but they are not suffering. J. S. & D.

TEKAMAH, Burt Co.—The prospects for crops in this county are very flattering. All small grains are looking very well, while corn is an excellent stand and growing nicely. We have had plenty of rain. The acreage under crops is large. W. B. W.

WAHOO, Lumkin Co.—Crop prospects here are good. Weather favorable—plenty of rain, and all are hopeful. By the way, this is the "Garden spot of the West." H. D. P.

Kansas.

SENECA, Nemaha Co.—Winter wheat is all headed out, and the grain in the earlier varieties is "in the dough." In some portions of this county, a severe hail storm about the 5th inst. greatly injured the wheat and other crops. Where not injured by this terrible storm, winter wheat promises to be rather better than an average crop. The same may also be said of spring wheat, which is now heading. There is plenty of chinch bugs, but the rain storm has discouraged them for the present. Oats are a good stand, and look well; but some pieces are threatened with rust. The tops of the early potatoes got terribly battered with the storm, and so also did the young corn, but they are recuperating fast, and both give promise of good crops. Peaches, no crop. Apples, a light crop; strawberries, the same. Raspberries and blackberries, a little better. Grass, A No. 1. G. H.

ALMA, Wabaunsee Co.—Fall wheat will not make over 15 bushels per acre on an average for this county. Spring wheat and oats will be total failures or nearly so, according to locality: cause, extremely dry weather in this locality—but two rains since last September; these came about the middle of April; none since to date. Early potatoes will make no yield, from the same cause; late ones will probably make a crop, if we have rains. Heavy, hot and dry winds come from the south continuously. Corn is looking well with a good prospect for a crop, if we get rain in the next two weeks. As to fruit, we had on the last of February a warm spell that started the sap, followed by extremely cold weather; the consequence was that the fruit buds were killed on nearly all apple trees, and on peach trees, wholly so. The same was the case with Cherries and Plums. Blackberries were killed to the ground, and Raspberries badly damaged. Gooseberries and Currants are failures from the same cause. Strawberries, too, in localities where there was no rain, were a failure. The prospect for a crop of grapes is good. Immigration is the heaviest since I have been in the State (over eight years). In some localities there have been seasonable rains so far this season. W. S.

MILFORD, Davis Co.—Winter wheat in this region will not exceed half a crop. Spring wheat does not promise well—some pieces have been badly rusted for two weeks. Corn and potatoes now promise well; corn stands more than usually well, and a very large acreage has been planted. A slight frost nipped the corn leaves on the lowest river bottoms slightly on June 2d—something I have never known to occur so late in the season before. Fruit prospects in this vicinity are not good. Very few apples; few peaches—many peach trees were killed. The cherry crop will be light. Grapes look well. Light crops of strawberries, raspberries and blackberries. E. G.

BURLINGAME, Osage Co.—Wheat harvest will probably commence next week. Owing to late frosts and dry weather, this spring, it will hardly yield three-fourths of an average crop; the grain will be good and plump, though. The prospect for corn is excellent; a larger acreage than usual has been planted. It is a good stand, of good color, and free from weeds, as a general rule. Potatoes, about 10 per cent. below average. The same frost that injured wheat, killed the fruit buds. Peaches, none; apples, a quarter of a crop; cherries, half a crop; small fruit, none to speak of. M. B.

LARNED, Pawnee Co.—Our crops are bad enough. We are suffering from lack of rain. No rain to speak of for *twelve months*. Our fall wheat is almost an entire failure. Summer crops also are suffering, and unless we get rain soon they will be a failure. Corn looks well, now. Oats, barley, flax, millet and Hungarian were extensively sown. An unusually large area was also planted with potatoes and other vegetables, but they must have rain soon. This county is too new for fruit. J. W. A.

LAWRENCE, Douglas Co.—Wheat will be just about a half crop. Oats are almost a failure. The prospect for a corn crop now is good—*above the average* at this season of the year as compared with other late years. Early potatoes are a fine crop; apples will be a half crop. Peaches, a failure. Cherries, almost a failure. Strawberries, a very short crop on account of dry weather about ripening time. Blackberries, none, canes badly winter-killed. Raspberries, a very short crop. J. T. W.

PAOLA, Miami Co.—Wheat straw is short, but the ears are well filled—probably three-quarters of an average crop. Corn prospects were never better at this date. The spring being dry, it was well planted and cared for. Oats are a full average. Potatoes, fully up to the best. Fruit prospects, bad; the winter being very severe, killed peaches and nearly all small fruit. Apples will be about half an average crop. Immigration large, and business good. H. M. M'L.

PEABODY, Marion Co.—Wheat will not average over 50 per cent. of last year's crop. Corn is 100 to-day; it needs rain badly, though; and unless rain does come in ten days it will be seriously damaged. Potatoes are at a stand; young ones have set on early varieties, but the weather is too dry for them to mature. Peaches won't average five per cent. of last year's crop; apple trees are too young to bear much. There will be some, however. Grape vines are well set with fruit. J. H. C. B.

ABILENE, Dickinson Co.—The winter wheat crop in this section will not be over one-half of last year's. Harvest is in full blast now. Corn looks fine and about four times as much has been planted as in any other season. Potatoes are looking well. Peaches are a failure. Small fruits promise well; apples also. The season is rather dry so far. J. B. E.

EDGERTON, Johnson Co.—Although in the midst of a protracted drought, crops are looking remarkably well. Corn is generally a good stand and clean, and there is a larger acreage than usual planted. Wheat and Oats are looking well, although they need rain. Flax—of which there has been a considerable amount sown—does not promise so well. Corn is worth 28c. per bushel; wheat, $1; hogs, $2.80 to $3. With these prices we have no room to complain. A. B. D.

OSKALOOSA, Jefferson Co.—There is an increased acreage under wheat and the yield will be fully up to the average. Corn prospect excellent—a large acreage has been planted to it, and all is in fine condition, the season having been favorable for tending it. Potatoes, good. Apples, one-third of a crop; other fruits, nearly a failure. E. S.

LARNED, Pawnee Co.—It is very dry here, so much so that all oats, barley and millet are drying up. Corn looks well and grows finely, though some pieces roll somewhat in the heat of the day. Wheat is not over one-fourth of a crop in this county, according to present indications. Harvest has just commenced; some pieces will yield about 15 bushels per acre.

S. S. D.

TROY, Doniphan Co.—Fall wheat will average 15 bushels per acre in this county; spring wheat not more than 7½ bushels. The prospects are that apples will be three-quarters of a crop; peaches, a failure; small fruits not more than half a crop. Potatoes will be a full crop. Barley and oats are in good condition.

T. W. H.

NEOSHO FALLS, Woodson Co.—The wheat crop never was better. Of corn a large acreage was planted: it looks well, but needs rain. Early potatoes are nearly a total failure. Fruit is considerably below the average, owing to frost in March. With rain soon we anticipate generally good crops. R. P. H.

GIRARD, Crawford Co.—The wheat acreage in this county is small, but the prospect is fair for a good yield. The corn prospect is extraordinarily good. There is an extra-good stand and the crop has been well worked. Early potatoes are good. Fruit will be an entire failure, except grapes, which are very fine.

J. B.

TOPEKA, Shawnee Co.—The prospects for wheat, corn, oats, rye, potatoes and all kinds of small vegetables are good. Wheat will be ready for the reaper about the 20th instant. Fruit of all kinds will be short—no peaches. The weather is very fine and the general health good. This is meant for this county only.

J. J. F.

CONCORDIA, Cloud Co.—The crops have been injured somewhat by the storm and hail on the 30th ult., but corn and potatoes will wholly recover, and the wheat will make three-fourths of a crop—say an average of 15 bushels per acre. There will be an abundant supply of peaches and small fruit, but no apples.

J. E. S.

HUTCHINSON, Reno Co.—The prospects for good crops this year is very poor. Wheat and oats are almost entire failures. The corn crop looks very well, but grass-hoppers are destroying it in localities. The counties in the southwestern portion of the State will not raise enough for bread and seed. E. S. H.

JUNCTION CITY, Davis Co.—Owing to the dry fall the wheat crop will be short—not more than one-half. Corn and potatoes at present bid fair to be large crops. The unusually cold winter for this section destroyed nearly all the fruit, except small fruit.

A. P. T.

OLATHE, Johnson Co.—Wheat is about half a crop—about 10 bushels per acre. Corn never looked better at this season of the year. Potatoes will be far above an average crop, if nothing happens in the latter part of the season. Fruit of all kinds is an entire failure.

J. M. G.

MOUND CITY, Linn Co.—Wheat is half a crop in quantity—quality above the average. Corn promises well—very clean and in good condition. Early potatoes are poor; late, can't tell. Fruits of all kinds, except grapes, are almost a total failure. A. F. E.

EASTERN STATES

Maine.

SKOWHEGAN, Somerset Co.—We had a backward spring; consequently, our sowing and planting were both late. We have had considerable rain during the first ten days of June, with cool weather and several frosty mornings. Wheat and corn have generally come up well, but make slow growth. The acreage of wheat is on the increase. Potatoes are just breaking the ground. The beetle is abundant everywhere. The apple crop is very promising; many trees that bore well last year are full again this year. Our recent rains have given the grass a wonderful start, and the hay crop will probably be equal to any for several years. Wages by the season are $12 to $16. Butter is worth 12 to 15 cents per pound; eggs, 11 cents per dozen, store pay; round hogs, 5 cents; hay, nice, $10 per ton. J. H. L.

NORWAY, Oxford Co.—Recent rains have made the prospect for hay very flattering. Corn is badly injured by frost, and presents a very discouraging aspect. Wheat and oats look well. Rye and barley are not much cultivated here. A fair crop of apples is anticipated. Pear trees have fruited abundantly. Grapes wintered uncommonly well, and are laying out a big season's work, though they are backward. The issue of the war going on between the farmer and the beetle will decide the fate of the potato crop. U. H. U.

New Hampshire.

TAMWORTH, Carroll Co. — Winter wheat was somewhat winter-killed hereabouts; spring wheat is doing well thus far. Corn and potatoes are just coming up; potato beetles are loitering around waiting for the coming crop. The apple blossoms were abundant, and fruit has set well, but the extremes of heat and cold we have, will, I fear, injure the crop. There was a heavy frost the morning of the 8th inst. No other fruit is grown to any extent in this section. H. A P.

SEABROOK, Rockingham Co.—Not much wheat near here. I think there are more corn and potatoes planted here than last year. Potato beetles are in great numbers. Potatoes planted early look well, those planted late are not up yet. Pears and peaches promise well. Apples blossom pretty well, but are blighting badly, and it is more than probable the crop will be light. Currant worms are very destructive both to Currants and Gooseberries.

E. L. G.

HUDSON, Hillsborough Co.—The prospects are good for corn and potatoes. Little or no wheat is raised in this section. This is the "off year" for apples, yet there is a prospect of a fair crop. Pears promise an abundant yield. A. E. C.

Vermont.

BURLINGTON, Chittenden Co.—The month of May gave us no rain, and at its end we began to fear the consequences of the drought; but the first day of June brought us fine showers, which have continued frequent. The weather has been cool and cloudy. We had damaging frosts in this vicinity on the last week of May, injuring early crops to some extent in some localities. The apple crop will be fair. Corn looks well and promises a usual crop. Potatoes are growing well, and will doubtless be a large crop if the bugs do not cut them down, which is feared, plenty of them having appeared. Paris-green will be freely used if no better substitute is found to destroy them. This is not much of a wheat-growing country. A few farmers grow enough for their own use; but all sowed grains are looking well. All things considered, we look forward to a gratifying harvest. C. C. P.

VERNON, Windham Co.—The season opened in this county about two weeks later than usual. Some warm days, but much cold weather. Rye is in blossom and looks well. Not much winter wheat is raised here. More spring wheat was sowed than formerly, and it looks well. Oats were sown late, but they have made a good start. But little corn has been hoed yet—some farmers have just finished planting. A larger acreage of potatoes has been planted than last year. The beetles are out in full force, and we shall be obliged to use Paris-green to save the crop. For the "off year," the fruit prospect is good; there was a good show of blossoms. A frost on May 24th injured the grapes very much in the valleys. Copious rains of late give promise of a good hay crop. If the balance of the season is favorable we shall have a bountiful harvest.

J. C. A.

NEWPORT, Orleans Co.—I find a sudden change in the weather. It is cold enough for mittens in out-of-door work. Grass is looking well, and my June-grass, orchard-grass and clover are ready for the scythe. Corn is well up; spring wheat is thickening, and spiring upwards rapidly. There are good settings of fruit on apple, plum and cherry trees. In short, everything but prices is looking well for the farmer. Only the best butter can be sold for 12c. to 13c.; the common sorts are slow at 8c. If this is not hard-pan, where shall we find it? On the night of June 7 there was a severe frost, cutting down about all the corn, bean vines and potatoes that were up. Fortunately the season is so late that but little of such crops is yet out of the ground. Those that were will have to be replanted. It did not hurt me much, being so close to the water.

T. H. H.

Massachusetts.

NORTH RAYNHAM, Bristol Co.—The season in this part of the State has been cold and backward. Excepting during the last few days in May — which were very hot—there was but very little rain in that month, and grass had begun to suffer. There will hardly be an average crop even with the best of weather during the rest of this month. A good deal was killed by the white worm last summer. Potatoes are looking well where not killed by the frost, which was not very severe right here. This is the fourth year of the Colorado beetles, and, according to my experience, they have doubled every year. Corn is backward and looks rather yellow. Little or no wheat is raised in this locality. Rye is not looking very well, so far as I have observed. This is the "off year" for apples, and, as trees blossomed very little, there cannot be much fruit. Pears and peaches have set well and promise a good crop, although they are not much cultivated. In regard to grapes, I have made no inquiries, but, judging from my own, I think there will be a fair crop. A good many strawberries are raised in this section, but I cannot say whether a good yield is expected or not generally. One of my neighbors, quite an extensive grower, thinks his crop will be light. Pastures are not as good as usual. The principal money crops in this section are poultry, milk, strawberries, potatoes and cabbage.

T. G. L.

AMHERST, Hampshire Co.—Wheat is not much grown here. Corn-planting is just over and fully as much has been planted as last year. The acreage of potatoes is larger than last year. The elegantly striped gents from Colorado came promptly to time, as numerous as ever, and the prospect for a large crop (of the aforesaid gents) is unusually fine. The acreage of tobacco will be larger than last year, and the Havana variety is gaining in favor and will take the place of seed-leaf to a considerable extent in some places. The prospect for a large hay crop is good. The bloom of apples was unusually good for the "odd year," and the fruit has set well, but is badly punctured by the curculios, which are very abundant this year. The prospect for a large crop of pears is uncommonly good, the bloom being very heavy; standard trees set four years will bear for the first time this year. Peaches, the buds of which were reported (from an examination of a few garden trees) as about half-killed by the winter, prove not to have been materially injured generally, and the crop will be large for this region. Grapes give promise of a good crop. Strawberries are beginning to ripen, and the vines are loaded with green fruit. Plenty of rain during the last three weeks. L. W. G.

SHELBURNE FALLS, Franklin Co. — We do not raise wheat enough in this section to mention. Corn and potatoes are not far enough advanced to tell much about them yet. I think there is a good average amount of both started. Field potatoes are hardly out of the ground yet, but there are swarms of beetles waiting for them. Fruit trees blossomed well, particularly Pears and Cherries. Apples bid fair to be an average crop and there will be an extra crop of pears. Grass is also looking better than usual. Grapes blossom well. L. S. F.

MONUMENT, Barnstaple Co.—Wheat is not raised in this part of the State. Corn is well up and looks well. Early potatoes were injured by a late frost, but have started up and look nicely. This is not much of a fruit section with the exception of cranberries, and it is rather early in the season to form an opinion as to this year's crop. A. W. B.

Rhode Island.

PAWTUXET, Providence Co.—Wheat is not cultivated in Rhode Island; corn is to some extent, and looks well. Potatoes promise well now. It is the "off year" for apples, and there will be very few in New England. The prospect is very good, for a large crop of pears and strawberries. Blackberries and Raspberries were winter-killed badly, and the yield will be small. Peaches are not cultivated largely, but promise more than an average yield. H. G. G.

Connecticut.

HARTFORD, Hartford Co.—We live in a very rich and fertile valley where, in former years, tobacco was King, but of late years in consequence of the decline in price and inferior quality of the above crop, many of the rich acres formerly devoted to it are now cultivated in small fruits, garden products, potatoes, corn, and other grains. Grass has till within the last two weeks, looked very poorly; but the late extremely warm weather, together with timely rains, has had a most surprising effect, and the prospect is now good for an abundant hay crop. The high price of potatoes the past season, has led to the planting of an increased acreage this year. They are looking well and have received one hoeing already. The Colorado beetle is making us its annual visit, but the first crop of potato bugs at the present writing, June 10, is still unhatched. Corn, which is growing in favor and receiving considerable attention, is looking finely (my patch of Blunt's prolific included). Oats, rye, etc., are also looking well. Of strawberries there will be an abundant crop, the first of which was picked in this vicinity, June 7. Grapes, raspberries, currants and other small fruits are looking well or otherwise, according to the attention they have received. Pears and cherries promise to be plentiful, but of apples there is nothing to be said. E. A. G.

WOODMONT, New Haven Co. — Our season in this section is backward by reason of cold and wet weather, but the grass is looking well. Nearly double the usual amount of potatoes is planted, owing to the high prices they brought this spring. The potato bugs are plentiful. Corn planting is not finished yet. Wheat is looking fine, but there is not a large amount raised about here. Rye bids fair to be a good crop. Oats are backward, but if the season is favorable, they may come on and do well yet. Market gardening is carried on about here quite extensively, it being but six miles to New Haven. The milk business is quite an interest here, the farmers raising and peddling their own in and around New Haven. E. P.

BRIDGEPORT, Fairfield Co.—Crops are good in their present condition. Cherries and Pears are in bloom. There will be fair crops of both. Apples did not bloom full this year; many trees hardly made a show. Grass promises a glorious crop. The winter grains look well. Corn has as yet hardly got to a point where one can prophesy its yield. The potato beetle has, so far, been less troublesome than usual this year, though if of last year's sort, there is yet ample time for its appearance. N. B.

WEST CORNWALL, Litchfield Co.—The present condition and prospects of meadows and pastures are very good. Corn is fine; wheat and rye are medium; oats and barley, very good. Potatoes are coming up well. Local rains have injured the crops in some sections; but here we have had just enough. T. S. G.

SOUTHERN STATES.

Virginia

NEWMARKET, Shenandoah Co — We have had a severe drought here this spring; we have had hardly any rain since March. I have traveled over a large part of three counties around me and find the drought pretty general. The season is about a month later than usual. Prospects for wheat are poor; it will be below an average crop. Corn is looking well, but short yet. Oats will be short. Early potatoes are almost a failure. Cherries are in abundance, and there are fine prospects for a large crop of peaches, also for plenty of apples, grapes, etc. The prospects for fruit are far better than last year. We are troubled much with insects of all kinds on vegetables, plants, etc. The Colorado beetle's first brood appeared about the 25th of May. Bees are doing finely, having dry weather and plenty of fruit and clover blossoms. Prices are as follows: wheat, 97c. to $1; corn, 45c. to 50c.; butter, 12½c.; eggs, 8c. Farmers generally are in good cheer. H. N.

MORRISONVILLE, Loudoun Co.—The weather has been quite cool for the last three or four days, owing to a severe hail-storm which occurred on the 6th, destroying in its course wheat, corn, and garden products. Wheat in this part of the county will make an average crop. Corn is looking reasonably well. Our time of planting is from 25th of April to 10th of May. Potatoes are looking well now. The early crop will be fit for use by harvest, which will be about 25th inst. The fruit crop will make a good average so far as we can judge. We are having quite seasonable weather, in consequence of which our meadows and pasture fields are doing well. Clover fields are in full bloom, from which hay will be made about the 15th inst. "Hard times" is the cry of every one; money scarce and produce low. Wheat, $1.12; corn, $1; oats, 25c.; butter, 9c.; eggs, 8c. per doz. G. W. W.

FREDERICKSBURG, Spottsylvania Co.—Wheat on an average in this section cannot be more than three-quarters of a crop on account of the dry spring. The market price for it now is from a $1.12 to $1.20 per bushel. Corn is looking quite well. The market price is 46c. to 47c. per bushel. Oats will be nearly a failure, owing to the dry cool spring. Its price now is 33c. per bushel. There are no late potatoes planted here and the early ones are looking very well: price from 60c. to 75c., according to kind and quality. I think the prospect for fruit is unusually good. The hay crop will not be more than three-quarters of an average. We have some orchard-grass already cut and mostly in the barn. T. F. M.

LOVETTSVILLE, Loudoun Co. — The prospect for wheat is very good—better than last year. The corn is looking very well, but it is yet too early to tell how it will be. We are just planting the late, or the principal crop of potatoes, so that it is too early to prophesy their yield. The prospect for fruit is very flattering. As we had no fruit last year, the trees are very full. The weather is very favorable for vegetation. J. W. C.

West Virginia.

PARKERSBURG, Wood Co.—We had quite an extensive drought until after June, and wheat is short in straw, and has suffered very much;

but the prospects are now that it will fill well and make nearly an average crop. Corn is coming up badly and very unevenly, having been twice replanted. Potatoes are looking well and since the rain prospects are fine for a good crop. From present appearances we expect a good average crop of apples and other fruits. J. G.

MARTINSBURGH, Berkley Co. — The wheat crop throughout this section is very fine; we have now a good stand and large heads. Barring accidents, there will be a large crop. There is a large acreage planted to corn, and it stands very well and so far looks well. The season thus far has been fine. Oats will be a short crop. Potatoes are looking in good condition—an average acreage planted. D.

PADEN'S VALLEY, Wetzel Co.—Wheat is about two-thirds of a crop. Corn is backward—all replanted, and some thrice—and looks poorly. Early planted potatoes promise well, as do also later plantings—beetles not troublesome. No apples at all; but few cherries. There will be some pears, if drought does not dry them up. Excessively dry weather since about April 25. E. K. P.

Kentucky.

GLASGOW, Barren Co.—Indications are that tobacco will be a short crop in this county, say two-thirds of a crop. The oat crop is stunted by dronght; wheat will not be more than two-thirds of a crop, maybe less. Corn is a bad stand, much of it had to be replanted. Potatoes—early crop—short 25 per cent owing to dry weather. Very few peaches. Scarcely any cherries. Apples will be only two-thirds of a crop. E. Y. K.

HENDERSON, Henderson Co.—Wheat in this section will be a good, full average crop. Corn is looking well since the rains. Owing to dry weather immediately after planting, we have rather a bad stand. Potatoes are not cultivated to any extent here. The fruit crop will be a complete failure—there will be a few apples, but all the peaches can be carried in a bushel basket. T. W. W.

CARLISLE, Nicholas Co.—Our wheat in this county is splendid—fully 120 per cent within 20 days of harvest. The corn is backward, we have a good set, however, and it is growing rapidly and looks well. We never had a better show for a crop of potatoes. The fruit crop is about 50 per cent short. Peaches are a failure. Other sections of our country are not so encouraging. C. W. H.

DANVILLE, Boyle Co.—Wheat will be about an average crop—was somewhat shortened by drought in May. Corn is a bad stand and offers the worst prospect I have ever known at this season. The potato prospect is good. No fruit except apples, which will be about a quarter of a crop. W. L. C.

Tennessee.

STRAWBERRY PLAINS, Jefferson Co.—Wheat hereabouts is half a crop — perhaps two-thirds. Corn promises a full crop, though suffering for rain. Of potatoes, Irish, half a crop; sweet, half a crop. Spring and winter oats are a failure. We have had an unusual drought for the last four weeks and are still wanting rain. J. M. M.

North Carolina.

LOWELL, Gaston Co.—Harvesting has begun in this neighborhood, some wheat having been cut five days ago, and ere this is in print the grain will all have been gathered and much of it thrashed, for with us thrashing follows quickly on the harvest. Corn is looking very well, and much is being laid by. Vegetables and gardening generally are in fine trim, and yield well, for our weather has been excellent for crops. For about a week we have had no rain, except one light shower, but the lightning in the north this evening and the heavy banks of dark clouds gathering foretell a good rain. Nothing, however, needs rain, cotton being now the crop to be considered, and it is a plant that requires heat. Our cool nights, with heavy dews for the past week, have hindered the growth of cotton, but the grass and weeds are out, the fields are clean and there is a good stand, and every indication points to a good crop. Our farmers are raising their own bread and meat and other table supplies. They are plowing their lands deeper this year than before, and an era of material prosperity is in sight, with plenty to live on and the cotton for a money crop. Our farmers who are out of debt are laying up money, and others are paying off their mortgages contracted during the period when they only raised cotton and bought their supplies. The cotton mills here are working over-time. There is never a failure in the supply of water. The health of Lowell and vicinity is very good, the highest temperature thus far having been 88° Fah. in the shade, with always a gentle breeze. C.

GREENSBORO, Guilford Co.—The wheat harvest is now commencing in this section. Wheat was thinned by the severe winter, but it has come on wonderfully, and farmers think it will be a full average crop—far ahead of last year's. Corn prospects are good, but the crop has not advanced far enough to tell much about it yet. The prospects for Irish potatoes were never better; farmers are now eating full-grown ones. We are never troubled here with the Colorado beetle. The peach crop is poor—killed out by frost on all low places. In some sections, however, there will be about one-third of a crop. The apple crop is good. A fair crop of cherries and pears—the former now ripe and gone. Winter oats are almost an entire failure, having been killed out by the frosts of winter. Spring oats look promising. J. VAN L.

ASHEVILLE, Buncombe Co.—The wheat crop in this section presents an unfavorable appearance. The severe winter froze out a great deal, and that which remains is low and unpromising. The corn crop, up to this time, is good. Tobacco plants are plentiful, but the planting has been retarded by the dry weather. It is of great importance to get the crop set out by the 10th of June. If planted later than this, the cutting comes too late; and although it may escape frost, the cold winds of October render it almost impossible to cure it a bright golden color. With the growers of fancy gold leaf the color is all, for without color it is held to be a failure. I fear that the crop cannot be as good as last year's. S. C. S.

CHAPEL HILL, Orange Co. — Wheat was thinned by the severe winter, but has had a favorable spring, and will probably be a much better yield than last year. Corn is a good stand and a good start. Frequent rains have caused much grass. Potatoes are doing remarkably well. Fruits will be perhaps from 20 to 50 per cent. of a full yield, the average being from 25 to 35 per cent. Oats, a very light harvest. Cotton starting well, but with less acreage. A. W. M.

South Carolina.

GLENDALE, Spartanburg Co. — So far, up to the present time, the corn and wheat look well in this section of country, and the prospects of good crops are favorable. Potatoes are doing well—I think better than for several years. The prospects for fruit are not very promising on account of late severe frost in spring. J. H.

Alabama.

BIRMINGHAM, Jefferson Co. — The wheat harvest is now about over, and though the stand was injured somewhat by the cold winter, it promises a full average crop. Winter oats were thrown up by the cold, and will not be over one-third of a crop: spring oats are about 90 per cent of an average crop. Clover and pasture are good. The corn prospect is above average. Cotton, too, is above an average. Potatoes are an average crop. Peaches are all killed in the valleys, but we have large quantities of land, "above the frost line," well adapted to fruit culture, on which there is 75 per cent of an average crop. Apples are a quarter of a crop in the valleys and a full crop on high lands. Grapes are a full crop. Gardens are fine. W. J. E.

ANNISTON, Calhoun Co. — The weather has been dry here for months. We have had no rain at all in 24 days. Crops are backward, with the exception of cotton, of which a larger area is planted than ever before. Wheat is very poor. Oats are medium. Corn is small, owing to drought, but if the weather be seasonable it will yet make a full crop for area planted, which is less than usual. Prices are: oats, 55c.; corn, 80c.; wheat, $1.25. All fruits are total failures except apples, of which we may get half a crop. Everybody has plenty to eat, and we have no tramps. C. A. S.

HUNTSVILLE, Madison Co. — We are now harvesting the largest wheat crop that has been raised in this county. The oat crop promises to be very fine. The vegetable gardens have suffered somewhat from lack of rain; but are doing very well. The late freeze in March killed most of our fruit. I have one-third of an acre in tomatoes, that I think will produce 200 or 250 bushels. I picked the first ripe tomato June 2. Corn and cotton are doing very well. Cotton is somewhat later than usual. P. H. M.

Georgia.

SHELTONVILLE, Forsyth Co.—Wheat is being harvested, and the prospects are good for a heavier crop than we have had in this section for years. Corn is growing finely and looks well. Farmers are about up with their work. Our fruit crop will be very short, owing to the frost in April; some orchards are full, while others have none at all. Potatoes are not raised in this section except for family use, though the prospect for a good crop is fine. Other crops are all looking very well. E. P. R.

GRIFFIN, Spaulding Co.—In this section wheat is as fine a crop as we have ever had. Up to the present, corn is promising well. Cotton holds out flattering hopes of a fine crop. Potatoes are only medium. Fruit is almost a failure in this section. Oats are not more than half a crop. Farmers in general are in high hopes as to our main money crop—cotton—both as regards the yield and the chances of high prices in the fall. We have a very large area under it. T. C.

WASHINGTON, Wilkes Co.—It is three weeks to-day since we had rain in this section. The wheat and oat crops are good. Harvesting is about finished. Corn needs rain. Cotton is doing well. The potato crop is backward. I planted the Blunt corn, April 10th, it came up well, and is now nearly six feet high. Planted it on rows I had prepared for cotton. Fruit prospect, poor. J. C. D.

MARIETTA, Cobb Co.—Wheat will likely be above an average crop. Corn looks well, but needs rain—can say nothing definite with regard to it yet. Potatoes are below the average, as we have had a dry spring. I think the fruit crop will be below half a crop of inferior fruit; late frost has hurt it. Cotton, a fair average. J. I. C.

Texas.

WILL'S POINT, Van Zandt Co. — This town, of about 1,200 inhabitants, is beautifully located, and in the middle of a rich and fertile prairie. The country surrounding is composed of prairie and timber pretty equally distributed, and, from the fertility of soil and healthfulness of location, is most admirably adapted to persons from the North who desire to make for themselves cheap and comfortable homes. Improved land can be had at from five to eight dollars per acre, and unimproved, from one to four dollars, according to location and quality of soil. Land is much lower here than farther west, for immigration, as is often the case, to a great extent has passed beyond this, and to regions far inferior in every respect. Wheat, barley, oats, corn and cotton, as well as most kinds of grass, succeed admirably. Fruit of most kinds do well, but for the Grape I do not think any place in the world can excel it. Nearly all the stock sent from here to St. Louis and other markets were raised and fattened entirely on the prairies, without ever having been fed or housed. Hence, with Northern energy and care, what a chance is here offered to make a complete success, by combining farming and stock-raising together! In this mild as well as healful climate, very little feeding or attention would be necessary to rear stock and fatten it for market. The season is dry, and crops need rain badly. Wheat and corn will not make much, if any, over half a crop; but cotton promises finely. E. M.

BROOKSTON, Lamar Co.—Our spring was at first cold and dry, but on the last of April and first of May we had floods of rain. Since the 6th of May no rain has fallen. Corn is suffering. But little wheat is grown, and about all of it is harvested. The oat harvest too has begun—a short crop. The corn crop will be poor, as it is too far advanced for rain to save it. Early corn is tasseling. The Irish potato crop was light. Cotton looks well where it was worked out early. Prices of produce are: wheat and oats, none in market; corn, 35c.; potatoes, 75c. to $1 per bushel; butter, 10c. to 12½c.; eggs, 7c. to 8c. per doz.; green peaches, 50 cents per bushel; apples, do. The fruit crop is good. W. J. N.

HOUSTON, Harris Co.—We are too near the coast for wheat. Cotton and sugar are our staple crops. The latter is doing very well. Cotton looks poorly, and we have news of worms making their appearance in several localities. Corn is suffering from want of rain. New sweet potatoes are now in market, but the crop will be short unless rain is given very soon. Peaches and figs are small crops, having been cut short by the dry weather now prevailing. J. F. D.

LULING, Caldwell Co.—The corn crop is not as good as usual in this county. Wheat is a total failure. Oats are nearly as bad. Our only hopes are now in cotton, which is often badly in the grass and "burrs." The "oldest inhabitant" never witnessed such an unfavorable season for farmers. I. J. E.

[For the very latest reports see page 400.]

The Querist.

ANSWERS TO CORRESPONDENTS.

Treatment of Tree Roses.

Mrs. R. B. H., Baldwinsville, N. Y., has procured some Tree Roses, and wishes some suggestions that may assist her in cultivating them.

ANS.—Owing to our hot summer and the extreme cold of the winter months, rose culture does not succeed as well here as it does in Europe. Shelter the plants from the strong winds, and tie each securely to a stake; it is also well, not to expose them to the full blaze of the hot noon-day sun. If they should suffer from mildew; give them a dusting of flowers of sulphur early in the morning before the dew leaves the plants; if there is no dew, sprinkle them, first, with water. To protect them against the ravages of their many insect enemies, syringe them with a weak solution of whale-oil soap or other insect-destroyer. Though many Remontant Roses are hardy, it is not safe to leave Tree Roses unprotected in winter. A method of wintering which we have successfully employed, is to loosen the Rose from the stake and bend the head to the ground, while an assistant, to avoid breaking the stock, thrusts a pitchfork under the roots on the opposite side and gently raises that side of the plant. Then make a slight hole in the ground in which lay the head and cover it with soil, taking care not to break any branches. As the severity of the weather increases, the plant should be covered with leaves or other litter. In the spring it is again raised to its proper position. Small plants may be potted in the fall and wintered in a greenhouse. Roses will bear severe pruning, and some pruning is necessary to give the head a well-rounded form. Vigorous shoots may be cut back one-half, or even two-thirds, of their length.

Calf Suffering from Indigestion.

U. T. S., Bear Canyon, Col. has a six-weeks-old heifer calf which he allows to suck half her dam's milk mornings and evenings. The other morning it would suck only half a dozen times, then draw back its head, and eject the milk fresh and uncurdled. This it did until it had milked the cow dry, and continued the practice for five days. The last evening of its ailment, it refused to suck, seemed to be in much pain, would lie down and stretch itself out at full length, then rise up and try to kick its sides, take a few steps backward and repeat the whole proceeding. On the third day he gave it a little melted lard. The calf at writing was quite well, and he asks what ailed it, and what was the proper treatment.

ANS.—The calf doubtless suffered from indigestion and consequent irritation of the stomach. Under these circumstances the milk frequently solidifies in the stomach and remains undigested, causing gastric derangement, and wholly stopping nutrition. The remedy is to give one ounce of carbonate of soda dissolved in water, and to pour this down the throat with care to avoid injury. A slender cow's-horn is a good thing to do this with. Pour the fluid down, a little at a time, and let the calf swallow it. An hour afterwards give one ounce of castor-oil and an injection of warm, soapy water. The injection may be be given by means of a bladder to which a tube of elder wood, having the pith removed, and smoothed on the outside, is fastened. Grease the tube before inserting it in the rectum, and inject about one pint.

Yellow Rust on Blackberries, etc.

W. M. K., Washington, D. C., 1. finds here and there in his blackberry patch a bush completely covered with something like red dust or powder; when the plant is shaken, the dust flies around, and he asks the cause of it and a remedy for it. 2. He has had some seed sent him like peach seed, but much smaller, and he sends us a heresay description of the plant and fruit, and asks us to name the tree.

ANS.—1. The trouble is a fungus commonly known as "yellow rust." It frequently prevails on our wild Black-cap Raspberries and on Blackberries, both upright and trailing, and often attacks the cultivated kinds, as in this instance. Its effect is to change the whole character and growth of the plant, making it slender and feeble in growth, as well as unfruitful. It would seem as though some varieties are more susceptible to its attacks than others. A notable instance is that of Mr. Ohmer, of Ohio, who had a famous and profitable plantation of 10 acres of Kittatinny Blackberries entirely destroyed by this fungus and this fate awaits our correspondent's, unless arrested. The flying dust mentioned shows the fungus to be ripe and ready to propagate itself in this way. The only *absolutely safe remedy known* is to dig out and burn every plant, *root and branch*, as soon as the disease is manifest. 2. From the description given, we should *guess* the young trees are Nectarines.

Yellow Rust on Blackberries Again.

N. C., Berlin, Conn, says "After the snow disappeared, last spring, I noticed that some of my raspberry bushes appeared much injured, the bark on many of them being loose near the surface of the ground. I cut them back pretty well when trimming, and the leaves started finely, but the plants did not bud, nor did the leaves on the affected vines attain the size of those on the others. They soon began to look sickly, and the under sides of the leaves became thickly covered with yellow spots. A few days ago, I rooted them all out lest they should affect the sound plants." And he asks whether the severe winter was the cause of the ailment, or if the sickly appearance, as if they had been winter-killed, was due to some disease, and whether the unsound plants would affect the others injuriously.

ANS.—The trouble here is evidently the "yellow rust," alluded to in the foregoing answer. We presume the plants were Black-caps, as we do not remember having ever

seen it on any other kind. It is hardly probable the severity of the winter had anything to do with the *cause*, whatever may have been its effects, if any. How the fungus propagates itself—whether through the ground and sap-vessels, or by the spores flying about and becoming attached to the plant above ground and thence growing and spreading—is, as far as we know, undecided; but, like many diseases, the human family is heir to, it is infectious, and the only safety, as stated elsewhere, lies in cremation.

Training a Colt.

W. N. C., Glendale, Pa., asks the best way to train a colt and how early should the training begin.

ANS.—When a week old, a colt may be halter-broken and taught to stand tied up by its dam. It may be trained to stop at the word "whoa!" and to back up. When two years old, if compactly made, it may be put in the harness and driven slowly before a light vehicle; but, if large and loosely formed, it should not be driven at all before it is three or four years of age, or the joints may be injured. Every colt should be thoroughly subdued and accustomed to the harness on its body and about its legs before being attached to anything. If this part of the training is thoroughly done, the animal will rarely become frightened if any accident happens. A stubborn and unmanageable colt may be made tractable in a few minutes by tying the halter to its tail, and whirling it around in a circle. This is better than the Rarey system of throwing the animal, as there is no dranger of straining. A colt should be taught but one thing at a time.

Mode of Planting Blunt's Corn for Rural Premiums.

A. C. W., Hugo, Ill., says that it is a well-known fact that in Illinois more corn to the acre can be raised in a large field than in a small plot. Now, suppose a person has enough of Blunt's corn to plant, say, 10 acres, and right in the middle of the field he stakes off one-fortieth of an acre, and there plants the seed sent by the RURAL, or plants it just adjoining his large field; he asks whether such a mode of planting would accord with the terms according to which those who compete for the RURAL premiums, must plant their plots.

ANS.—The question here raised is a good one. It would not be fair to cut out a fortieth of an acre from a large plot of corn. The corn which we have sent to our subscribers (it matters not how many kernels each parcel contains, so long as we are informed of the number planted), must be planted within the area of one-fortieth of an acre, and it must not be connected with any other plot. A considerable distance should separate them—say, 100 yards. But, for obvious reasons, we cannot prescribe the exact limit. We insist, however, that the one-fortieth of an acre should not be a part of any other plot.

Mortality Among Bees.

J. D. T., Brookside, N. J., writes us that very many bees have died in that section this spring and summer. No apparent cause can be found, as they have an abundance of honey and there are no signs of disease. One man lost sixteen colonies out of 48; others have lost more or less, and some all. On an average, the loss is about two-thirds of the whole stock. He asks if we can assign the cause and give a preventive.

ANS.—We are unable to give either cause or preventive in this case. If the bees are breeding, are gathering honey, and are apparently healthy in every way, it seems rather mysterions that so many colonies should die. Of conrse, there is a cause, which we doubt not may be found on close observation. It may be possible that it is some new bee-malady hitherto unknown. The human family suffers from epidemic diseases, as do horses, cattle and all other domestic animals. It does not seem impossible that bees, too, might be similarly affected. At any rate, it is worth investigating, and we shall be glad to receive further data on the subject.

Treatment of Night Soil.

J. B., Union, N. Y., asks the best way to treat a lot of night soil—whether to compost it with other manure or to mix it with coal ashes or muck of which he has four acres—or to add lime and salt to it.

ANS.—Night soil can best be composted with earth. To handle it conveniently, prepare a bed of earth or sifted coal ashes a few inches deep, and raise a bank around it of the same material sufficiently high to prevent the soft, semi-liquid matter from flowing over. When the cesspool is emptied or the bed is filled, turn in the earth and mix it with the night soil so as to have it thoroughly intermingled and nearly dry. It would be well to scatter a few bushels of plaster over the compost as it is mixed The heap should stand a few days, when it will become dry, almost odorless and can be handled without inconvenience. It should be used at once, as the oxidation of the night soil goes on very rapidly as soon as it is mixed with the earth, and the value rapidly depreciates. Muck, if dry and fine, will make an excellent absorbent.

Lantanas.

K. D. A., Clinton, Mich., asks how soon Lantanas will bloom from seed. She has some fine young plants raised from seed this spring, and now the questions arise whether they will bloom this summer and how they should be treated.

ANS.—It is best not to expect any flowers till next summer, then you will not be disappointed. Plant them in a bed in the garden this summer, and train them to well-formed, symmetrical plants by tying them up and pinching the most lawless shoots. In September they should be lifted, both roots and branches cut back, and potted for wintering in the greenhouse. Some varieties of Lantana are very vigorous growers; these can be trained in tree form, if desired. Cut off all side branches from the most vigorous shoot and train it perpendicularly to a hight of from three to six feet, then pinch off the tip and let it form a symmetrical head.

Honeysuckles for Hedges.

J. E. L., San Antonio, Texas, referring to an article in the RURAL, which spoke of Honeysuckles suitable for hedges, asks what kind of Honeysuckle would answer the purpose, and when should it be planted.

ANS.—Almost any of the *standard* Honeysuckles is suitable for this purpose, if cut back from year to year. There is a long list in most nurserymen's catalogues. The Tartarian would, perhaps, answer as well as any. It is easily propagated by cuttings, layers or seed, in spring.

Removing Suckers from Corn.

M. D., Coffeyville, Kansas, says his Blunt's corn is sending out suckers, and asks whether he shall cut them off.

ANS.—Whether there is anything gained by removing suckers is a disputed question. Recent experiments go to show that there is no advantage in removing them. The pistils (silk) of corn do not mature simultaneously. Some think that the pollen from the suckers may be serviceable to those maturing plant, which would not otherwise be pollenated. We do not intend to remove the suckers from our plot of Blunt's corn.

Miscellaneous.

A. M. Okolona, Miss., complains that his melon vines have for several years been badly eaten by insects, and asks for a remedy.

ANS.—To apply poisons to melon vines or other vegetable bearing fruit, is too dangerous. Insects may be kept in check, though they are not killed, by a liberal application of a mixture of wood ashes and plaster, scattered over the leaves and around the stems of the plants, If one has but a small plot, it will pay to look all the plants over while young, and destroy all eggs that may be found.

O. A. S., Macon City Mo., has on his lawn several mulberry trees all of which bear fruit except one. The exception is different in appearance from the others, and has a splendid show of fruit in spring, but they all drop off later on. He has dug around it and fertilized it and it is growing vigorously, and he asks for a remedy for the dropping off of the fruit.

ANS.—As the tree is vigorous, we can only suggest root-pruning.

M. W. H. address not given, wishes to know how to destroy the lice on his grape vines; they work on the tips of the young shoots and also on the leaves.

ANS.—Dip the ends of the young branches in a pail of tobacco water, and gently syringe the leaves with the same. A weak solution of whale-oil soap will also accomplish the same end.

P. O., Morristown, N. J., asks who has Lop-eared rabbits for sale and whether the Himalaya or Angora rabbits are dearer than the Lops.

ANS.—A. M. Halsted, Rye, Westchester Co., N. Y. has Lop-eared rabbits for sale. Neither the Himalaya nor Angora babbits are dearer than the Lops. These are the rarest and highest-priced.

W. H., Pitcher, N. Y., asks whether liquid manure direct from the cow stable is a good application for Strawberries.

ANS.—Yes, especially when the fruit is set and swelling; but it must be diluted with, say, thrice the quantity of water before applying it, otherwise it will "burn" the plants.

Miscellaneous.

NOTES FROM THE RURAL GROUNDS.

Strawberries.

SHARPLESS.—A dozen plants were sent to us from Messrs. Ellwanger and Barry's. This new variety has been much talked of and extensively advertised. Of all our varieties this, during the past winter and spring up to the present time, has been the most vigorous. The leaves are very large and held up by long petioles. But the peduncles, instead of growing erect until pulled down by the weight of the fruit, often shoot out the same as runners. If this habit be not exceptional, it will make an objection to this variety, since the berries grow and ripen flat upon the ground or mulch. The peculiar shape of this berry is remarkably constant and although as we make these notes (June 8) there is not a ripe berry on the vines, it would be easy among twenty varieties to pick out every Sharpless.

CRESCENT SEEDLING.—(E. P. Roe). Our plants of this variety are so full of berries that it seems impossible that all should ripen. We have just counted 155 upon one medium-sized plant, each raceme bearing from 30@40. None ripe at this date.

FOREST ROSE.—(E. P. ROE) is by no means so prolific. The pedicels are long and few. None ripe.

FROM THE OCEAN CO. AGRICLTURAL SOCIETY of Ohio we received a dozen plants of a variety not yet named. They are strong growers, bearing large leaves and rather short petioles. The berry is much like that of Beauty or Borden 30, except that it ripens evenly and is of excellent quality.

GOLDEN DEFIANCE improves with acquaintance. It is both vigorous and prolific. The berries are of what might be called the perfect strawberry shape, and they are held up finely by strong stalks, so that mulching is scarcely necessary.

THE STRAWBERRY needs moisture, and a rich and well drained soil. We have supplied the draining and the richness, and the season has supplied all the moisture needed. The result is a promise of an immense quantity of the largest berries we have ever raised.

As the season advances and the new varieties develop their merits or demerits, we shall endeavor to furnish those of our readers who intend to form new plantations, with such notes as may guide them in a judicious selection. We are well satisfied that among the many new kinds we are testing there are several which will escape the verdict which trustworthy tests, as a rule, impose upon new plants of all sorts.

Raspberries.

We may now record that of all our Raspberries, Cuthbert, Montclair, Erwood's Everbearing, and Highland Hardy have stood the past winter best; Delaware and Brandywine, next. Brinckle's Orange was killed to the ground, though protected. Florence (yellow), unprotected, was less injured.

THE THWACK, sent to us to be tested by the Messrs. Hance & Son of Red Bank N. J., our readers may remember we regarded as a highly promising market sort, should it prove to be hardy. The berries are large and firm and, though of poor flavor the bushes are thrifty and fairly prolific. We have given it a fair test during three seasons. It seemed unusually hardy during the first and second—but every one of our six plants has been killed nearly to the ground by the past winter.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

QUESTION.

"Is there a simple chemical test for the detection of coal-ashes in wood-ashes? With the present low price of coal it is quite risky to buy leached ashes."

ANSWER.

Wood-ashes can be tested for coal-ashes most simply by putting a few handfuls in a pan, wetting the whole thoroughly and stirring it under a gentle stream of water. The fine ashes will float away in the overflowing water, leaving, in case of pure wood ashes, merely some charcoal and sand which are always present in wood-ashes. If coal-ashes are intermixed, bits of half-burned coal and lumps of slag or clinker will also remain, which can easily be identified, and from their quantity some idea of the extent of the adulteration can be formed. Suspected samples may be sent to the Station for further examination.

S. W. JOHNSON, Director.

CATALOGUES, &c., RECEIVED.

PACIFIC RURAL HANDBOOK, by Chas. H. Shinn; published by Dewey & Co., San Francisco. Price, one dollar. Mr. Shinn was formerly a contributor to the RURAL NEW-YORKER, for which he still writes occasionally. He is now the able editor of the California Horticulturist, and Horticulture and Gardening, the subject of the little work before us, could not have been treated of by a more competent authority. The book comprises 122 pages, and contains a series of brief, practical essays and notes on the culture of trees, vegetables and flowers adapted to the Pacific Coast; also, hints on home and farm improvement. The book manifests throughout the author's ardent love for the Beautiful in nature, and is well calculated to inflame and stimulate the same sentiment in its readers.

PLANT CATALOGUE from R. S. Victoria and Paradise Nurseries, Upper Halloway, London, England. This is a pamphlet of 128 pages, containing several fine wood cuts and a comprehensive list of Orchids, Ferns, Palms and general stove and greenhouse plants, and of new plants for 1879. Mr. Williams is a well-known author of several works on greenhouse plants and their culture. He makes a specialty of choice stove plants, and brings every year numerous new and valuable plants to the notice of the public. The catalogue contains particularly a large and choice list of Orchids, Ferns and Lycopodiums, a class of plants that is sadly neglected in this country.

CATALOGUE of Dutch Flower roots from Polman Mooy, at Haarlem, Holland. It contains a long list of choice Hyacinths, Tulips, Narcissuses, Anemones, Ranunculuses, Crocuses, Amaryllis, Gladioli and many other select bulbs. The firm solicits its patrons to send in their orders at an early date in order to give each the promptest attention.

PETER HENDERSON & Co. send us their special list of Vegetable Plants and Seeds. The leading varieties of celery, cabbage and cauliflower plants are described, and seeds for present and fall sowing are enumerated.

CATALOGUE of the University of N. C. 1878-9.

A CORRECTION.

IN "Our Bee Hints" of June 7, page 360, it reads, "Under normal conditions an egg in a queen cell will hatch in three days; in five days more the cell will be capped, and in about 16 days later her majesty will come forth fully developed, making altogether about 24 days." It should read, "and in about 16 days her majesty will come forth fully developed, which is five and eight days earlier than workers and drones respectively, the former emerging in about 21 days, and for the latter three days more, making altogether about 24 days." —[EDS.

SHEEP POISONED BY EATING LAUREL.—We occasionally see a query asking for a remedy for the cure of sheep, that have been poisoned by eating Laurel. I will give the readers of the RURAL a very simple remedy that cured several of my sheep, two years ago, after they had become so bad from the effects of the poison, that they could not get up. I made a strong tea from corn cobs and gave it to them. Their recovery commenced at once, and was very rapid. I believe it to be a sure cure for the above poison, and hope that any who are so unfortunate as to have sheep thus troubled, will give this remedy a trial. D.

OUR CROP REPORTS.

To be able to estimate in advance with a fair degree of accuracy the probable yield of various crops throughout the country, is of no small interest to the agricultural community, not merely as a matter of curiosity, out also because such foreknowledge, wisely utilized, will enable the farmers to sell their produce to greater advantage and conduct their affairs on better business principles. Nor are the farmers the only people interested in this question; for there is no class in this country, nor, indeed, in the civilized world, to whom the American harvest is not a matter of great importance. To the railroad and shipping interests, and the whole carrying trade, an abundant harvest means a prosperous season and large dividends; to the mercantile community it means an extensive business on a sound basis; to the manufacturers it means large sales and small losses; to the laboring classes it means plenty of work and paying wages, and plenty of food at low prices, while to the nation at large it is a sure guarantee of comfort and prosperity.

Nor are the blessings of abundant food and low prices consequent upon a fine harvest here, confined to this side of the Atlantic, for abroad also the toiling multitudes are benefited by the surplus products such a harvest enables us to send them. True it is that overflowing crops here cheapen the price of farm products and consequently lessen the profits of farmers elsewhere; but the agricultural community of Europe, and especially of our chief market, England, forms but a comparatively small proportion of the whole population, and there is no single general benefit that does not entail a thousand individual hardships.

Reliable information with regard to the prospects of all crops can be obtained only from those who cultivate them, and who are acquainted with the customary yield in each section and under each method of treatment. In this issue several hundred farmers from as many points scattered all over our broad territory, give well considered opinions on the outlook for crops in their respective neighborhoods or counties. With a very few exceptions, all the writers are practical farmers, each well acquainted with the condition of the crops in his own vicinity. Many of them are the secretaries of the agricultural societies of their respective counties, and these have condensed in their reports to us the results of their investigations and of the local reports made to them. Taken as a whole, therefore, an excellent estimate of the coming harvest throughout the country can be readily formed by a careful perusal of these pithy and interesting accounts.

From these and various other sources of information, including the report of the Department of Agriculture, received this morning from Washington, it appears that the average condition of winter wheat is 90, against 98 last year. The yield on the Pacific coast, from which our special reports have not yet reached us, is considerably above the average, Oregon rising to 104. The States north of the Ohio river average 95, Indiana reaching 103. The crop in the Middle States averages 86; that of New England 94; and of the South Atlantic States 96, South Carolina reporting 108 and Georgia 112—a fine showing for the Empire State of the South. The Southern inland States average 88, the Gulf States 83, and the trans-Mississippi States only 79, as compared with 98 last year. All over the country a late spring and severe drought have been more or less injurious to the crop. Complaints of winter-killing have come from some parts of the South, and of slight ravages by the Hessian fly from the North and West; while grasshoppers have made their appearance, but have not yet done much damage, beyond the Mississippi. The acreage under spring wheat is about four per cent greater than last year. The heaviest increase is in California, which reports ten per cent more; while in the New England and the States west of the Mississippi there is an increase of five per cent., and one of nine per cent. in Minnesota; while the Middle States fall off one per cent. The condition of spring wheat is about the same on the whole, as that of winter wheat all the States being a trifle below the average, the crop having been subjected to the same injurious influences. There is a considerable increase in the acreage under wheat, but the amount of this it is at present impossible to ascertain. In many of the old States the increase is, in the aggregate, not inconsiderable, while in some of the border States, and especially in the Territories, it is of great extent. For instance, in one county in Dakota, which last year sowed only fifty acres, upwards of four thousand acres have been grown this year. It is more than probable, therefore, that this great increase of area under wheat will at least fully counterbalance the slight diminution in the yield per acre of the crop.

Corn is nearly everywhere backward, but the late rains all over the country have already pushed it ahead wonderfully, and unless the weather is very unfavorable a fair crop is among the probabilities. Curiously enough, while our Kansas reports indicate a very poor wheat crop, they all promise a splendid crop of corn. Poor seeds and planting too early appear to be the causes of the present unsatisfactory condition of the crop in the Middle and most of the Western States, and it is to be hoped that the lessons taught by the hard experience of the present season will not be profitless in the future.

The prospects are promising that cotton will be an excellent crop this year. The area planted to it is reported to be at least two per cent larger than last year, while the stand and culture are both fine. Taking 100 as the average of last year's crop, 47 counties in North Carolina report their present crop at 103; 18 counties in South Carolina report 100; 71 counties in Georgia, 102; 12 counties in Florida, 98; 58 counties in Texas, 107; 40 counties in Arkansas, 101; 18 counties in Tennessee, 103. The average yield per acre, however, will be a trifle less than last year, in the proportion of 96 to 99. Like corn, it is in every section about a couple of weeks backward. At present the prospect seems to be that oats, rye and barley will be somewhat less than average in yields; but while the acreage under each is about the same as last year in the old-settled States, there is in the Western States a considerable increase, which will, not improbably, help to bring the aggregate crops out fully abreast of those of last year. The high price of potatoes during the past season has led to the planting of a greatly increased acreage to this crop, and as the yield, on the whole, promises to be abundant, low prices will most likely be more universal next season than good figures have been this. Then it will be at least possible that the low prices realized for potatoes the coming season, may again restrict farmers in planting them on the following year, when another era of high prices will be pretty sure once more to produce so large a supply as again to overstock the market.

Apples will be a short crop, and those who are fortunate enough to have exceptionally good yields, are pretty sure to realize good prices. While reports from the Maryland and Delaware peach regions are highly promising, the peach crop throughout the country will, in the aggregate, be considerably smaller than the apple crop. Of small fruits there will probably be the usual supply, so that there cannot be much difference in prices from those that have ruled during the past season.

On the whole, the prospects for the farming world while not particularly brilliant, are certainly encouraging, and we are glad to notice that from every quarter come words of hope, contentment and good cheer.

FAULTY BREEDING.

We *can* have too much of a good thing. In its way a finely-bred steer, or a sheep or hog is a good thing, and, so far as it becomes profitable to the producer and useful to the consumer, the world is better for it. But when by a course of breeding for several years the end has been reached in these respects, it is time to stop. If the so-called improvement results in the conversion of a fine carcass of flesh into a mass of tallow or lard, and gives the hapless consumer a few bones drowned in a dish of fat for his meal, instead of succulent, tender flesh, he considers himself to be an ill-used man. Formerly the pride of the butcher and the joy of the housekeeper was a cut of Devon beef beautifully marbled with fat and lean intermingled; and the Berkshire ham and bacon, or the Essex market pork, were the *ne plus ultra* of the breakfast table. Then it was the end which ennobled the means to it, and a breeder pointed with pride to the dressed carcass of his well-bred animal.

Unfortunately we have changed all that. Now the talk of the breeder is of the mellow hide and handling of his beeves, significative of a soft layer of fat beneath the skin; or of the short face, turned-up snout, breadth of loin, or enormous weight of his pig, all which mean a mass of fat in place of a well distributed mixture of it with useful lean. And the mischief grows. The beef of a show Short-horn would be rejected from the kitchen of any housekeeper, and already the effect of the crossing of such animals upon our common stock is to be seen in the waste of fat which is thrown off from the butchers' stalls. The yield of lard per 100 pounds of live weight is gradually increasing, and this tendency is not to the greater usefulness of the pig, but otherwise. The result is charged to the influences of the methods of judging stock and the fancy points of professional breeders. But it is time that the other end of the line should be heard from, and those whose money pays for it should give the breeders a piece of their mind.

A NEW PRODUCT FROM BEETS.

The wonders of nature are amazing, and we have to thank chemistry for presenting to us the extraordinary disclosures made through constant experimenting in the laboratory. The common sugar beet, erewhile a mere food for cattle, was, within the memory of some persons yet living, discovered to contain a pure, crystallizable sugar. After many years' labor a successful process was invented to utilize this discovery, and now not far from one thousand million tons of beet sugar are made annually in Europe, with vast, indeed incalculable, profit to agriture. But sugar is not the only product of this homely root. A great quantity of molasses is produced from the refuse of the sugar manufacture; a large quantity of spirits is distilled from the refuse of the molasses; from the refuse of this last potash is made, and used as a fertilizer. Now a more wonderful discovery than all these has come to light. From the refuse of the distillation of alcohol there is now produced a combustible gas which can be condensed into a volatile liquid, known as chloride of methyl. This chloride of methyl has been used in the preparation of some of the brilliant aniline colors, but it has been now found to be a valuable refrigerating agent. By rapidly evaporating it, a temperature of more than sixty degrees below zero can be produced and maintained, and mercury can be reduced to solid metal by this means. But the grand value of the discovery will be in the use of this product of the modest beet root in the manufacture of ice. What vast possibilities may exist in a simple root! and what boundless wonders are enfolded in the commonest products of nature! Surely there can be no more ennobling study for the mind, or work for the hands of man than that which brings to his view the exquisite works of nature, or opens to his intelligence the fairy world, of which he may obtain a glimpse, at least, now and then.

PEARL MILLET—A MISTAKE CORRECTED.

The Maryland Farmer, in commenting upon an article in the Planter and Grange about Pearl Millet, says: "The RURAL NEW YORKER—high authority—will also be taken aback, if after all the expense it incurred in illustrating millets, and this variety especially, it is convinced by the Planter and Grange that it has been dressing up an old ewe in lamb-fashion?" Pearl Millet *is* new to the North, though old to the South, where it is better known by other names. We have never disguised this.

On page 540, August 24, is the following: "Our correspondent, Col. M. C. Weld, tested this plant twenty years ago, and disseminated the seeds for others to try. The reports were favorable; in view of which, as well as of the fact that it has been cultivated in some of the Southern States for many years, it is singular that it has escaped general cultivation, if worthy of it."

Had we space, and it were desirable so to do, we could quote at least a dozen passages to the same effect. Our only object in writing the above is to show our friend, the Maryland Farmer, that we have made no statement regarding Pearl Millet which it is not very easy to substantiate. Mr. Peter Henderson, against whom the article in the Planter and Grange was directed—very unjustly, as we think—estimated from his own tests a far greater yield per acre than we did from our tests. He, too, in an article published in November of last year, states distinctly enough that it has been cultivated "some years in some of the Southern States."

POULTRY EXHIBITIONS.

Miss Tox (one of the pleasing creatures of Charles Dickens's genius) was convinced that all the "crookedness" of disposition evinced by "Rob. the Grinder" was due to his association with pigeons. Was Miss Tox correct? It would seem corroborative of a suggestion that that lady's "head was level" to read in a recent issue of the New England Farmer that if "we were so disposed we could fill a whole page with accounts of tricks practiced to defraud," etc., in poultry exhibitions. This is timely, and pertinent to think of just now. The above-mentioned charge refers to the borrowing of birds to make up trios, and so carry off prizes to which the exhibitors were not entitled. There are tricks in all trades, and while there are many honest poultry fanciers, it is true there are some whom it will pay to watch very closely. But it is not pigeons or poultry alone that exert this demoralizing effect; witness the "stubble-shorn," yellow-ochered sheep; the sand-papered and waxed horns of the cows, their bandaged tails and skins washed with dung-water to confer a rich butter color; the false pedigrees, the stocked udders, and various other tricks and devices to catch the judge's favor. All these—to draw it mild—are not unknown to many breeders; and some medals and blue and red ribbons must recall to some folks reminiscences that will, or ought to, lie heavy upon their consciences one day in the future.

N. Y. HORTICULTURAL EXHIBITION.

The price of admission to the New York Horticultural Society held at Madison Square Garden has heretofore been fifty cents. The price at the last exhibition reported elsewhere, was but twenty-five cents. And yet the attendance was less than ever before, and financially, it was a failure. Many people value plants according to the price they have to pay for them. It seems to be the same with horticultural displays. They have now Gilmore at Coney Island. Perhaps he was a chief attraction.

With lager beer, cigar-smoking, and lounging about prohibited, we should like to know how a strictly horticultural show could be made to pay in New York City. Horticulture is everywhere exciting more interest from year to year, and we are constrianed to believe that if Horticultural exhibitions were properly conducted, there is no reason why they should not be well attended and well supported in this Metropolitan City.

BREVITIES.

Dr. Asa Gray and Professor Sargent have started for a month's tour in the mountains of the Carolinas.

Many excellent crop reports that have just arrived must be kept until next week, through lack of space for them in this issue.

We have never seen such a pest of rose-bugs as there are this season. They even destroy the flowers of late-blooming Magnolias and Clematis.

Among newer kinds of potatoes, Dr. Hexamer does not know of any variety more promising than Snowflake. It is especially adapted, however, to heavy soils.

Mr. J. T. Lovett, who has studied poultry as well as small fruits, tells us that he has settled upon the Brown Leghorns for eggs, and the Plymouth Rocks for all-purpose fowls.

"Probably," says Mr. Wilson in the London Chronicle, "all the wheats which have white grains have leaves of a lighter green than those which have red grains." If this is true, the shade of green is not always an indication of vigor.

Our reports are necessarily much condensed. When from any State there is a general coincidence in reports, we have combined several or more in one. Many of the reports had to be necessarily omitted, as they contained the name neither of the town, county nor State of the writer, and in some such cases the post office stamp was indecipherable.

We may still sow seeds of the following vegetables: squash, pumpkin, tomato, cucumber, nasturtium, musk and watermelon, sweet corn, bush, pole and Lima beans, okra, lettuce, turnip beets, ruta-bagas. Hoe up all blackberry and raspberry canes not needed for next season's fruiting. Set out celery plants. Potatoes may still be planted. If the beetles of the early potatoes have been killed, there will be few to interfere with the next crop. Study our crop reports.

Mr. Peter Henderson gives as the cream of all Strawberries, mentioned in order of merit, 1st, Pioneer; 2d, Forest Rose; 3d, Beauty; 4th, Sharpless; 5th, Monarch of the West; 6th, Borden 30; 7th, Jucunda; 8th, Charles Downing. He places Pioneer first because he deems it the earliest, while it is of as good quality and as large as Monarch. Dr. Hexamer, however, tells us that, like all of Durand's seedlings, it requires high cultivation. He also thinks that either Nicanor, Duchesse or Duncan is earlier. We have not tested Pioneer. Duncan is, with us, the earliest, though little else can be said in its favor.

HIGH FARMING AND LOW PRICES.

(Concluded from page 375, last number.)

To the wide-awake American farmer probably the most interesting and instructive part of Dr. Lawes's address was that relating to

Experiments in Fattening Cattle.

The growing importance of stock-raising in this country lends no small interest to everything connected with their economical feeding; while the absence hitherto among us of any systematic experimentation in this connection leaves us dependent on the results of foreign experiments for instruction on the subject. In the following table is shown what are the probable rate of increase to be expected from cattle of above average quality and liberally fed, and what is the average amount of food required to produce a given amount of increase.

In the table are given, the ages, weights and increase—first, of a number of prize cattle exhibited at Smithfield, in December 1878; secondly, of a number of prize cattle exhibited at the Chicago Society's Show (United States); thirdly, of some French cattle of the Nivernais-Charolais breed; lastly, at the foot of the Table is given, for comparison, the estimate of the average rate of increase during the fattening period, as adopted at Rothamsted many years ago.

AGES, WEIGHTS, AND INCREASE OF CATTLE.

"Before discussing the figures given in the table, it will be well to give some explanation of how they are obtained. The ages, and final weight per head, are the actual data recorded. The increase per day is obtained by dividing the final weight by the number of days of age. This is the mode of representation adopted in the United States; and the figures given in this column for the Chicago cattle, are those actually recorded, whilst those for the Smithfield and French cattle are calculated as above described. It is obvious that such a mode of reckoning, however valuable it may be in comparing the rates of increase of animals of the same description, oxen, for example, but of different breeds, or of different ages, is quite inapplicable in comparing the rates of increase of animals of different descriptions, and of different sizes; of oxen, sheep and pigs, with one another, for example. Many years ago, when considering this subject, we felt the necessity of adopting some mode of representation which enabled us to compare the amounts of food consumed, and the amounts of increase produced, not only among animals of the same, but of different descriptions, and of all sizes. Accordingly, the standards we adopted were:

"The amount of food consumed per 100 pounds live-weight per week. The amount of food to produce 100 pounds increase in live-weight. The increase per 100 pounds live-weight per week. But as, on the present occasion, I am dealing with cattle only, I give, as you will see in the last column of the table, the increase per 1,000 pounds live-weight per week. At the foot of this column is given the average increase per 1,000 pounds live-weight per week of all the cases recorded in the table, including the different breeds of the different countries; "babies" of two years and under, and mature animals of four years old and over. This general average of such very varied individual cases shows 11.9, or nearly 12 pounds increase per 1,000 pounds live-weight per week, whilst the Rothamsted estimate, adopted many years ago, is 10 to 11 pounds per 1,000 pounds live-weight per week, as the average rate of increase of oxen during the last few months of feeding on good, fattening food. To go a little more into detail, compared with this Rothamsted estimate of 10 to 11 pounds, the average of the different lots of the Smithfield prize cattle gives 11.5 pounds, that of all the Chicago cattle 12.7 pounds, and that of the four French cattle 12 pounds.

"In making these comparisons it must be borne in mind, however, that whilst in the case of the Smithfield, Chicago, and French cattle the increase is, for want of other data, calculated upon the average live-weight from birth to final weight, in that of the Rothamsted estimates it is taken upon the average weight of the final fattening period only; and as the rate of gross increase upon a given live-weight within a given time is considerably higher in the earlier than in the later periods of the life of the fattening animal, the figures are, so far, not strictly comparable.

On the other hand, a mature animal contains a larger proportion of salable carcass, and a less proportion of internal organs and offal generally, than a young or store one. The mature animal also contains a much higher percentage of dry or solid substance, and, accordingly, a lower percentage of water. These differences are clearly illustrated in the following table, which gives the proportion of carcass in 100 fasted live-weight, and also the percentages of dry or solid substance and of water, in 10 animals of different descriptions and in different conditions as to age and fatness, which were analysed at Rothamsted, now nearly 30 years ago.

COMPOSITION OF VARIOUS ANIMALS.

Description and Condition of Animal.	In Fasted Live-weight. Carcass.	Total Dry Subst'nce	Water.
	Per cent.	Per cent.	Per cent.
Fat Calf.....	62·0	33·9	63·0
Half-Fat Ox.....	64·7	40·3	51·5
Fat Ox.....	68·3	48·6	45·5
Fat Lamb.....	60·2	43·7	47·7
Store Sheep.....	53·3	36·7	57·3
Half-Fat Old Sheep..	53·6	40·6	50·3
Fat Sheep.....	57·5	50·7	43·3
Very Fat Sheep.....	63·1	59·6	35·2
Store Pig.....	66·4	39·7	55·0
Fat Pig.....	76·0	54·7	4.14

"Thus, you will see that even a fat calf contained a much higher percentage of water, and lower percentage of solid matter, than a half-fat ox; whilst the fat ox contained much more dry or solid matter than the half-fat one. Then, again, among the sheep there is a gradually increasing percentage of dry or solid matter, and decreasing percentage of water, from the store to the half-fat, from the half-fat to the fat, and from the fat to the very fat condition. A similar result is observed as between the store and the fat pig. From these facts you will see that, although the gross increase is less in proportion to the live-weight as the animal matures, a larger proportion of such gross increase consists of carcass and of real solid matter, and a less proportion of offal and of water. In fact, the fattening process may be said to consist in great measure in the displacement of water by fat.

Accepting the figures given in the table as giving a fair idea of the rate of increase of well-bred and well-fed animals, the question arises—

At What Cost of Food has the Increase been Obtained?

We have no records on this point in regard to any of the animals referred to in the table. We must, therefore, rely upon other data in arriving at a decision on this part of the subject. Our own estimate, founded on all the data at our command, partly relating to the recorded experience of others and partly to the results of direct experiments of our own, led us many years ago to conclude as follows: "Fattening oxen, liberally fed upon good food, composed of a moderate proportion of cake or grain, some hay or straw chaff, with roots or other succulent food, and well managed, will, on the average, consume 12 to 13 pounds of the dry substance of such mixed food, per 100 pounds live-weight, per week; and they should give one pound of increase for 12 to 13 pounds dry substance so consumed."

In other words, there will be consumed from 120 to 130 pounds of the dry substance of such mixed food per 1,000 pounds live-weight per week, producing on the average 10 pounds of increase; and 1,200 to 1,300 pounds will, therefore, be required to yield 100 pounds increase in live-weight. If the mixed food contain no straw-chaff, and only a moderate amount of hay-chaff, the average amount of dry substance consumed will be the less, and the average proportion of increase the more, or *vice versa*. Accordingly, we have assumed that on a liberal mixture of oil-cake, clover-chaff and swedes, as little as 1,100 pounds dry substance may be required to produce 100 pounds increase, and as much as 11 pounds increase may be produced per 1,000 pounds live-weight per week.

"The articles which you are accustomed to speak of as dry foods, still contain some water. Thus, cakes contain from one-eighth to one-ninth, and grain, hay, and straw, about one-sixth of their weight of water; whilst swedes do not contain more than 10 to 12, or mangolds more than 12 to 13 per cent. of really dry or solid matter; but the monster roots of which we hear so much, sometimes contain only about two-thirds as much dry matter as moderately-sized and well-matured roots should do. Of really dry substance, such as my estimates given above require, 1200 to 1300 lbs., say 1150 lbs., would, in round numbers, be supplied in the following amounts of each of the several descriptions of food enumerated, supposing them to be of fair average composition in that respect.

AMOUNT OF EACH FOOD CONTAINING 1250 LBS. DRY MATTER.

Cakes.....	12¾	cwts.
Grain or Hay.....	13	"
Swedish Turnips.....	5	tons
Mangolds.....	4¾	"

"The question arises—What would be the cost of 1250 lbs. of dry substance, made up of a suitable mixture of these various foods, to yield 100 lbs. increase in live weight, and whether this would be less or more than the 100 lbs. increase would sell for?

"Well-bred and moderately fattened oxen should yield 58 to 60 per cent. carcass in fasted live-weight; very fat oxen may yield from 65 to 70 per cent. But of the increase obtained during what may be called the fattening period of moderately fattened oxen, it may be reckoned that about 70 per cent. will be carcass. Supposing you get 8d. per lb. for this, the selling value of your 100 lbs. increase in live-weight will be 46s. 8d. Now, I think if you try to make up 1250 lbs. of dry substance by a suitable fattening mixture of the foregoing foods, you will find that it will cost you considerably more than 46s. 8d. Even if roots alone were used, which would not be considered good fattening food, the cost would be more if they were reckoned at their selling price, though less if taken at what is called their "consuming value." But with no good fattening mixture of cake or grain, hay-chaff, and roots, could 1250 lbs. of dry matter be obtained for anything approaching the sum I have estimated as the value of the increase it will produce.

Cost of Manure from Farm Animals.

"It is further to be borne in mind that, weight for weight, store stock is generally dearer than fat stock. You have also to add to the cost of the food various other charges, such as rent of buildings, appliances, attendance and risk. Taking all these things into account, I think it is evident that there must always be a very considerable proportion of the cost of feeding, although varying greatly according to circumstances, which must be taken to represent the cost of the manure.

"In 1876, the Council of the Royal Agricultural Society of England appointed a committee to consider the question of the valuation of unexhausted manures, with reference to the provisions of the Agricultural Holding Act; and a table of the estimated value of the manure obtained by the consumption of different articles of food, which I had first published about 16 years previously, and after reconsideration republished more recently, was was much discussed and criticised. The general impression arrived at was, I think, that my estimates of manure-value were too high. Accordingly, Dr. Gilbert and I selected linseed cake as the best known article of purchased cattle-food, and, after deducting my estimate of the manure-value from the cost of the cake, we endeavored to calculate whether the remainder of the cost could be recovered in the increased value of the animal. The best linseed cake was then quoted at £12, 10s. per ton, and deducting the manure-value as given in my table, namely, £4, 12s. 6d., there was left £7, 17s. 6d. to be charged against the animal, and calculation led us to the conclusion that it was extremely doubtful whether this amount could be recovered in its increased value. In fact, linseed cake appeared to us to command what may be called a fancy price. At any rate, it was quite certain that it could not be profitably used, if not fully as much, or even more, than the amount of my estimate were charged against the manure.

"Although in the foregoing illustrations I have confined my attention to oxen, if the same mode of calculation were applied to sheep and to pigs, it would be found in their case also that the cost of their food is more than the value of the increase it produces. Notwithstanding that the contrary view is so frequently assumed, the use of the term "consuming value," as distinguished from selling price, seems to recognize that food stuffs have a value other than as food alone. If restrictions upon the sale of roots, hay and straw, were abolished, these articles would soon cease to have what may be called a fancy price; and the difference between the so-called "consuming value," and the real selling price, would more nearly represent the value of the manure.

Conclusions

"In the former part of my address, I have shown that, beyond a certain limit, the increase of crop does not keep pace with the increase in the amount of manure applied to the land, and that this is especially the case in advancing from high to still higher farming. I have now adduced evidence which must, I think, convince you that the manures of the farm cost money. It seems to me that an obvious deduction from these two facts is, that to apply manure in such quantity as to obtain a diminished produce for a given amount of it, can only be profitable when the price of produce rises, and not when it falls. So far, however, as increased production is to be attained by the exercise of freedom, intelligence, and economy in management, so as to get the maximum amount and value of produce from the manure that is applied to the land, and the maximum amount and value of meat and manure for the outlay in store-stock and in food, increased production is a necessity of the times, and would prove the best remedy for lower prices of farm produce.

"It is a somewhat humiliating admission to make, though so far it has proved to be too true, that the virgin soils and plains of the United States and Canada can produce, and send to this country, grain and meat cheaper than they can be produced on our own soils at home, with all our boasted skill and science. The opinion expressed by some, that we shall again become exporters of grain, is altogether chimerical. But we have at any rate the cost of transit in favor of home production. This, though a less considerable protection in the case of grain, must always be a material item in the case of live animals, and of meat; and the rearing and feeding of stock must always form an important branch of our farming.

'It is such a generally accepted opinion that the agriculture of Great Britain is superior to that of any other country, that you will perhaps be disposed to resent the allegation that there is very much in your practice which requires improvement. During the last thirty or forty years, our knowledge of the productive effects of different manures, of the food requirements of different animals, of the increase they should yield, and of the value of the manure they produce, has made great progress. But comparatively few British farmers pay attention to such subjects, or care to avail themselves of the information at their disposal. It is true that much of the existing data is not yet available in a form which would be easily intelligible to farmers generally, but this is because there is little demand for such knowledge."

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 382.)

CHAPTER XXVI.

CLEMENT DUNFORTH HINTS AT MISCHIEF.

"So you have relented at last," were his first words, spoken in mild reproach. "Upon my word, my dear fellow, this has scarcely been generous treatment. I did not think you would have me feel the loss of Irene's championship so quickly."

"I do not understand you!" the astonished Noel exclaimed.

"Indeed! And yet I speak plainly enough. I repeat that I have felt both surprised and hurt at being kept at a distance from the man to whom I hope, at some not far distant day, to be nearly related. All yesterday I danced attendance here, expecting every minute that you would ask for me, till I confess that I grew out of humor, and went back to Corby in disgust."

"Why do you stand on such ceremony? I was equally desirous of seeing you. You are not always so punctilious," Noel retorted.

"Why did I not walk in here, as so intimate a friend might naturally conclude that he could do unbidden? Because I was given to understand that I was not to attempt anything of the kind. At one time, when I inquired for you, I was informed that Lord Carisforde was engaged; at another that he was resting, and must not be disturbed; and this, although I knew that a greater stranger—the German *savant*—had been in your room for hours."

Noel was perplexed, and half inclined to be incredulous; yet how could he confess this with the speaker looking so boldly into his eyes?

"It may have been one of Mrs. Hurst's well-meant but mistaken arrangements," he said, dubiously. "It is just possible that she fancied two visitors in one day would be too much for me. She forgets that I am no longer the helpless invalid, but almost ready to take flight."

Clement Dunforth elevated his eyebrows.

"Really! Ah! you mean that you are longing to make the tour of the domain, and so on. Well, I dare say, Dr. Monson will not object to your taking a daily drive in the park."

"I mean nothing of the kind," responded Noel, provoked at his tone. "I consider that I am now sufficiently recovered to go back to town; and as soon as Irene writes to say that I can return without any inconvenience to her—poor girl! I do not wish to add to the number of her burdens—I shall leave Carisforde. Till I can do this, I prefer to remain quietly in the apartments I am now occupying."

"But my dear Carisforde, you are not, you cannot be serious. Have you reflected on the position in which you will find yourself if you quit this house, without leaving yourself and opening for returning hither as its master?"

"I have reflected," said Noel, firmly, though his pale cheek flushed, and his brows contracted.. "But I cannot avail myself of the opening at which you hint; and, after all, I shall but find myself in the old position."

"By no means. Your berth has been filled up, and in your present state of health it will be some time before you can hope to obtain another."

Noel knew this but too well, and was silent, till Clement Dunforth, with an appearance of friendly anxiety, inquired what he proposed doing.

"Settling on Mrs. Estcourt and her children the few hundreds which I am informed are all I can legally call mine, and then pushing my fortunes in one of the colonies."

"If your mind is made up to this," said Clement, slowly—"if you are quite sure you *mean* this, I may be able to assist you. I happen to know two or three persons who are connected with colonial agencies. Will you give me permission to address them in your behalf; or is this scheme you are mooting nothing more than a hastily formed plan which may yet be set aside? I cannot forget, if you do, that the heiress is not likely to prove invulnerable, if addressed by such a veritable hero of romance as yourself—still sunken-eyed and interesting—the victim of an enterprise attempted for her sake. She could not prove a hard-hearted damsel, if you said to her, 'reward me for all I have gone through with your hand and fortune.'"

Noel turned from the speaker with a gesture of annoyance. What could be his motive for suggesting such a line of conduct?

"When I want a reward," he coldly replied, "I will remember all you have said; till then, as this mode of speaking of a very unfortunate young lady positively disgusts me, suppose we change the subject."

"Certainly, we will," was the ready response. "And although, as a man of the world myself, I cannot say that you are acting prudently in refusing such a golden chance, still, it is just what I expected of Irene's brother. One more question, which you must please to understand is not dictated by impertinent curiosity, but that my replies to the questions the agents will put to me may be clear and correct: do you propose going abroad alone?"

"Why do you ask? Have you any idea of accompanying me?" queried Noel, with some reluctance.

In many respects the companionship of a shrewd fellow like Clement Dunforth, might be advantageous; but he did not like him well enough to hail the prospect with much pleasure.

"I? No, thank you. There are ways of earning money in London as well as in the gold fields or diamond diggings: and I decidedly prefer relying on my brains to any mere manual labor. My meaning was this: do you intend taking a wife with you?"

"Do you think," was the vehement retort, "that I would be so dishonorable as to ask any woman to wed me, knowing that I have no home to offer her?"

Noel bit his lip, and regretted his hasty speech as soon as he remembered that Clement Dunforth had just been doing the very thing he was reprobating so strongly. But Clement did not appear at all embarrassed. With rather a supercilious smile, he observed:

"You are a second Chevalier Bayard. You ought to have been born in the days of chivalry; for really, my dear fellow, your notions, although very praiseworthy, and all that, are not adapted to such a practical age as the present. Then it is quite understood that you are prepared to go out a free man, without even the incumbrance of an engagement? But—perhaps I am now going too far——"

"I have no ties either to bind me to England or make me impatient to return here," said Noel. "You can say this much respecting me, if it be absolutely necessary to allude to the subject at all."

"But I must not vouch for your being heart-whole," laughed Clem. "We might have known that you would not have been so utterly impervious to the heiress's attractions if you had not been shielded by some pretty Londoner's charms."

Noel heard this with impenetrable gravity, for he was too much annoyed to smile at it. Clement Dunforth might be in earnest with his proffers of service; but he was rendering it a very difficult matter for the man he was obliging, to feel as grateful as perhaps he ought to be.

While Clement jotted down Lord Carisforde's age and a few other particulars, Noel was revolving with bitterness the little pronoun he had employed a few minutes since. To whom did he allude when he said *we*? Could it be Hillian Gray? The thought gave a little acerbity to his tone, as he inquired how much longer the young lawyer proposed remaining at Cornby.

Clement shrugged his shoulders.

"That is a question you must put to my employers, not me."

"But their affairs appear to allow you an extraordinary amount of leisure."

"Ah!" said Clem, carelessly, "it's astonishing how much a fellow can get through by stealing a few hours from the night."

"At all events you may spare yourself the trouble of coming to Carisforde again, as I shall certainly leave here in two or three days, at farthest."

"I have never considered it a trouble; and Irene would be very angry with me if I neglected calling daily to inquire how you are progressing."

"Then, for Irene's sake, come no more:" Noel responded. "It is not just to her that you should spend so many hours by the side of another."

"You mean the little Gray?" asked Clement, tranquilly, "Pooh! Irene and I are quite as one respecting that young lady."

"I must be excused for doubting this," said Noel. "No young girl can be content to know that her betrothed seeks the society of another so continually and persistently as I hear of your being with Miss Gray."

Clement leaned back in his chair and laughed, as if amused at the charge thus brought against him.

"And so you think I am giving Irene cause to be jealous. Pooh! She knows better, if you do not. You have been shut up in these rooms pleasantly unconscious of what was passing around you; but your sister and I have seen enough to know that Miss Gray—meek, modest Miss Gray—is not what she seems, and that we shall do you a good service by unmasking her."

"And to effect this, you walk with her, talk with her, pay her the most flattering attentions, contrive to throw yourself in her way at every opportunity, and insidiously try to win her confidence. By heavens! This is not work fit for a true man, but only for a traitor and a spy, and so it disgraces you."

Clement Dunforth had leaped to his feet, and stood glaring at the indignant speaker, with his hands clenched, and teeth pressed into his nether lip till the blood came; but his wrathful mood quickly passed away.

"Pshaw! what exaggerated views you take of one's proceedings! Would you quarrel with me for doing my best to unmask this girl?"

"Certainly; for the task does not come within your province. You appear to forget, Mr. Dunforth, that both you and I are simply guests here, and that when you interfere in Miss Carisforde's affairs, you act with a presumption that is inexcusable."

"I suppose you are right," was the reply that came after an embarrassing pause. "I daresay I have let the lawyer's tendency to sift any doubtful case that comes in my way carry me too far. I ought to have consulted you first; you must know better than I do whether Miss Carisforde will prefer to be kept in ignorance of the little Gray's antecedents. Then you had rather I came here no more? and you will bear me blameless with Irene?"

The good humor with which he was yielding to Noel's wishes made the latter regret that he had urged them so rudely. But still he would not propose any middle course. It was better, far better, that Clement Dunforth should cause some surprise by thus suddenly ceasing to visit at the Park, than that he should either continue the ignoble espial on which he professed to be engaged, or arouse the suspicions of Irene.

When these reflections had passed rapidly through his mind, Noel extended his hand, with more cordiality than he could generally bring himself to testify, saying, as he did so:

"Pray excuse me if I have appeared ill-natured, and accept my thanks for the readiness with which you have consented to come here no more. I will not forget what I owe to Miss Carisforde. Before I leave here I will have an interview with Hillian Gray, and point out to her that it would not be consistent with my duty to my generous kinswoman to let your revelations pass by without asking her to explain them."

"Must my name be brought into question? Recollect that I did not volunteer this information."

"I will not mention my informant, if I can help it," Noel assured him. "If Miss Gray is able, as I hope she will be, to prove that there has been nothing wrong in her conduct"—Clement's smile and shrug made the speaker wince—"nothing that can reflect on her character, I shall keep her secret."

"And if not?" asked Clement, curiously.

Noel averted his face. It was horrible to think that there were two sides to the question—that if there was any truth in Clement's statement, Hillian could not be as blameless as he wished to think her!

"I must be guided by circumstances," he muttered, agitatedly. "If Miss Gray sees that it will be my duty to inform my kinswoman of what I have heard, I hope she will spare me the pain of doing so by withdrawing from here."

"It is a tangled coil; better let it alone," Clement counselled; "unless you have changed your mind, and wish to ingratiate yourself with the heiress. In that case, you could not have a more favorable opportunity: you deprive her of her friend, but you offer instead—a lover. What, are you growing angry again? Then I will go before the storm bursts on my head. Adieu. Our next meeting will be, I suppose, at Mrs. Estcourt's. Yet, no; I was forgetting that you are still so far from strong. Don't neglect to drop me a line when you propose leaving here, that I may meet you at Corby station, and make what arrangements I can for your comfort on the journey."

Again Noel felt constrained to thank him, and after some further conversation, they parted on more friendly terms than usual; Clement, or so he asserted, to make up by some hours' hard work for the time lost on the preceding day; and the invalid to test his returning strength, sometimes with the aid of a crutch, sometimes with Jephson's arm, up and down the wide corridor, into which his apartments opened.—To be continued.

OUR SCHOOLS.

S. B. PECK.

It is very cheering to one who has battled orally and with pen for years against universal opposition, with full confidence in the correctness of the principles he has adopted and expressed, and fully believing that he has but to wait with patience when his views will be generally adopted, to see at last that he has not labored in vain.

As far back as 1840, when I first sent my daughters to a public school, after having made considerable progress in their education at home under my own tuition, I tried to persuade their teacher to dispense entirely with columns of words in their spelling lessons, arguing thus: a word to be appreciated as of any value must be in a sentence, and that there its orthography and meaning should be associated, each helping to fix the other in the memory, and that the child should never be required to give the orthography of a word that he did not know the meaning of. The reply I got was, "the trustees will never tolerate such an innovation." I considered that I had the best answer that could possibly be given, and continued my home-teaching in my own way. The result is that to-day, though my daughters are matrons, they have never been beaten in orthography. Some years subsequently a wealthy man of Genesee County, N. Y., offered a prize for the best essay on school teaching, which was procured and published in a book and donated to every school district library in the State of New York, and there in that book my ideas of teaching this branch were for the first time seconded.

I have lived to see my ideas on this and many other matters of teaching adopted in high places, but I am specially cheered by the expression of Prof. Beal in the RURAL, 22d March last: "Spelling is best learned in connection with reading." Reading this brought the whole matter forcibly to my mind.

I can heartily agree with Mr. Beal in his ideas of the teaching of grammar and arithmetic, but if in his remarks about "spelling reform" he alludes to the introduction of the Phonetic language, I have not the hope that he expresses of ever seeing this reform adopted, and my thoughts at once recur to a time over twenty years past when a Phonetic tract distributor and myself sat on two big boulders in my garden and argued the case, he for and I against the probability of this, his promised reform, ever being adopted.

It is true that since that time the *c* in the old *scythe* has been dropt, *u* has taken the place of the *ugh* in *plough*, and many other similar changes or reforms have taken place and many other words are likely to be changed, but so far as I have ever learned, these changes have never been made by any vote, or by the action of any association of men, but rather by common assent, the most common if not the best authority for any change in orthography or grammar. I see that the *e* in *height* is lately left out, but can any one set or association of men give a reason why at the same time the word should not have been spelt *hite*? To spell the word *phthisic*, *tizik* would seem to be a reform, but what M. D. seeing the word by itself would ever guess its meaning?

Teaching language, or more properly teaching the "young idea" not specially "how to shoot," but what the child needs to know to qualify him for even a medium station in life, I look upon as a high art worthy the study and investigation of a literary Edison, and I look hopefully forward to the time when great improvements in this branch of science will be inaugurated.

"RAISED."

No barber knoweth whom he may shave, and the man who rushes into a shop and drops into a barber-chair, without seeing who occupies the next chair to the right or left, may get badly left, as a case proved yesterday. A solid old citizen in the wholesale trade was taking it easy, his face covered with lather, when in came a young man who flung off his coat, bounced into a chair, and called out:

"Hurry up, now, for I must get back to the store before old Blank does, or he will raise thunder! Hang him, he won't even give a man time to die!"

The solid citizen turned his face to glance at the other, and the barber noticed a reddening of his face.

"Going on a vacation this summer?" asked the barber who was preparing to shave the young man.

"Vacation! How in Tophet can I get away from old Blank? And if I could he pays such a stingy, contemptible salary that I couldn't afford even a ride on the ferry boat!"

"Why don't you ask him for a raise? queried the barber.

"Why don't I ask for the hand of his freckle-nosed daughter? He'd discharge me in a minute, though he's making money and can afford it. If the old hyena would have a stroke of apoplexy the junior partner might do something, but such chaps always live to be a hundred years old."

Conversation ceased here, the solid man got out of his chair, took a brushing and sat down, and when the clerk arose from his chair and turned around snow-balls would have looked black beside his face. He tried to bow and speak, but something wouldn't let him, and when he started to put on his coat he held it tails up and collar down. He was still struggling with it when the solid man rose up, looked around and walked out, saying never a word. The barber wet the young man's head and held cologne to his nose, but he walked sideways when he went out, and there was an uncertain wobble to his knees. In applying for the vacant position to-day state what shop you shave at.—*Detroit Free Press.*

AS TO TREATING ONE'S FRIENDS.

THE "Methodist" says kind words for the "moderation" reform movement which aims at stopping the habit of treating to drinks. But it would go further and stop the practice of treating to car fares. "It is desirable, we think, to get under the principle of good will and manliness that supports treating. We beg leave, therefore, to say that it is not manly and courteous, but just the reverse, to pay another's bill without being asked to do so, or when there is no reason to believe that the other is unable to pay. The man who pays his neighbor's car fare, lunch ticket, or concert ticket, without express permission, does an ungentlemanly thing, a vulgar thing, which a well-bred man will never do without a sense of personal humiliation. The well-bred man may do these things because he knows they are the custom of the imperfectly-civilized people among whom he lives, but he will feel that he degrades himself by doing them. The principle is a very simple one: when you pay another man's car fare without his request, spoken or implied, you assume the right to create an obligation, and this assumption is bad manners."

CELLULOID is rapidly coming into use as a substitute for ivory, horn, bone, shell, coral, etc., in the manufacture of combs, knife-handles, canes, piano-keys, pen-holders, card-cases, jewelry, harness and carriage trimmings, and a great variety of other articles. Even collars and cuffs are made of it. It is said to be a compound of cotton, nitric acid, and camphor,—a nice little inflammable combination to scatter all about our houses, and wear on our persons, and carry in our pockets. It was invented in 1870, and has grown to great proportions in the field of manufactures. Being neat and cheap and popular, small thought will be given to any stupid considerations of safety. And very likely it is no more dangerous than some of our other favorite goods and playthings.

RAISING CATS IN HOLLAND.—The common cat is largely fed on fish, and bred for its fur, in Holland, where the finest skins are obtained. Large quantities are also collected in Holstein, Bavaria, and Switzerland. In France about thirty thousand cat skins are furnished annually to commerce. This fur is greatly valued, while the supply of good skins is far too short of the demand. The black, spotted, and striped varieties are all much in request for making into wrappers for open carriages, sleigh robes, and for railway traveling.

THE "Sunday Afternoon" says:—"One of the most remarkable things in human nature is the willingness of women to sacrifice a girl's life for the chance of saving a scapegrace man. If a pious mother can only marry her son Beelzebub to some "good, religious girl," the chance of his reformation is greatly increased. The girl is neither here nor there, when one considers the necessity for saving the dear Beelzebub.

MILLSTONES made of glass are a German novelty eight pieces of glass of equal size are used as *nuclei;* a counter piece of granite is bound to the outer form with cement. The advantages claimed are that they run easily, grind cool, and produce finer, lighter flour than French buhrs. But a few are in actual operation.

RECENT LITERATURE.

The Hearing, and How to Keep it. BY CHAS. H. BURNETT, M. D. Philadelphia: Lindsay & Blakiston. Price, 50 cents.

This is the first of the American Health Primer series. The book is divided into three parts. The first treats of the anatomy and physiology of the ear; the second, of the chief diseases and injuries of the ear and the avoidance of their improper treatment, and the third of the general hygiene of the ear. The second chapter of part third is devoted to the care of the ear in disease, including the relief of partial deafness and the education of partially deaf children and deaf mutes. The subject is very thoroughly treated, while the absence of technicalities of language, and the excellent engravings which illustrate the text, serve to make the book admirably adapted for the general reading public. A few extracts will give a faint idea of some of the useful information the book contains: "It may be said, for the comfort of friends and parents, that no bead, button, 'spit-ball,' bean, grain of wheat, maize, or any similar small, smooth object which a child could put in its ear will do any harm, *if let alone* by all save one entirely conversant with the structure of the ear and properly supplied with instruments for examination and treatment. If your child, therefore, gets any such foreign matter in its ear, rest assured such object has not gone beyond reach of surgical skill. The harm in such cases *usually* arises from the unskilful means resorted to, in haste and consternation, for its removal. Let it alone until it can be properly removed." * * * * * "Sweet oil is one of the articles not to be dropped into the ear for earache; for it will not cure the pain, to begin with, and it is greasy, and hence—for the treatment of the ear—dirty: it is heavy, sticky and cloggy." There is also a number of other injurious matters which are often, but should *not* be, put into the ear when it is inflamed and aching. Prominent among these is the core of a roasted onion. "Every one should learn that a poultice over either the ear or eye will act injuriously on the organ. If a poultice of any kind be placed over an inflamed ear for a short time, even for a few hours, irreparable injury may be done. Not only may the hearing be destroyed by such mismanagement of the ear, but a chronic running from the ear may be thus established." The author then proceeds to give explicit directions for properly treating ears that have become diseased. A more useful little book it would be hard to find.

Life of Benjamin F. Butler: By T. A. BLAND, M. D. Boston: Lee & Shepherd. Cloth, $1. Paper, 50 cents.

The author of this eulogy—for it is nothing else—has a most intense admiration for the subject of his praises. Butler, according to this authority, has the brain of a Franklin, the firmness of a Jackson, the intellectual force of a Bacon, the integrity of an Aristides and the ripe scholarship of a Cushing." The life of such a man as Butler cannot fail to have elements of interest in it, however prejudiced the biographer may be, and though one cannot but smile at the extravagant panegyrics lavished so continuously on the General the book is interesting in the extreme.

Songs, Legends and Ballads: By JOHN BOYLE O'REILLY. Boston: The Pilot Publishing Co. Price $1.50.

Mr. O'Reilly is favorably known to a large class of readers through his intensely dramatic pictures of Australian life. His "King of the Vasse" particularly having won for him golden opinions from the press both here and abroad. The poems of this author are conspicuous for earnestness, originality and purity of tone, while their freedom from mawkish sentimentality and affectation make them most delightful reading.

Spiritual Songs for Social Worship: New York: Chas. Scribner's Sons.

This collection of hymns and tunes is an abridged edition of Dr. Robinson's popular "Spiritual songs," noticed in these columns a few weeks ago. These "songs" are designed especially for conference and prayer-meetings. There are 553 hymns 330 tunes. The fine paper, the clear type, the firm and handsome cloth binding make a most attractive volume. The prices at which it is offered (75c. single copy, 60c. in quantities) are marvelously low.

MAGAZINES.

IT is announced that LIPPINCOTT'S MAGAZINE for July will present some extraordinary attractions both in its reading matter and its illustrations. Among the articles there will be a defence of Franklin against his prejudiced English critics, by Thomas Hughes, author of Tom Brown's School-Days; a biography of Joe Jefferson, from material furnished by himself, with potraits of him as seated in his studio, and in each act of Rip Van Winkle, and views of his country-seat in New Jersey; an exquisitely illustrated description of a charming New England village—Stratford-on-the-Sound; and the opening paper of a series by Dr. Felix L. Oswald, giving sketches with pen and pencil of travel and adventure around the wonderful and unfamiliar scenery of the back woods of Mexico and Central America. The whole number will be specially adapted to furnish entertainment alike to the summer tourist and the family circle at home.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

TRULY SPOKEN.

M. A. B.

THE words of your correspondent, Miss. Harvey, concerning our duty to ourselves as individual souls, are full of truth and worthy of frequent thought. There have been intrusted to each of us certain talents to put to usury. In giving an account of our stewardship, to say that we have had no time to care for our own talents, much less to increase them, and so they have rusted out while we have been spending our strength for others, will it, think you, secure for us the welcome commendation, "Well done, good and faithful servant," &c.? Manifestly, self-improvement is our solemn duty. It is, do unto others as we would that they should do unto us, not, more than we would permit them to do for us, that is required. The widow's mite was so acceptable a gift because she gave her all, not because she gave more than was hers to give, and thus sinned in the giving—for even so commendable a virtue as self-sacrifice may be carried to such an excess as to become a sin. No, not only have we incumbent upon us certain duties, but we have certain rights of which

we are the God-constituted and sole guardians, and which, whatever the claims of others upon us, we cannot blamelessly ignore.

But aside from the moral aspect of the question, we owe it to our children to keep our minds in a vigorous growing state, and we must do it if we would retain their love and respect. That filial love will withstand, unabated, the strain of mortification, is too much to expect of human nature. A case in point occurs to me: A young college friend, a very worthy young man, recently called upon me bringing with him his mother. Now, that mother loved her son almost to adoration, and there was no sacrifice which her gray hairs would have deemed too great to promote his physical comfort. Yet so thoroughly did the mother ignore every rule of grammar and etiquette, while her conversation evinced an ignorance so complete, that the afternoon was evidently one of torture to the young man, and when next he goes calling, he will doubtless choose some more congenial companion or go alone. This mother defers to the smallest wish of her son, treating him as if he was a guest, yet if she had taught him to wait upon himself, even, to say nothing of waiting upon her, and had spent the time thus gained in self-improvement, how much better for the young man, and how much more he would have loved and respected his well-informed mother, whom he could have regarded with a just pride, than his ignorant parent with all her kindly solicitude for his physical well-being!

In still another sense do we owe self-culture to ourselves and to our children. Always pitiful to behold is the imbecility of old age but doubly pitiful is the senility of a mind which has never known anything but vacuity. To have some subject outside of our daily routine of life with its cares and worries innumerable, to which we can turn with interest and mental refreshment, is quite worth while on the score of health—and the importance of health cannot be over-estimated—to say nothing of the resources within ourselves which it gives us in time of sickness or trouble. It may be said that household cares leave no time for self-culture, and that country life affords no opportunities for self-improvement. Let not those who find time for fancy work, delightful as it is, and for those feminine follies, patchwork bed-quilts, be so inconsistent as to say *they* have no time for self-improvement. Though the writer is not fully in sympathy with all that Emily Faithful (who has so well shown in her own life what feminine pluck and perseverance can accomplish) has said, it will do no harm to have her opinion of fancy work: "If the wretched little child's play, which women call fancy work, could at once be blotted out of existence, it would be an incalculable blessing. What would be thought of a man or grown boy, who could deliberately sit down, day after day, and be content to kill time by working ridiculous little pen-wipers, or bead napkin rings which no one ever dreams of using? He would be considered and rightly, either a fool or crazy."

Smith College, Wellesley, Vassar, Mount Holyoke Seminary, and many other institutions for our sex, are constantly demonstrating that, in mental capacity, we are not a whit the inferiors of the sterner sex. Why, then, should we fritter away our time in any less serious employments than they? As to lack of time for self-improvement, there are many household labors which are merely mechanical, leaving the mind unoccupied, and affording time for thinking of topics other than the work in hand. Well does the writer remember some November days when the cream would foam, and the butter wouldn't come, and the hands would blister, but lying upon the churn cover and relieving the tedium of the seemingly interminable operation, was a Latin grammar. In this way, all the rules of syntax were thoroughly learned, and even those long lists of prepositions, which learners love to skip, will always be at the tongue's end, ready to slip off at a moment's warning. So also were many pages of history read. Mrs. Stowe is said to have written portions of "Uncle Tom's Cabin," of world-wide fame, with her portfolio on her knee beside the kitchen stove, in the intervals of domestic labor.

Among the blessings for which De Quincy was wont to be thankful was that he had "lived in rustic solitude." And so it is, the disadvantages of the country with its pure air, fragant scents, its sweet singing of the birds and insect hum, and inspiring sounds and sights of Nature, as compared with the stifling atmosphere, the hurry and turmoil of the city are not so great, or real, as might be supposed. It is not the number of advantages enjoyed, not the amount of knowledge acquired, which constitute the different degrees of intelligence among people, it is the use we make of our advantages, and our wise selection of the things we would know, which counts." Books bring us into ever-renewing communion with all that is best and noblest in the thought of the past, the winnowed and garnered wisdom of the ages;" yet the question is not how many books we can read and study, but how much we can digest and assimilate, and make a part of our mental fabric. While the writer of this article is personally acquainted with the management of the "Society to Encourage Studies at Home," and has the fullest confidence in its beneficent work, she would say to those whose limited time forbids their joining that Society, don't be discouraged. With the present low prices of Harper's publications, and those of many other establishments, a little extra economy will provide all needed books. We all of us think there are some things which we cannot afford, and in many families books are classed among the luxuries of life, instead of among its necessities as they should be. Many a house has its piano, and hundreds of dollars are annually expended for music lessons, with no other result than a waste of time. Where no musical talent exists even mediocrity cannot be implanted. Except in cases of marked musical taste, this money had better be saved, and a tithe of it invested in books would yield much larger returns.

But if there be a bona fide desire to learn, we shall make for ourselves opportunities, and the very obstacles overcome will conduce to mental strength. Daniel Webster's colossal mind won admiration, but it is said that in his boyhood his reading was sometimes confined to the limited range of an old almanac, "I am always learning," was Michael Angelo's motto, and it is a good one. Always keep the mind on the alert. No one can say of any department of human learning, here in lies all knowledge, for knowledge is as wide as the universe. "Of all their faculties," said Thoreau, "many people seem to have found only their hands and feet." So then the completest education consists not necessarily in the fullest acquaintance with the greatest number of books, but in the fullest possession of our own faculties. Neither college nor school room are indispensable to the perfect education. As to books, get a cyclopedia if possible, but by all means get a dictionary, the larger the edition the better, of course, but even a pocket dictionary is better than none, and *use it*. Whatever you read, read carefully, and for every word not perfectly understood, turn to the dictionary. If possible, let no fact, however small pass without understanding it, and let no day go by without some new fact gained.

Keep your books always at hand, and turn to them immediately whenever a question occurs. Aim to cultivate always a habit of thought, a habit of taking broad, common sense views of things, of getting a clear, well defined idea of even the smallest subjects. Have you a taste for Natural History? To hold communion with the visible forms of Nature and listen to the various languages she speaks, is the especial privilege of the country dweller. To be able to recognize, and call by name, the species of our feathered friends, as they come to us year by year, marking the progress of the beautiful spring season, is a pleasure, indeed; so also the annual reappearance of the plants and other forms of animate nature. Text-books, guiding one unaided into the elements of the various branches of Natural History, can now be obtained at from 75c. to $3 each. I shall not soon forget the pleasure with which a lady friend, compelled by circumstances to spend last winter in a lonely Western cabin, wrote me of the time thus gained for her favorite text-books.

No, the half-hour now and then from pressing household labors should not be taken surreptitiously, as wronging others, but claimed, no matter how much work may press, both as a duty and a right. There is encouragement in the difficulties which others have wrested with, and conquered, though the history of the obstacles which our own sex have met and overcome, is largely unwritten. Hugh Miller educated himself for the fame which awaited him as author and geologist, while engaged in the laborious employment of a stone mason. Dr. Hitchcock, of our own country, divine, geologist and college president, gained his education while following the plow. Mary Somerville, with few early advantages, thwarted in her own efforts at self-culture, free to follow the bent of her natural tastes only after she became a widow, made herself a name and fame for great mathematical and other attainments. It was one of Mrs. Somerville's works of which it was said that not more than four men in France could follow its profound reasoning. Nature has not fitted us all, nor could we all expect, if we would, to be fame's favorites. But when we see what seemingly insuperable obstacles others have overcome, we may well take heart. Culture is within the reach of all, and if we persevere, our efforts will conquer reward.

But mental culture is not the only one requisite for a noble character, there is a culture of the heart, of the humanities of life, which must accompany it. We need to eradicate from our characters the remains of the savage, the almost imperceptible inclinations to take advantage by word or deed of others—the little foxes as Mrs. Stowe calls them—and to replace them by the broadest catholic charity and sympathy. Nature has many beautiful features often so charmingly combined as to form the perfect landscape, and even in the invisible atom the microscope reveals beauties which language is too poor to portray; but the most beautiful thing of all, is the symmetrical human character.

WHAT SHALL BE DONE WITH THE CHILDREN?

GLADDYS WAYNE.

One important point is to interest them. Whether it be work or play, once succeed in awakening a lively interest and more than half is accomplished. And let us bear in mind that even the amusements of children must be often varied; sameness seems as inconsistent with their nature as is a life of confinement to the free bird of the forest. This is true of all children. But it is of the country children, more particularly, that I now speak to the mothers.

With the advent of spring, the amusements and little round of duties that served to render enjoyable the winter days and evenings, become irksome. Nature is waking from her ice-bound sleep; every enfranchised rill, each springing blade and swelling bud, each opening flower, the gladsome notes of wildwood birds, sunshine and balmy air—all the mysterious influences of earth and air and sky—call to us, "Come forth."

Often more wise in their instincts than we, in response to the alluring call, every lad and lassie forth will go, unless the "bolts and bars" of dire command or stern necessity intervene. And as the season advances, the more time spent out-of-doors, so that proper discrimination in regard to the weather, etc., be exercised, the better. Then let them be encouraged in all innocent out-door occupations and pastimes. Do not forget that "all work and no play" makes a dull life for any child.

In spring-time, many an object of interest may be found in nature's newly revealed treasures. The pleasant search for early wild flowers has a peculiar fascination that might serve to awaken an interest in the botany which you have been premeditating for them.

In attempting to partially solve our problem, let us go back further than the thought advanced at the beginning. Here are "wheels within wheels." The chief point is to succeed in making home an object of personal though not selfish, interest to your children.

Do you complain that you find no time for the culture of the flowers you used to love so well? Suppose that to each child is given a little plot for flowers—only as much as can be cared for easily and well—to cultivate individually, yourself now and then giving a little advice or assistance, if necessary, not forgetting the word of deserved praise. Perhaps the morning glories would fall to your share; they well repay the loving hand that cares for them.

In the garden, to each child might be given the privilege to choose one or two kinds of plants or vegetables to cultivate. Almost any child could care nicely for a few hills of strawberries, and find more than ordinary delight in the service. But whether in yard or garden, let there be an unchageable law that no more shall be attempted than can be easily performed—that whatever is done be well done.

In many families the principal care of the fowls might devolve on the children, and be a pleasing task if performed with the understanding that a certain number or percentage of the chickens and turkeys were to be theirs, to name, to pet and call their own, and, better still, to be their very own, to sell and invest the precious proceeds in books, papers, pictures, a microscope, stereoscope—whatever serves to instruct, amuse, and to invest home with new interest and charms.

Thought aroused, and love will seek out many ways in which parents may bless their childrens' lives. Rightly blessed, the blessing redounds, through all the after years, to the parents' own peace and happiness. But, dear mothers, "Except the Lord build the house, they labor in vain that build it." Except the "Spirit of Christ" be in our hearts and homes, they lack the vital elements of true peace and blessedness.

Again I urge, beautify home in its appointments and surroundings. Having awakened the enthusiasm of your children, and secured their willing co-operation in the work, you have done much, very much, toward making a pleasant home for them. And one of your greatest aims in life should be that to your children no spot on earth may be so dear as home.

OVER-WORK.

CLAIRE.

Now that the warm days have come and still are coming, I earnestly enter a protest against over-work. Let the tired farmer's wife, if she values health, happiness and long life, make her work now as light as possible. No need of spending the "long, weary day", in unnecessary labor. Shall I tell you how we manage to get our work done in the forenoon, never keeping a fire after dinner until tea time?

There are seven in the family making no allowance for company or extra help in hurrying times.

There are two of us, to do the dish washing, baking, washing, ironing, sweeping and to care for the milk of six cows, the eighth member of the family, Nero, doing the churning. One of us gets up in the morning at five makes the kitchen fire gets the breakfast, puts the beds airing and strains the milk. The other works the butter, skims the milk and does the baking if necessary, while the dishes are washed the sleeping rooms put in order, and the vegetables prepared for dinner. After the dinner is eaten, dishes washed, kitchen put in order, nothing more is done until tea time, and everything requiring time, being made ready in the morning, but little fire is needed to boil the tea-kettle. Washing day, one of us goes to washing as soon as breakfast is over, while the other washes the dishes, and does the rest of the housework, so there is no more confusion or disorder that day, than any other, and the dinner is just as good.

If the ironing is large, it is done in two forenoons instead of taking all day, the baking being done at the same time. Perhaps we don't have the variety of food, that our neighbors do, but we never have poor bread, always make yeast bread and have it baked by nine in the morning. We seldom have hot cakes or biscuits for supper, take our puddings and custards cold, have cold meats, salads, home-made cheese, and never a pie when there are fresh strawberries or fruit of any kind.

We don't profess model housekeeping, there are many things a critical eye would see amiss in our household but I have learned from dear experience that there is often "luck in leisure" and that over-work means a call from our family doctor. It is a very good thing to remember, that it is only required of us to do that which we are able to perform. There is always another day coming and when health and comfort are to suffer in consequence, it is better "to leave until to-morrow" something that could be done to-day.

We bring no tired, cross, heated faces to the table and enjoy our meals just as well. If we have not a great amount of dainties, the preparation of which, takes so much time and strength. We find it very pleasant in the cool sitting room or under the shade of a tree and with sewing or a book, we almost forget there ever was a hot kitchen, or a "weary woman."

HOW TO CLEAR AWAY THE DINNER THINGS.

MRS. M. L. SAYERS.

There should be two persons—and here children's help comes in admirably. The help must must move around the table with a waiter, and take up the knives and forks, placing them all with the handles the same way, that they may not get greased, for it is not *everybody* who has waterproof knife-handles. Remove all things not to be emptied; particularly sweet things, in fly-time. For convenience small jars should be used in putting up fruits, for if preserves and pickles be returned to the jars, they are likely to ferment; if left in open dishes, they will dry out; nor are the dishes, in their daubed condition, fit to be placed upon the table again. Then, on common occasions, set the jars, in which the fruits were wintered, on the table, and save yourself the trouble of dipping to and fro, cooking over fermenting fruits and washing dingy glass-ware. Wait for some grand *fete*, when your best glass and silver may glisten with splendor undimmed by too frequent use and careless washing.

Having removed the fruits to their accustomed dark shelf in a cool closet, remove to the spring-house or refrigerator, in covered dishes, all the vegetables which will make a *mess* for the coming morrow. Smooth over the mashed potatoes into a mass in one end of the dish, in the morning slice and fry brown, in hot grease, for breakfast. Cut up the scraps of cold fowl or beef (or both), and biscuit for hash. The remains of corn, beans, butter, cream, or milk and bread may go together for succotash or gumbo, for to-morrow's dinner, or, the same with tomatoes, chopped potatoes and squash, added, will make a Brunswick stew for breakfast. Bread crumbs, bits of butter, preserves and milk, with fresh beaten egg, will make a nice Economy pudding for to-morrow's dessert—most vegetables, if kept cool, are better the second day of cooking. If there is not time for chopping or preparing, place all the ingredients for each mess, together, and set in a cool place; scrape the plates into a bucket kept for chicken feed, stack and slide to the right hand corner of the table where the pitchers, glass and silver have already been placed by the help. Have a dish-pan full of boiling-hot water and a mop made by tying thread around a wooden handle, (old fringe, now *obsolete*, from counterpanes, makes good ones); when the silver has been washed, add soap and wash those things containing least grease—first: turn them up on a waiter or salver, on the left side to drain, while the help rubs briskly with a dry linen towel, (old table-cloths or wearing apparel make good ones) till they receive a brilliant polish. This must be done while the dishes are hot from the water. When done, wash the oil-cloth or table with the greasy dish-water, wipe dry and carry out the water, empty it into a kettle on the stove, wring the mop and stick it up to dry, wipe the pan and hang it on the wall, and when the kitchen things have been washed and scraped (a clam shell makes a good scraper), pour the top of the water into the chicken bucket on the stove, the remainder into the slop jar.

CORRESPONDENTS' CORNER.

WILDWOOD FLOWERS.

The following poem is sent in response to an inquiry in the "Correspondents' Corner."

The flowers that I saw in the wildwood,
Have since drooped their beautiful leaves,
And the many dear friends of my childhood,
Have slumbered for years in their graves.
But the bloom on the flowers I remember,
Though their smiles I may never more see,
For the cold, chilly winds of December,
Stole my flowers, my companions, from me.

The roses may bloom on the morrow,
And the many dear friends I have won;
But my heart can ne'er part with sorrow
When I think of the ones that are gone.
It's no wonder that I'm brokenhearted,
Or stricken with sorrow should be;
We have met, we have loved, we have parted
My flowers, my companions, and me.

How dark looks this world, and how dreary,
When we part with the ones that we love;
But there is rest for the faint and the weary,
And friends meet with loved ones above.
But in Heaven, I can but remember,
When from earth this proud soul shall be free,
That no cold, chilling winds of December,
Shall part my companions, and me.

Sheltonville, Ga. E. P. R.

MONTGOMERY, Ala., June 7, 1879.

RURAL NEW-YORKER: In the RURAL NEW-YORKER of June 7, I read, under the head "Various," the statements of church property and expenses of maintenance of worship, under the voluntary system, in the State of New York. Now it strikes me that you are thoroughly oblivious of the fact that there is another Christian Church in the State of New York, and that strangers who visit that State must be better informed than the managers of the RURAL NEW-YORKER. I saw a vast Cathedral in the city of New York, in which it would be possible to put half a dozen of the largest churches of the 6,320 you enumerate. Perhaps ten times as many worship daily in its walls as are ever included on Sundays in the walls of the 6,320. There are at least 30 others in the city of New York, and those who built your railroads and canals have constructed hundreds of others in the State. You see the cross and the keys of St. Peter at every village and station, and yet, when writing the statistics of Christian Churches, you omit all mention of them: Perhaps you do not consider them Christians? They may not pay as large salaries to the clergy as some of those you specify, but they furnish a much larger proportion of *real communicants* than any or all of those you name. Please publish this in your paper, to which I am a subscriber, and if you can find a Catholic almanac in the city of New York, add the statistics and compare with those you publish.

HENRY C. SEMPLE.

The number of Roman Catholic churches in the Archdiocese of New York, comprising the city and county of New York and the counties south of the forty-second degree north latitude, is 150. The Catholic population of those counties about 600,000. We cannot find a record of the number of the communicants.—[EDS.

CROP REPORTS.

(Continued from page 394.)

LANCASTER, Fairfield Co., Ohio.—The wheat acreage is equal to that of 1878, and the crop excellent, though a shade less than that of last year—say, seven-eights of last year's crop. The corn prospect was never poorer; the seven-eights acreage under it being about an average one. Much of the present crop has been replanted twice—as, the seed corn of the two first sowings was frozen and would not germinate. It is not likely to be more than half to two-thirds of the usual yield. Many insects are at work on corn. Early potatoes are fair; there is less trouble with Colorado bugs than last year. Late potatoes are not far enough advanced to estimate how they will turn out. Much depends on the balance of the season. Small fruits, berries, etc., are very light, except strawberries, which are abundant. No peaches. Half to two-thirds of a crop of apples. W. D.

FELICITY, Clermont Co., O.,—We have just had a "tremendous" season for setting and handling tobacco. Wheat looks tolerably well. Oats are very bad. Farmers in this vicinity have had a great deal of trouble in getting seed corn to grow. Some planted the crop three times and then did not get a good stand. Last year's corn does not grow well. There was no rain of any consequence in May. The drought and the temperance cause together, have thinned the ranks of the topers in this county. C. L. A.

MOOREFIELD, Harrison Co., Ohio.—We had a very dry spring, and wheat will be short in straw, but the heads are of a good length. We shall have an average crop. On account of bad seed, corn is small, but doing well now, and the prospects are fair. Oats are very short. Potatoes are good, but only a few are planted. There will probably be sufficient apples for home use, but scarcely any peaches or cherries. The worms have destroyed a great many of the currants. The late rains are making plenty of grass. J. N. L.

PETERSBURGH, Lawrence Co., O.—Wheat is very discouraging in Lawrence county. I think it averages about 12 or 14 bushels per acre. The corn is not promising in this section of the country; on account of the frosts and cut-worms, it had to be nearly all replanted. Oats are a very promising crop. J. A. S.

GALLIPOLIS, Gallia Co., O.—The long drought in April and May has been very disastrous to hay and corn. Some are now planting corn for the third time, the seed having rotted in the ground. Wheat will be 75 per cent. of an average crop; corn, 50; potatoes, 90; fruit, 80. J. C. V.

VALLEY MILLS, Marion Co., Ind.—A very large area of wheat promises an abundant harvest. There is a broader acreage than usual of oats and, tho' late, it is looking fair. There is a vast acreage under corn. It is mostly small. Much replanting has been done. As July and August are the months to bring out corn, no reliable prediction of the crop can now be made. Early potatoes have been flourishing, but are now receiving a sad check from the beetles. Many acres of late ones are just planted, and many yet to be planted. There may be half a crop of apples and only a few pears. W. B. T.

PLEASANT LAKE, Steuben Co., Ind.—Wheat looks well in this section—never better. Corn will be backward on account of having had to be replanted from one to three times. Oats bid fair to be a good crop. Apples will be very scarce, but there will be a few in some orchards. Of peaches there will be only a few. We shall have some of late red cherries. There are more potatoes planted than last year; but that bug is on hand as usual, ready for its share of potatoes and Paris-green. We are having plenty of rain now for the late grass. The hay crop will be light. H. B. D.

LA GRANGE, La Grange Co., Ind.—Prospects for wheat are good; it is in bloom. Corn is small; lots of farmers had to replant; but a larger acreage was planted this spring than usual. Potatoes look well; bugs are not very numerous. There will be fair crops of apples and cherries—peaches all gone. Raspberries and strawberries, plentiful. I. F.

DOWAGIAC, Cass Co., Mich.—Corn is looking well, though some had to be replanted. Wheat rather thin, but bids fair for an average crop. Potatoes look as well as I ever saw them. Our old enemy, the beetle, has come again, but has done no injury as yet. Fruit trees blossomed very full and still appear all right. Small fruits in abundance. R. E. C.

DELAFIELD, Waukesha Co.—The winter wheat, of which there is a large area sown, promises well. Say, 25 bushels to the acre. Spring wheat is a medium crop. Oats will be heavy. Barley, good. Potatoes and corn, an even stand, doing well. Meadows are about half a crop. All grain has a good healthy color. H. F. S.

RIVER FALLS, Pierce Co., Wis.—A very dry spring without rain till May 9, affected our wheat and oat crop very much. Drilled wheat is generally good; broadcast sowing, which comprises most of our grain, is thin, and consequently light. What is growing now looks well. Liberal estimates, with the remainder of the season favorable, anticipate two-thirds of a crop. Corn is doing well. Potatoes are in fine condition—with plenty of bugs. Fruit will generally be scarce, except strawberries, which promise abundance. Late frosts have destroyed the fruit. R. J. W.

ENTERPRISE, Winona Co., Minn.—Spring wheat is looking well, but thin on the ground, because poor, rejected spring wheat was used for seed. Corn is about the average for this time of year. Potatoes look promising; a larger acreage is planted than usual. Fruit is poor—about half a crop. Oats and barley are above the average. J. G.

LETTS, Louisa Co., Iowa.—Fall wheat looks very promising; spring wheat is thin on the ground and just heading; the heads are long, and it will probably be an average crop. Rye is thin on the ground—a light crop is anticipated. Oats are coming on fast, and will be an average yield. Corn looks fine; it is being plowed the second time. Apples are a poor crop. Peaches, none. Cherries plentiful, and the same can be said of grapes, gooseberries and other small fruit. Weather delightful. W. M. N.

DAVID CITY, Butler Co., Nebraska.—Our wheat crop in this immediate locality is very materially injured by the continued dry weather, and is being injured also by grasshoppers. Our corn and potatoes are looking fine, and, should we have seasonable weather, both will be good. Fruit has been damaged somewhat by late frosts or cold weather. Some think our wheat cannot make more than a half crop. J. T. M.

RED CLOUD, Webster Co., Neb.—Wheat has been damaged in the last ten days, but still the prospect is good for an average crop. Corn is in first-rate condition—a good stand, with an increase of acreage of about 25 per cent. over last year. Potatoes are looking well. Only a small amount of fruit is yet grown in this section, but enough to establish the fact that it can be grown successfully here. The prospects for good crops are better than a year ago. E. H. J.

JUNCTION CITY, Davis Co., Kan.,—It was thought in early spring that winter wheat, especially the late sown, would be an almost total failure on account of the prolonged drought. The rains of April and May saved it from that, however, though the crop will be light. Harvest has begun. It is estimated that the early sown wheat will yield from twelve to fifteen bushels per acre. Spring wheat will also be a light crop. So will oats. Corn promises well. Potatoes are good. Fruit of most kinds will be scarce. Peaches, of which there was a superabundance last year, were winter-killed to a great extent, though in some localities it is claimed the damage done is not so severe. Apples are not grown here as much as they might be, it would seem, for wherever the trees are planted they appear to do well. A.E.S.

SMITH CENTRE, Smith Co., Kan.,—We have a fine prospect for corn, wheat and potatoes; also for fruit. The cultivation of this, however, is rather limited owing to the newness of our country; but as far as tested it is evident that we have a good fruit country, and farmers are in good spirits L. C. U.

EUREKA, Greenwood Co., Kan.,—Wheat is now being harvested in this section and the weather being dry and fine, it goes up in good shape. The yield will be large, some yields will probably average as high as 35 bushels to the acre with a probable average of 18 or 20 bushels to the acre generally. Corn is in excellent condition. A good stand has been uniformly attained and the season has been exceptionally fine. The prospect for a heavy yield is at the present time good. The yield of early potatoes will not be large. The late ones promise well. Fruit prospects are fair except peaches, which were generally killed by late frosts. J. W. K.

PHILLIPSBURG, Phillips Co., Kan.,—Winter wheat in this county is about 65 per cent of an average crop; spring wheat, 50 per cent; corn, 100 and potatoes 100. This being a new county we have no fruit of consequence. F. S.

JEWELL CENTER, Jewel Co., Kan.—The wheat prospect is below the average—acreage large. The The corn prospect is at present good. Potatoes are good. Peaches and small fruits, the only kind we yet have, are good also. J. T.

ASHERVILLE, Mitchell Co., Kan.—The prospect here for fall wheat is good; spring wheat will be a short crop—unless we have rain soon, it will be nearly a failure. Corn and potatoes are looking nicely. The fruit prospects were never better in this locality. M. S. C.

WICHITA, Sedgwick Co., Kansas.—Prospects for wheat, corn, potatoes and fruit, are good. W. P. S.

WELLSVILLE, Montgomery Co., Mo.,—The prospects for good crops are very encouraging, except for hay and oats, which owing to dry weather all spring (broken now by fine rains) will be only half crops. Wheat looks well and is heading finely. Corn promises well, is very free from weeds and growing fast. Potatoes are nearly ready for use, and free from bugs. Fruit is mostly winter-killed, except apples and grapes, which seem to promise to be quite a fair yield. The outlook for us is very encouraging, recent rains have dispelled all fears for the corn crop—our main crop at present M. A. E.

BUCKLIN, Linn Co., Mo.—There was no rain in this vicinity, to do any good, through April or May. Grass, oats, and spring wheat are very poor. Winter wheat and rye are good—now ripe. Peaches were all killed by the past hard winter. Apples are below an average crop. Grapes promise well. Corn—our principal crop—never looked better; an immense acreage has been planted. If the seasonable rains we are now having continue, we shall harvest one of the largest crops of corn known. Potatoes are looking fair; but little tobacco has been planted. F. M. B.

LONGMONT, Boulder Co., Colo.—The outlook for the wheat crop in this section is on an average equal to last year's, where water can be obtained for irrigating purposes. Where this cannot be had the wheat is burning up. Early corn looks well, late, is taken by cut-worms. Potatoes do well in the mountains; in the valleys it is too warm for them. The season is somewhat later than common. Wheat, as a general thing, is just commencing to head. Fruit in this country as yet is a limited product, though it promises to do well in future. Vegetables of all kinds look well now, and grow in abundance in this country. A. M. A.

AUGUSTA, Woodruff Co., Ark.—The early part of the growing season was wet, throwing farmers in the grass, but at this date crops are clean and looking vigorous. Woodruff county *never* fails in a corn crop. Wheat and other small grains are raised to a limited extent only and for home consumption; this is not, strictly speaking, a wheat county—the soil is too heavy. Early potatoes were a complete failure, the vines being literally stripped of every vestige of foliage and the potatoes small and few. We use Early Rose or Early Goodrich for early and Peach Blow for late. Late frosts have ruined the fruit crop. Of 15 peach and other fruit trees on my place only two peach trees, directly against the house on the south, have any fruit. S. L. D.

VAN BUREN, Crawford Co., Ark.—Wheat will yield a fair average crop, in excellent condition and of fair quality. Corn looks promising. Potatoes, Irish, suffer for want of rains—Sweet, are in good condition. Fruits of all kinds are a good average, as now promised. In fact, all crops are fair to good in this section. Cotton was never better. Hay short, for want of early rains. L. C. W.

CLEVELAND, Bradley Co. — We are now in the midst of wheat harvest. The crop is above an average one. Corn is very small, but in fine condition, and a good crop is looked for. The continued drought has caused an entire failure in the potato and spring oat crops. Winter oats were badly frozen, and about one-third of what we have left is cheat. Fruit of all kinds, a failure—all killed in April. J. H. P.

WAVERLY, Humphrey's Co., Tenn.—Wheat in this section is below an average as to stand and acreage, but the quality is unusually good. The corn prospects are good for better than an average crop. The potato crop promises well. The fruit crop is a failure, generally speaking, and the quality of what little there is, is inferior. Business here is cheerful. J. W. S.

MURFREESBORO, Rutherford Co., Tenn.,—The crops in this section are generally good for the season. Wheat is now about ready to harvest. Corn is looking blue. Very few potatoes are raised here for shipment. There is no fruit of any consequence. Our principal crop for sale is cotton, we have good stands, all worked out, and in fair condition. F. H.

VANDERBILT, Unicoi Co., Tenn.—Wheat in this section will be light, on account of dry weather and rust. Corn looks well. Potatoes are good, especially the late planted. Peaches are good on uplands; all lowland fruit was killed by a late frost. Apples are falling badly. Small fruits are good. J. B.

FERN CREEK, Jefferson Co., Ky.—Corn is not up to an average in quality, but is about an average in acreage. The grain of wheat is good, but the growth is not so rank on the ground as last year. The quantity of potatoes put in is about as usual, and the prospects since last rains are fair for a good crop. Peaches are a failure. Apples, pears and cherries are average crops, but the fruit is not good. Some very hard wind, rain and hail storms have passed over and done a great deal of damage to wheat and young corn. W. C. A.

BENNETT'S MILL, Montgomery Co., Va.,—The wheat in this section can't make a half crop; some say not more than one-third. Corn is looking fine and bids fair to be a good crop. Oats are very short and will not be a full crop. Potatoes are looking well and promise to turn out well. Fruits of all kinds are a failure in this section. In May we had a frost that killed almost all fruit. Grass for mowing is short; we shall have but a small crop of hay. M. D. B.

FRANKLIN, Pendleton Co., W. Va.—The prospects for crops are very unpromising. There has not been rain sufficient to wet the ground since the 1st of April. Of course, all vegetation is suffering. Late in May and on the 1st of June there was a succession of freezing nights and some frosts, that destroyed nearly all the fruit of every kind. W. M'C.

HENDERSON, Granville Co., N. C.—The wheat harvest has just commenced. The crop, on the whole, will be inferior to last season's, a vast amount of rust and blight being prevalent. Where, however, good culture has been given with about 40 bushels of cotton-seeds to the acre as manure, the wheat is very fine in all respects, and promises from 20 to 30 bushels to the acre. About the same may be said of that grown on land in tobacco last season, whilst that grown in the but too often careless North Carolina fashion, will not turn out more than from three to five bushels to the acre, and most of it will not pay for harvesting at all. Oats will be a thin and short crop, the season, on the whole, having been too dry for that cereal. Rye and barley are but little cultivated around here. Both look promising where grown. Corn and cotton promise well, and the late small rise in the price of the latter has stimulated a much greater degree of culture than was given to it last season. Tobacco, Golden Leaf, is at present becoming the all-absorbing crop wherever plots of land are suitable for it, and many persons are realizing handsome returns. Henderson, its market center, is fast becoming a big town of fine and and rather colossal tobacco warehouses and factories. Granville Golden Leaf Tobacco, through London chemical analytical reports, is becoming celebrated as about the best in the world, and often brings at the auction rooms from one to two dollars per pound, and from 15 to 20 thousand dollars' worth is often sold daily in the season. Chufas are attracting considerable attention, and promise to be a valuable crop, especially in conjunction with the falling fruits of the large English Black Mulberry, for the fattening of swine at a cheap rate. Silk worm and silk raising are new industries here. Not far from here is commenced the planting of White Mulberry trees for raising worms for the French and other markets, and so far, the thing has proved very successful and profitable, and the near future will, no doubt, see North Carolina a silk-raising and manufacturing State. China Tea is also commencing to be successfully grown, and in quality it is equal to that of the Celestials, and it only remains for some kind of machinery to be invented for picking it, to render it an industry of no mean importance. Although in the spring there was never a better prospect for an abundance of every fruit grown here, yet it may now be said, upon the whole, that with the exceptions of the promised abundant yield of grapes, all other kinds of fruit are complete failures. Apples and pears were fully expected to be a fine crop, from their having escaped frosts disastrous to all other fruits on the 3d and 4th of April; but mildew and insects have totally ruined them. In some places contiguous to this, the peach crop, either wholly or partially, escaped the aforementioned frost; but the curculioes have already destroyed about two-thirds in those sections, and I think but few marketable peaches will be found in North Carolina this season. From some portions of the eastern sections of this State, and especially around Albemarle Sound, where it appears from recent experiments peaches never are hurt by frosts or insects, some fine specimens of early peaches will most likely grace the northern market. H. S.

BROOKSTON, Warren Co., North Carolina.—Taking 10 as the average of last year's crop, the prospects for 1879 are about as follows:

	Acreage.	Present Condition.
Wheat	9	9
Oats, winter	10	6
" spring	10	9
Corn	10	12
Cotton	12	12
Tobacco	12	10
Rye	10	10
Potatoes, Irish	10	7
Grapes	10	13
Peaches	10	1
Farmers' Gardens	10	10

We have had it pretty dry in this immediate vicinity, but are having a fine rain to-night. We have had no heavy beating rains this spring, consequently cotton came up firmly. The rise in price will encourage planters to give it thorough cultivation, though just now labor is not abundant, and probably some have planted more than they can properly manage, unless the weather proves particularly favorable for the destruction of grass. The wheat harvest has commenced. Oats are in full head. Early Rose potatoes are nearly ripe. Corn is in all stages from six inches to four feet high. M. B. P.

MEZULA PLANTATION, Aiken, South Carolina.—Wheat, corn and potatoes are good in this section. The prospect for fruit is very bad. Peaches were cut off by late frosts. All small grains are good. The prospects for cotton are also excellent. J. F. M'L.

STARKE Co., Fla.—It seems so odd to read that with you Pearl Millet is just appearing above the ground, and that watermelons are only putting out the second leaves, while we have Pearl Millet eight feet high, with heads of seed 15 inches in length. One bunch which we transplanted has 31 large stocks, all from one seed. We have Iceland watermelons measuring 23 inches around. Voorhis are about half as large; the latter, however, we planted considerably later, as we did not receive the seed in time to plant as early. Our Blunt corn is, some of it, badly injured by the drought. We have some of the native corn, with stocks 11 feet high, all tasseled and silked. The Blunt corn, being planted later, did not get as good a start before it became so dry, and therefore could not stand the drought as well. The Acme tomatoes are doing finely; the vines are full of large tomatoes, which are looking much better than General Grants. They have both had the same care and cultivation. I have them trained on trellises, and think it the best way I have ever tried, to keep them from the ground. We have not watered them at all, as our flower garden, tea plants, newly-set trees and the choice cuttings we are starting are all we felt able to water, especially as we had no other way of doing it than with a common garden watering pot; and as we have not had a drop of rain for over a month until yesterday, the 7th, we must have had hard work to keep some things alive, to say nothing about their growing; but, by dint of shading from the hot sun through the day, with a sprinkling and the dews at night, we have kept things looking remarkably well. In many gardens about here everything is completely dried up. One man has ten acres of corn, which is entirely spoiled. Our rice has suffered more than anything we have; some of it has all died down, but we are in hopes it will come up from the roots again. Neither sugar cane nor cotton are hurt at all, we think. There are many families here who came from the North last year with so little means that they have had a very hard time so far, and if their crops fail them this year they will be utterly discouraged. I. S.

COURTNEY, Grimes Co., Texas.—This section is a cotton and corn country, though fruit, such as Peaches and Grapes grow here in abundance, but we have no market for them. Potatoes are nearly a failure this year; but for five years back we have had fine crops; the yield is, say, 15 barrels to one barrel planted. We have had no rain for 2½ months yet, cotton is fine. Corn may suffer a little unless it rains soon. W. W.

SAN ANTONIO, Bexar Co., Texas.—Owing to the long-continued drought all our crops are cut at least one-third. The fruit product amounts to nothing. Wheat is a little better, and oats are on a par with the other things. We have had only one rain since May 22nd. Corn looks *so-so*. I. E. L.

CANTON, Madison Co., Miss.—This county imports more than one-half of all the grain that is consumed; everything is subordinated to cotton, and cotton alone. There are probably not 50 acres of wheat sown in the county. Of oats there is a little—now being harvested. More corn has been planted than usual this season, which has been very favorable, thus far, for both these crops. Potatoes, in family gardens and for home consumption, are unusually fine, but there are none for export—if there were, the railroads would not permit the trade. J. J. O.

HOUSTON, Chickesaw Co.—The wheat crop is very good for this county, averages from eight to 12 bushels per acres—not a great deal sowed. The

corn prospect at this time is very good; rather too much rain; more planted than last year. The potato prospect is good. As for fruit, there is none—the frost killed it. In a county below, adjoining this, there will be a good crop of fruit.

T. S. P.

EXHIBITION OF NEW YORK HORTICULTURAL SOCIETY.

THE annual summer exhibition of New York State Horticultural Society was held at Union Square Garden on the 11th, 12th and 13th inst. There were in all about 150 exhibitors, among whom were distributed nearly $2,000 in 200 premiums. One of the most attractive features of the exhibition was a large Pitcher Plant (Nepenthes Hookerii), sent by John S. Bush, of Tremont, N. Y. It measured about two feet in hight, three feet in diameter, and had 37 large pitchers. The same exhibitor had also a very fine collection of stove and greenhouse plants, among which were several beautiful Crotons, Caladiums Palms, two graceful Aralias—Veitchii and elegantissima—and many others.

Parsons' Sons' Company, of Flushing, L. I., had a collection of 25 Japanese Maples in as many varieties, a collection that is unequaled by any other plant growers in the country. They had also a fine collection of 50 Conifers, in which were all the most elegant and comparatively new varieties. The same firm took first premiums for the best new plant never before exhibited in this country—a Stuartia Japonica. It is a hardy shrub with two-ranked, entire leaves and white flowers.

Mr. Peter Henderson had a large collection of Strawberries and greenhouse plants. A beautiful exhibition of cut Roses was sent by A. DeJonge, an amateur of Staten Island. Wm. Bennet, of Flatbush, Long Island, took first premium for his exhibit of stove and greenhouse plants. Among the Orchids were especially noticeable some very handsome Cattleyas and the beautiful, sweet-scented Aerides odoratum.

The Palms were well represented by a collection from Isaac Buchanan, and Ferns by F. Rosenbeck of Bayonne, N. J. Besides this, there were a large number of floral designs, baskets and bouquets, by various exhibitors. The exhibition was mostly floral. Very few vegetables were to be seen. Of forced fruits, there were some fine clusters of grapes and two varieties of peaches—Jaques' yellow Rareripe and Golden Dwarf.

As a whole, the exhibition was creditable to the Society, though it was patronized by fewer visitors than usual. We would like to see amateurs and our numerous smaller nurserymen take a greater interest in the proceedings of the Society. There seems to be a lack of enthusiasm on their part, which must prove a serious impediment to the progress of horticulture. All the collections that attracted special attention were by our large, well-known firms, who sent them out of their abundance.

Be sure you get the Genuine Murray & Lanman's Florida Water. There are counterfeits, but if you will hold a leaf of the pamphlet which is around each bottle, up to the light, you will see in faint letters, water marked in the paper, the words "LANMAN & KEMP, NEW YORK," and where you cannot find this, you may be sure the article is not genuine.

Robust and blooming health in Hop Bitters, and no family can afford to be without them.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 14th, 1879.

BEANS AND PEAS.—Beans are dull, trade hardly up to the usual small requirements of the season; in fact, all but medium and marrow are simply nominal. Many parcels of stored stock begin to show the effects of hot weather. This fact tends to check liberal purchases. Peas unchanged; green, ₱ bu, $1.80@1.85; B. E. peas, per 2 bush. bag, $2.50; Canadian, in bulk and bond, 75c., as a small selling price. Beans, mediums, prime, $1.30@1.32½; fair to good, $1.20@1.25; marrows, prime, $1.35@1.37½; fair to good, $1.20@1.35; pea, $1.20@1.35; white kidney, $1.30@1.50; do., red, $2.80@3; turtle soup, $2.15@2.20.

Receipts of beans for week, 2,452 bush.; exports, 486 pkgs.

BEESWAX.—Dealings are limited to small lots, with Western quoted at 24c. and Southern at 24@24½c.

Exports for week, 1,100 lbs.

BUTTER.—Receipts for June were never before so heavy; 46,350 pkgs. this week and 45,500 last week. Exporters have taken 16,000 pkgs.; but even with that liberal business the surplus is large for local and other wants. All sections are sending good, even grade, right in hot weather; we find grocers running upon tubs in preference to pails, while creamery as well is quoted unusually close to other fine make. The bother of returning empty pails and large creamery pails, is becoming more and more an objection in the trade in them Prices, as a rule, lower all through; though the decline is not so marked in Western as in State, as the former was down to the most popular rates before. Tone of the market at the close very easy. Firkins quotable this week.

State pails and half tubs, choice, 13½@14c.; good to prime, 12@13c.; fair to good, 11@12c.; firkins, choice yellow, 15c.; fair to good, 13@14c.; Welsh tubs, choice, 13½c.; good to prime, 12@13c.; fair to good, 11@12c.; poor, 9@10c.; State creamery, best invoices, 15c.; good to prime, 13@15½c.; sweet cream, best, 15@15½c.; fair to good, 14@15c.; Western, best invoices, 15c.; good to prime, 13@15½c.; fair to good, 12@13½c.; imitation creamery, 11@13c.; Western dairy, best invoices, 12@13½c.; good to prime, 11@12c.; fair to good, 10@11c.; poor to fair, 8@9c.; Western, factory, best invoices, 11c.; good to prime, 10@10½c.; fair to good, 9@10c.; poor to fair, 7@9c.; grease butter, 4@4½c.

CHEESE.—This has been a severe week for this trade. The English advices have been discouraging to shippers, and they have not been willing to operate extensively, notwithstanding prices were put down. Receivers have been anxious to dispose of the early made stock, especially as next week's arrivals will probably be of better quality, but they are forced to carry over a good deal. For the choicest factories 7 and 7½c. were made early in the week, but at the close 6¾c. is a more general rate for the choicest colored—now and then a parcel reaching 7c.—while for the best of the white it is difficult to exceed 6¾c. Leaving these best lots it is difficult to fix upon values, as it has been necessary to take anything like a reasonable bid. The next grade to fancy is not above 6c., and very good qualities can be had decidedly under.

Quotations are for new factory: 6¾@7c. for best; 5½@6c. for good; 4½@5¾c. for fair to good; 3½@4½c. for half skimmed, and 1@3c. for skimmed; dairy at 6@6¾c. for good and fine; 5@6c. for fair to good, and 1@3c. for skimmed; Western factory at 6¾@6¾c. for fine; 3@4c. for half skimmed, and 1@3c. for skimmed.

Liverpool quotation, 59s., which is a decline. Steam, 35s.

COTTON—Has been subjected to sharp fluctuations through speculation, but closed weak at for June, 12.78c.; July, 12.78@12.79c.; August, 12.84@12.95c.; September, 12.52@12.53c.; October, 11.62@11.63c.; November, 11.22@11.24c.; December, 11.12@11.14c.; January, 11.14@11.16c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

DRIED FRUITS.—Evaporated apples have had a good sale and are a little higher; beyond this trade drags and the situation is a nominal one.

Apples—evaporated Alden's & William's 10½@11c.; do. new process at 8½@9c. State plums, 11c.; Blackberries quoted at 4½c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2½@3c. Pitted cherries, 20c. Apples—New, 2½@2½c. for Southern quarters in bags; 3½@4c. for prime sliced; do., fair and good, 3@3½c.; State at 3@3½c. for new sliced; and 3@3½c. for quarters; Western at 3@3½c. for new quarters. Raspberries, 30c.

Exports for week, 363 bbls. apples.

EGGS.—Receipts for week, 10,070 bbls.; do., last week, 11,378 do. Prices have ruled quite steady during the week, supplies not oppressive. Sellers divide losses in count on Western when full prices are paid.

Near points, 15c.@15½c.; State, Penn., and Canadian, 13@13½c.; best Western, 13c.; second quality, 12@12½c.

FRESH FRUITS.—Russet apples winding up for selected at $2@2.75; Strawberries abundant and have been very low all the week. Trade not as active as it should be. Dealers say that a cheap market is the worst for them to move stuff in. Some extra highly cultivated sorts are in, and have sold at big prices. Great American, Downing's Beauty, brought 50@75c. qt. The market quotations are up-river, 10@12c. qt.; L. I. and S. I., 7@8c.; N. J., good to prime, 5@7c.; poor, 3@4c.; hulled, pints, 3@5c.; do., half pint baskets ₱ hundred, $1@2; Maryland and Delaware, of not much account now, have sold at 3@5c. ₱ quart. Cherries, still of low quality, quoted at 10@15c. ₱ lb, choice table; common, 4@6c. Gooseberries quiet at $1.25@1.50 bush. Small green Georgia Peaches scarce. Charleston supplies the few wanted at $1@2 ₱ bu. bush. North Carolina will ship next week. Black Hamburg and Muscat Grapes, hot-house, 75@$1 lb.; sweet water, 40@50c. Peanuts are active with prices well supported. There is some speculative demand, but a good many bags have gone into use. Va. hand-picked, $1.40@$1.45; other, $1.20@$1.35; shelled, 5½@5¾c.; Pecanas, 6@8c.

FLOUR.—The market has become quite active, trade well distributed to exporters and home trade buyers and rather better prices made.

The quotations are: $3.35@3.80 for inferior to very choice superfine State; $3.75@4.10 for poor to good extra do., odd lots and lines; $4.10@4.65 for good to choice do.; $3.35@3.80 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.75@4.10 for inferior to good shipping extra do., and $4.10@4.35 for good to choice extra do.; common to about choice white wheat extras, $4.50@5.65; choice to very fancy do. at $5.75@6.75; red and amber winter wheat, inferior to very choice trade and family, at $4.45@5.00; round hoop Ohio at $4.10@4.40, and trade and family brands of do. at $4.60@6.25, the latter rate for fancy; St. Louis, $4.50@5.65 for inferior to good extra; $5.50@6.50 for good to very choice (with fancy brands up to $6.75); Minnesota clear, inferior to fancy, at $3.80@5.00; Minnesota "straight," very inferior to strictly choice, $4.60@6.00 (a few fancy as high as $6@6.25), and patent poor to strictly fancy at $5.25@6.75, few brands going above $7.50; unsound stock at from $2.25@5.00; city mill extra at $5@5.25, about fair to choice, for West Indies strictly fancy in new packages held higher); do. for England, $3.70@4; do. trade and family extras, $5.25@6.25; do. for South America, $5.50@5.65 for standard brands (winter wheat product); No. 3 at $2.35@3.25 for poor to strictly fancy.

GRAIN.—Wheat has shown much more general activity, the wants of exporters have increased through improved foreign accounts; prices are higher and strong.

Latest sales are of No. 2 spring at $1.05@1.06; No. 3 spring at 92@94½c.; No. 4 spring at 85c.; rejected spring at 75@76c.; ungraded spring at 85c.@$1.03; mixed winter at $1.16½; ungraded amber at $1.15@$1.16½; No. 2 amber at $1.16; ungraded red at $1.10@1.18; No. 1 red at $1.18½@$1.19; No. 2 red at $1.18@1.18; No. 3 red at $1.14½; ungraded white at $1.06@$1.15½; extra white at $1.17½; No. 1 white at $1.17; do. steamer at $1.15; No. 2 white at $1.14½; New York No. 2 spring, July, at $1.05; No. 2 red, June, at $1.18½; do., July, at $1.16; do., August, at $1.12; do., September, at $1.11; No. 1 white, June, at $1.16½; do., July, at $1.15½. Rye at 60½@62c for Western, and 65c. for State and Canada. Corn has been more freely offered at a decline; sales of New York No. 2 at 43½@43¾c.; No. 3 at 40½@41c.; steamer mixed at 42½c.@43½c.; ungraded Western mixed at 38@44c.; No. 2 white at 50@50½c.; New York steamer white at 46¼@57c.; low mixed at 47½c.; New York yellow at 45@45½c.; yellow Western at 45½c.; white do. at 48c.; New York steamer yellow at 43@43½c.; New York No. 2, June, at 43½@43¾c.; do., July, at 44½c.; do., August, 45½c.; do., September, at 46½c.; steamer mixed, June, at 43c.; do., July, at 43c.; do., August, at 44½c. Oats after showing unusual activity and much higher prices, based upon the prospects of the crop, have at the close reached a little; sales of New York No. 1 at 39½c.; New York No. 1 white at 43c.; No. 2 at 38¾@39½c.; do., July, at 39c.; New York, No. 2 at 39½@39½c.; New York No. 3 at 37½c.; New York No. 3 white at 38½c.; No. 2 Chicago at 38½c.; and do. afloat at 39½@40c.; mixed Western at 37½@39½c.; white do. at 39½@43½c.; white State at 42@43½c.

HIGHWINES—Are wanted, and $1.07½ offered, with $1.08 asked.

HAY AND STRAW.—The better qualities of hay are plenty and easy in price, while shipping grades are wanted, and hold at very regular prices.

Sales at 40@45c. for shipping, and 70@80c. for prime retail qualities. Straw at 45@55c. for long rye; 45c. for short rye, and oat at 30@40c.

Exports for week, 675 bales.

HOPS.—Emmet Wells in his circular says: "Trade has quieted down considerably this week. Exporters have taken only 223 bales, while brewers have bought probably enough more to bring it up to a thousand bales. Our reports from the hop districts are anything but encouraging. The slow growth of the vine seems to be more the result of neglect of proper care and cultivation than anything else. Should the price open and rule high next fall, growers who are now neglecting their yards will regret it. It is a great mistake to let hop yards run wild and give them no care in times of low prices and depressed markets better abandon the business at once and try something else than raise poor hops. We are likely to be exporters to Europe for some years to come, but we must produce a better article if we wish to compete with Kent and Sussex growers in quality and price."

Quotations are for New York's new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 3@9; Yearlings, 2@4; Olds, all growths, 1@2; Pacific coast nominal, 8@10.

OIL-CAKE—Is scarce and wanted at $29.50 per ton.

PROVISIONS.—Hog products have tended higher with increased export dealings. Mess pork quoted for June, $10.15 bid and $10.25 asked; July at $10.20 bid and $10.25 asked, and August at $10.30@10.35; September at $10.40 bid and 10.45 asked. Bacon at $5.12½ for long clear and 5.38 for short clear. Lard—Western steam, at $6.45 for spot lots, $6.45 for June; $6.50@6.52½ for July, and $6.57½ for August. Stearine at 7c. for choice. Tallow at 5 15-16c. for prime. Beef hams at $17.75@17.50. Beef—Extra India mess, $17.50@20, as to quality; packet, $11@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

POULTRY AND GAME.—Prices are lower for the whole list of live; chickens have a better demand, owing to the scant game market.

Chickens, large, per lb., 24@25c.; small, 20@22c.; fowls, N. J., 10c.; Western, 8½@9c.; Southern, 8@8½c.; roosters, old, 4@5c.; turkeys, 8@9c.; ducks, N. J., N. Y. and Pa., ₱ pair, 60@70c.; Western, 35@45c.; Southern, 30@35c. Geese, Jersey, $1.25@1.50. N. Y. and Pa., $1.25@1.50; Western, 87c.@$1.12; Southern, 75@87c.; pigeons, 40@45c.

Dressed poultry from the country has a risky market at this season. Choice parcels quoted as follows:

Turkeys, prime, small, 16@18c; fair to good large, 10@11c.; chickens, spring, Phila. dry-picked, 30@35c.; State and Western, 20@25c.; fowls, Jersey, choice, per lb., 11@12c.; State and Western, dry-picked, 10@11c.; do. do., scalded, 8@10c.; Phila. dry-picked, 12@13c.; ducks, spring, Phila. dry-picked, 30c.

The offering of game is small: Eng. Snipe, ice-house, doz., $2; plover, $1.75@2; Dowitch snipe, $1.20@1.50; prime wild pigeons, $1.75; frogs' hind-quarters, ₱ lb., 15@20c., tame squabs, $1.75@2.

SEED-GRASS—Is dull; Clover quoted at 6½@7c. timothy is scarce and would bring high prices.

TOBACCO.—The export demand is still slack, but there is a fair home trade inquiry, which is sufficient to keep prices very regular.

VEGETABLES.—For old potatoes $2@2.50 is now a full range, good, useful and choice only selling. New potatoes have declined. Norfolk now sends supplies that control prices to some degree. Bermuda, $5; Chas. and Sav., $3@4; Norfolk, $3@3.50; Md., $2.50@3; culls, $1 1.50. New Jersey peas will have a short crop; Long Island sends plenty. Cucumbers, Sav. and Cha., ₱ crate, $1.75@2.25; beans, Norfolk, round, ₱ ½ bbl. box, $1@1.25; flat, 75c.@$1; N. C., 50c.@$1; green peas, L. I., ₱ bag, 87c.@$1.12; asparagus, Oyster Bay, ₱ doz., $1.25@1.50; Shrewsbury, $1; tomatoes, Sav., ₱ bu. crate, $1.50@2; Fla., choice, $1.75@2.75; prime to fair, $1.25@1.50; Bermuda, ₱ box, 25@35c.; radishes, near-by, ₱ 100 bunches, 25@75c.; lettuce, ₱ bbl., 50@75c.; cabbage, Norfolk, $1.25@1.50; rhubarb, ₱ 100 bunches, $1@1.50; onions, Bermuda, ₱ crate, $1.25; beets, N. J., ₱ 100 bunches, $2.50@3; turnips, N. J., new, ₱ 100 bunches, $2@3.

WOOL.—The new clips are being marketed as promptly as possible to take advantage of the continued excitement and the consequent high rates. The Ohio growers are getting 33@38c., and they find quick buying at those figures. Such of the Western clips as have appeared here have been taken up close, and although the arrivals generally are much larger, there is no difficulty in keeping the market clear from accumulations. Sales here of XX Pennsylvania at 36½c.; spring, California, at 21@27c.; do., Texas, at 24@30c.

LIVE STOCK MARKETS

NEW YORK, Saturday, June 14th.

BEEVES.—Receipts for the week, 10,631 head; do., last week, 9,702 do. The market demand has fallen to its former limit and the stock yards feel the effect of diminished trade at the stalls. There was a fair demand at the close, especially for good corn-fed steers, and butchers generally rated the market as about the same as on Wednesday, but the pressure of wholesale slaughterers for lower prices was persistent, and closing rates on ordinary and medium steers were certainly $1 per head off from closing figures of last Wednesday. Some old dry cows and thin Texas steers went down to 7½c. per lb., to dress 54 lb @ 55 lb to the gross cwt., and a pair of extra steers reached the high mark of 10½c., to dress 57 lb. Aside from these exceptional sales the extreme range was 8½@10c. ₱ lb, to dress 55 lb @ 57 lb. Nearly 200 were taken for the export trade at 9¾c.@10c., to dress 56 lb @ 57 lb.

SHEEP AND LAMBS.—Receipts for week, 25,831 head; do. last week, 23,738 do. Sheep steady; lambs easy. Sheep 4@5¾c.; lambs 4¾@6¾c. for Southern and Western; 7@8¼c. for Md., Del., and N. J. stock.

COWS AND CALVES.—There is no regular demand. A few sales in lots quoted at the old range of $30@50; $60 occasionally obtained.

VEAL CALVES.—Choice N. J. milk fed calves scarce and firm. A good line of State calves have been brought in, selling mainly at 4½@5c.; best State 5¼c.; do., N. J., 5½@6c.; good N. J., 5c.; poor 4@4¼c.; buttermilk, 2½@3c.

HOGS.—Receipts for week, 26,693 head; do last week, 29,971 do. Fair to good corn hogs quoted at $4@4.20 ₱ 100 lbs.

City-dressed State light, 6c.; heavy to medium, 5@5¾c.; do., Western, 5¾@5¾c.

DAIRY SUPPLY COMP'Y,

261 and 263 Greenwich St.,
P. O. Box 416. NEW YORK.

We are now prepared to furnish Milk and Butter Dairies, and the Trade, with the best as well as the newest implements and apparatus adapted to their needs, especially—

MILK-PAILS.—First among which is our own "Perfect Milk-Pail,"—stool, strainer and pail in one—combining the highest degree of cleanliness and purity of flavor in the milk, and convenience in use, excluding the air of the stable, with odors of the cow and of the milker.

MILK and CREAM-TESTING APPARATUS, Test Tubes, Graduated Tubes and Foot Glasses, Lactometers, Thermometers.

MILK-SETTING APPARATUS of the most approved kinds, viz.: Top-Cooling, Refrigerating, Covered, Ventilating, Creamery Pans, Cooley Creamers, Cooler Pails, Ventilating Submerged Pails, Glass, Earthen and Tin Pans, etc.

BOTTLE AND GLASS JARS, for *individual* delivery; especially the new Warren Bottle, the most perfect ever devised for either milk or cream.

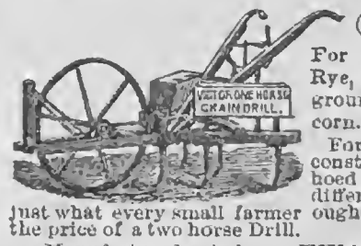
CHURNS—especially our own Pendulum or Monitor Churn oscillating, upon cords from the ceiling. The easiest working and most perfect churn, in all respects, made, especially for granular butter and the brining process.

BUTTER MOLDS, Prints, Presses, etc., particularly the Nesbit, which gives great satisfaction,

BUTTER PACKAGES, large and small, for Lump Butter, Gilt-edge, etc., with or without ice chambers.

Circulars upon application.

"Victor" one-horse Wheat Drills

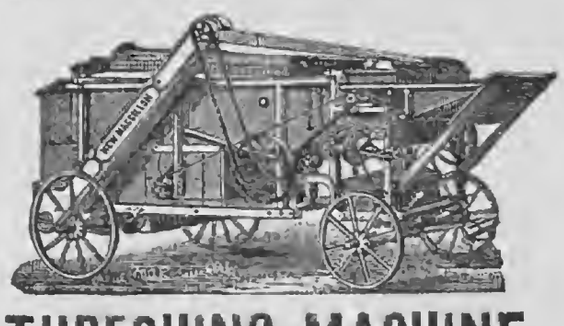


(3 and 5 hoed,)
For Sowing Wheat, Rye, Barley, in fallow ground or in standing corn.

Force feed; simply constructed. The five hoed is adjustable for different widths, and is just what every small farmer ought to have, saving the price of a two horse Drill.

Manufactured only by EWALD OVER.
[Send for circulars.] Indianapolis, Ind.

The "New Massilon"



THRESHING MACHINE
Beats the World!

SEE WHAT PEOPLE SAY OF IT:

From G. P. Nelson and others of Beaver Creek, Rock Co., Minn.—We have run the "New Massilon" No. 6, bought of you at Sioux Falls, four weeks, and like it better than any we have ever used. We have run all the leading machines for fourteen years, but the "New Massilon" beats anything we ever saw for lightness of draft and perfect operation in threshing, and for separating and cleaning wheat, oats, barley and flax it has no superior.

We are getting more threshing than we can possibly do. The farmers all want the "New Massilon."

4 Sizes, Capacity from 300 to 1,500 Bushels.
Illustrated Circulars, Price Lists, etc., free. Address
RUSSELL & CO., Massilon, Ohio,
Also Manufacturers of the Celebrated Massilon Portable and Russell's Improved Traction Threshing Engines.

AMY'S GARDEN.

HENRY S. CLUBB.

In her rambles about the woods that form the natural protection from the storms of Lake Michigan, Amy had found many varieties of flowers that she prized for their own intrinsic beauty and sweetness. She not only took a great interest in them as botanical specimens, but she valued them as pets just as her sister Jenny loved her pet animals. Although her herbarium contained many choice specimens dried, much of their beauty and nearly all their fragrance were gone after they were dried, so she concluded to transplant as many of her favorite flowers, mosses and evergreens from the woods to a little plot of ground which she selected on the north side of the farm-house for the purpose. There was a natural spring of water, which, running past her garden, gave her a chance to rear such of her pets as required a moist locality, while the shade from the house and some ornamental trees enabled her to rear those plants that had been accustomed to the shade of the woods

Amy had such an ardent love for these beautiful forest flowers that she took special pains to transplant them so as to injure their roots as little as possible, and she studied the nature and habit of each one by reference to her botany so that she placed them in just such a soil and situation as was adapted to their growth. In this way she succeeded in removing plants which are usually very difficult to make live away from their native forest or stream.

Near Amy's garden the stream from the spring above, widened out so as to form quite a little lake and it was Amy's ambition to have the white Pond Lily growing in that lake, so she induced John, her elder brother, to go with her one day in a boat, carrying with them a garden rake and a hatchet. When they rowed to a shallow portion of the river which empties into the great lake not far from their home, they found some Pond Lily roots and by means of the rake they raised a root to the surface of the water. It was very large and long. They could not get it all up as it reached a long way in the mud at the bottom, so when they had raised up a piece about six feet long, they chopped it off with the hatchet and then cut it into three pieces about two feet long each and carried them home, immediately throwing them into their little lake. They were soon delighted to see leaves floating on the surface, and the next summer there were about a dozen beautiful blossoms After that they had no further trouble. Every year they had an abundance of Pond Lilies growing at home.

In the pond near the centre there was a little island on which Amy had planted some of her choicest flowers and shrubs. Here was a clump of wintergreens which delighted her every summer with the pretty wax-like flowers and in winter and spring with red berries nestling so beautifully in the dark-green foliage. Near by was another clump of trailing Arbutus the flowers of which appeared in the early spring and continued several weeks. Violets also grew on the island in great profusion, and when the wind was north the fragrance of the Violets was wafted to the house. Around the shore of the island near the water Iris or Blue-flag, grew in great profusion, and when in blossom also sent forth a sweet odor. Among Amy's most cherished pets were the Lady-Slipper and the Columbine, both of which grew well on the island.

At one end of the little lake, where the water was shallow, Amy had planted the Pitcher-plant, and it grew well in the wet place selected for it. When her young friends came to see her she would gather the curious leaves of the Pitcher-plant to play with, as they very much resemble toy pitchers and would hold water quite as well.

On the north side of the pond Amy planted a dozen young Arbor-Vitæ trees from the forest, and they grew luxuriantly. In order to make them grow thick she had to shear them, cutting off the tips. In a few years after they were planted they had grown so thick that they broke the force of the northwest winds and made her little island garden much more secure from the storms.

For several years the only way to reach the island was by wading on stilts as the water was about two feet deep, but when the place began to look so pretty, as the shrubs and trees grew up, there were so many people that wanted to visit the island to see Amy's collection of living specimens, that John concluded to build a foot-bridge across at the narrowest part. He built a pretty rustic bridge of cedar trees with a rail on each side supported by cedar posts and cross-braces.

This little lake with its garden, island and bridge, its Pond Lilies, its wild flowers, ferns, and mosses at various points on its banks, and its overhanging trees, formed a very attractive spot, and being in sight from the highway was admired by all who passed by, and was the scene of many a joyful hour for Amy and her young friends and schoolmates who desired to pay her a visit.

Nothing delighted Amy more than to have a party of her companions assemble under one of the old forest trees within sight of her garden and have a nice talk about flowers. She never tired of telling them about the different species and showing them how to tell the name of a flower by dissecting it and referring to the botanical class-book. They often brought her flowers from the woods to test her ability, and were always surprised to see how quickly she could tell the family to which it belonged, and usually give its common and Latin name without a reference to the botany.

Amy, by these attractions of natural beauties which she thus cultivated and delighted to show to her friends, naturally became the center of a charmed circle. All the very best young people of the vicinity delighted to spend their leisure time in her pleasant home and garden. The influence and sweet companionship of flowers acted charmingly on her disposition, and gradually developed in her that sweetness and grace which delighted her friends. Without any direct effort at moral or religious instruction, her personal influence was such as to lead others unconsciously to themselves into the ways of Wisdom. And "her ways are ways of pleasantness, and all her paths are peace."

THAT PARTY OF TRAVELERS.

At long intervals after the suggestion of an imaginary voyage to Europe, I have received a few queries as to the cost of books, etc, which have shown me the impracticability of my little plan. Clearly the libraries of my young relatives are not as well stocked with reference books as they could wish; and, as nothing was more foreign to my intention than the desire that my young friends should incur any but a nominal expense in the purchase of a guide book or two, I fear, to prosecute our scheme would be paying too dear for the whistle. It was the consideration, of expense, I am now persuaded, that has deterred all but a few from subscribing to the plan. As it is, so few have expressed their willingness to go abroad this summer (in imagination) that I think it best to rest the matter right here, and see if some other expedient may not be devised for our amusement. I shrewdly suspect, moreover, that Uncle Mark has so surely engrossed you in the discussion and cultivation of parti-colored radishes and other rural and horticultural delights that your time during the summer will be fully occupied. There is such a poetic charm about the contemplation of a cabbage, and such real money to be extracted from the garden, as may well affect the moral and material sides of your natures; and to these pursuits, under your painstaking instructor, I commend you heartily. Later, when it will have become inconvenient to work out of doors, we will hit upon something attractive for the long winter evenings in which all may join. Meantime I shall, myself apply for a position in the "Club," as becomes a true uncle, or UNCLE TRUE.

A WISE DOG.

While we sometimes see men acting like brutes, we often see brutes showing intelligence almost human. Animal instinct as it is called seems closely akin to reason at times. A friend of mine Mrs. B. W. of Mt. U. had a fine intelligent dog, also a pet canary of which she was very fond. In caring for the bird, she left one of the seed cups ajar and the bird seizing the opportunity, turned the cup and made his escape. Many times during the day she exclaimed.

"My poor bird, my dear little bird. Oh, if I could only find my bird again."

Prince heard the words, wagging his tail as if to say, "I understand you."

Near nightfall, Mrs W. accompanied by her husband and the faithful dog walked toward a wooded ravine near the house and she again spoke of her lost bird. Prince looked up into her face and then bounded off returning with the lost bird which he laid at Mrs. W's feet. She screamed, thinking the bird dead when away it flew again. The dog followed and soon returned with a yellow and black wing protruding from his mouth. The bird he carried carefully in the hollow of his jaw, and again laid it at his mistress' feet. This time the bird seemed to be quite dead, and Mrs. W., after fondling it awhile, laid it in its cage. When she returned a short time after, the bird was hopping about merrily from perch to perch, while Prince was seated as quietly as though entirely unconscious that he had done any thing at all remarkable. Yet his achievement proves that dogs understand language though they cannot talk. How he caught the bird remains a puzzle. MRS. E. J. RICHMOND.

UNCLE TRUE JOINS THE CLUB.

Pleasure and pain mingle strangely at the contemplation of the article Uncle True sent me for this week's issue; pleasure at the honor conferred upon the Horticultural Club in permitting it to count so venerable and distinguished a personage as Uncle True among its members, and pain at the abandonment of his projected imaginary voyage. I had no small thought of joining the party also, and anticipated a great deal of instruction and amusement from the trip. But in this case, all the enjoyment proved to be in the anticipation and none whatever in participation. Uncle True has concluded to remain at home, and he apprises us of his desire to join the Club. He is as welcome as he is unexpected. There is a poetic charm in the cultivation of plants and rural pursuits, which I fear he has not been aware of until lately, and as yet, his tastes in that direction are very crude. Of all plants, he seems to find the greatest expression of beauty in that humble but useful species of the cruciferæ, the cabbage, probably caused by his love for sauerkraut. But, young horticulturists, let us show him his mistake, and point out to him real beauties of the floral tribe that will send a thrill of ecstacy through his kind, old heart, and awaken a love for horticulture that, though it comes late in life, may still be a source of enjoyment to him through the rest of his years.

UNCLE MARK.

LETTERS FROM BOYS AND GIRLS.

UNCLE MARK AND COUSINS:—My sister and I wish to join the Horticultural Club, if we are not too late.

We have never had a vegetable garden, but Anna has a number of house plants, and I have cultivated a few flowers. Last season I had a bed containing the plants, the seeds of which I got from the RURAL'S Free Seed Distribution, and Pansies, Phlox, Balsams and Asters. This summer I have a bed for the seeds we received this year, and some others, and the last year's bed for self-sowing sorts. I have set out a number of currant slips, but only about half of them lived on account of the lack of rain. How can I start tomato plants without the use of a hot-bed? I have tried several times, but have always failed.

I intend to collect some caterpillars this summer, for the purpose of watching their transformations. When they are butterflies, what shall I feed them?

Our Swiss Cousin's and Hawaii Nei's letters were very interesting. Why do you not write again, cousins? I have not seen a letter from you in quite a while.

I think Hawaii Nei is a missionary's daughter, but some think it is some one who lives in the United States and who writes as though she lives in the Sandwich Islands, to make it more interesting.

Please put my sister's name, Anna Wise, on the list, also mine. With many good wishes for the Club and members, I remain your friend,

Cortland Co., N. Y. LENORA WISE.

[You can start tomato plants without the use of a hot-bed in a pot or box filled with light soil and put in a southerly window of a room with an even temperature. The plants must have all the light they can get. Of course it is too late for this year. It is a good idea to collect caterpillars and watch their transformations. I wish that all of the Cousins who are interested in natural history would do the same thing. In this way much can be learned about entomology that otherwise would remain a mystery to you. Make a breeding cage out of a small box or box frame that has neither top nor bottom. Tack a piece of wire gauze over one opening of the box so the prisoners within may get plenty of air, and on the opposite side, fit a pane of glass to serve as a cover, so you can readily look in. Now put the box on the side, or what was the side before the top and bottom were removed, but which will now serve as the bottom, and, as many insects pupate in the ground, put two inches of dry soil in the box and your breeding cage is complete. In this cage put your caterpillars; keep them well supplied with fresh leaves of the kind on which they were found. Put down in your note book the date when you confined them, how they looked, how many legs they have, and their stripes, dots and other markings. Note also the dates when they spin their cocoons, how long they remain in the pupa state, etc., with such remarks and new facts as you may deem of interest. You will thus learn much of an exceedingly interesting and useful study, and a new field will be opened for your observation and reflection. Butterflies require no feeding—UNCLE MARK.]

DEAR RURAL COUSINS:—It will afford me great pleasure if you will receive me in your circle I should like to ask, what has become of all the boys and girls who used to write. Y. B. and Slayer-of-conceit, for instance. Well, girls, I can tell you, that is, if you care to know. They have been fascinated with some pretty face, and, as the old saying is, jumped the broom-stick. Most of you tell about your pets. I do not have any except my flowers. Flowers and books are my favorites, and I do not care much about anything else. I like to do housework of all kinds. Perhaps I will join your Horticultural Club, or at least write, and let you know what success I have this fall, if life and health are spared. I should like to ask what the expense will be for books for the imaginary voyage. Also where I can get roots or seeds of the Trailing Arbutus and what will they cost. I wish you all good-night. OLD MAID.

Hillsdale Co., Mich.

[Read what Uncle True has to say concerning the voyage. The Trailing Arbutus grows wild in New England and many other parts of the United States. It is very pretty, but somewhat difficult to make it grow. Woolson & Co., Passaic, N. J., offer established plants at 30c. each.

UNCLE MARK.]

DEAR UNCLE MARK:—I hope I may be allowed to join your circle. I like the letters very much. I wrote once to Uncle True, but he threw it into the waste paper basket, I suppose. I go to church whenever I can; I heard two sermons last Sunday. Uncle Mark, you must publish this. I can work lots; I feed horses, cows, sheep and chickens. I hoe, pull corn and pick cotton. I am cousin

SNOW FLAKE.

Uncle True had no doubt a good reason for throwing Snow Flake's letter in the waste-basket, and, as Snow Flake neither gives her name, the place where she lives or even the State, so I have no idea whether it is a snow-flake from "Greenland's icy mountains," or some other cold place, I must say, that I am tempted to do the same. I will take this occasion to ask all who write to me to give their full name and address. I shall not publish their real name if they do not wish me to, but I must, nevertheless, have name and address. Several who have applied for membership in the Horticultural Club have given me only their initials, and others have neglected to give their addresses. Of course, I can send no seeds or plants to them, the same as I do to all other members.

UNCLE MARK.

DEAR UNCLES AND COUSINS:—Hurrah! we are better off than I supposed, we have two uncles instead of one. Uncle True, in case you make your grand tour to Europe this summer, I want to engage my passage if you will take a cousin with as little luggage as I have. I have McNally's system of geography, but in our very small store of books we have no book of travels. As we live on a farm and never know what it is to be out of work, I will not have as much time or money to spend for books as I wish I had. I love to read and study, and want to learn all I can. Will you take me? Cousins, where are you? I miss your letters in the RURAL. Write and brighten up the corner. We received the flower seeds all right—many thanks to the RURAL for them; not knowing how to plant Balsam seeds, I planted the smallest seeds as I would Pansies, in a box in the house, some of the larger ones I planted in a bed in the door yard. CRAB APPLE.

Crawfordsville, Iowa.

DEAR UNCLE MARK:—I take great interest in the RURAL. I have just planted a flower-garden and lots of plants have come up which, I am sorry to say, are weeds. My Pansies I raised in a pot, and transplanted them into the bed after a cool rain, but I forgot to put paper over them and the hot sun dried them out and killed some of them. They were choice seeds too, and I'm real sorry. I have got a collection among which is the horned frog, of which you published an account some time ago. Are any of the Cousins interested in collections? If so, I would like to ask any of them living in California, Texas, or any distant State, that would like to exchange a small package of specimens, for things from this place, to immediately inform me of their address, that I may press a sufficient quantity of flowers.

F. M. A. BROOKS.

Madison, Wis. P. O., Box 1113.

DEAR UNCLE MARK:—I am a little boy out here in Oregon. I would like to join the Horticultural Club, for I am fond of flowers and like to work among them. I have a flower bed of my own in which is a double Hollyhock plant that is about five feet each way. Pa says it is crowding my other plants too much, so that I must have a larger piece of ground. My mother has some nice plants from the Hollyhock seed she received from the RURAL. There are a great many pretty wild flowers here, I have planted many of them in the yard, such as Violets, Mimulus, Lobelias and one other kind I would like to know the name of. When it blooms I will send you a flower and leaf, if I can press them nicely enough. I could write a great deal more about the flowers, but I am afraid this is too long already. Your young friend,

Linn Co., Oregon. ANGUS M. SMITH.

A LITTLE girl, on examining some Bible pictures, had great difficulty in remembering which were angels and which were men; in explanation, her mother told her that those with wings were angels. Showing the same picture to one of her young friends a few days later, Ida remarked, "These are angels, Tottie, don't you see the feathers?"

Sabbath Reading.

THE STILL HOUR.

MEN often give in the hope of receiving again; their charity is bread cast upon the waters that they hope to find somewhere after (or perhaps, before) many days. Of charity that has not paid, many bitter complaints are heard. But God's ways are not our ways. He gives in the hope of giving more. That is his object in giving. "Grace for grace," grace *upon* grace, is his method; one gift is sent to make room for another. As one day's dew and sunshine enables the flower to take more dew and sunshine the next day, so all God's spiritual gifts enlarge the spiritual nature to the end that more grace may be bestowed. If we have received any good thing from him it is not a sign that he wants anything from us: it is a token that he wants to give us something more.

WHEN the two disciples, walking with Jesus to Emmaus, drew near to the village whither they went, it is said that "he made as though he would have gone further; but they constrained him, saying, 'Abide with us, for it is toward evening and the day is far spent.' And he went in to tarry with them." Did he not wish all the while to tarry with them? Did he not know that he should tarry with them? Why, then, did he "make as though" he would go further? Was not this insincerity? Did he not by actions, which are said to speak louder than words, declare that to be his wish and purpose which was not his wish and purpose? Such a small criticism as this might easily enough be made, not only by those who seek to discredit the divinity of Christ, but also by quite another class of teachers. There are those who will not own that Christ ever accommodated his teaching to the defective knowledge of those to whom he spoke. But does not every wise teacher continually do this? Does he not keep back the knowledge that he might give them with no effort, because he knows that it is better for them to find it by searching for it?

An acted ignorance, an assumed curiosity on the part of the teacher, often stimulates a pupil more than many exhortations to study. It is an overnice scrupulousness that would condemn the whole Socratic method of teaching. No other method gives such great zest to learning. And something like this is seen in this case. Jesus does mean to tarry with these disciples; but he does not mean to stop without an invitation, because he knows that their pleasure in entertaining him will be far greater if he is their invited guest than if he invites himself. He wants them to have the reward that comes from the proffer and the exercise of a kindly hospitality. From this point we get a wide outlook over the whole field of prayer. God often withholds gifts that he wishes and intends to give us, simply because he knows that it will do us good to ask for them. It is not his purpose but our relation to him that is changed by our prayers. —*Sunday Afternoon.*

SUBMISSION to the will of God, with experience of his support in pain, sickness, and affliction, is a more joyous and happy state than any degree of health or worldly prosperity.—*Adam.*

IN prosperity many have forgotten God, who, in adversity, have thrown themselves into his arms.

PERSONAL ITEMS.

Lord Beaconsfield has denied the petition of his Hughenden tenants for lower rates, although the nobles of England have generally reduced the rents of their tenants from 10 to 30 per cent.

The celebration of Emperor William's golden wedding began at Berlin Wednesday. The city was gaily decked during the day and illuminated brilliantly at night and thronged with people.

Edward S. Stokes, the slayer of Jim Fisk, is dabbling in the mining business on the Pacific coast. He is mentioned in a Montana City (Nev.) newspaper as selling his interest in one mine for $65,000.

Jefferson Davis was present at a meeting of the Mississippi Press Association last week, and declared that he had never yet seen a "Southern woman reconstructed." A perfect panic of applause greeted the remark.

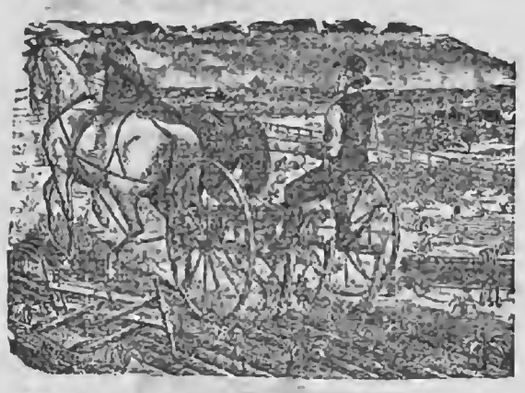
The Bismarck of to-day is certainly not a handsome man. He is so fat as to be more unwieldy than ever; he has a puffy and unhealthy look, and his appetite hesitates never. Bread and cheese and beer are said to be what he especially likes

Old John was a woodchopper at Austin, Minn. He lived in a cabin that was hardly more than a kennel, wore rags, and appeared to have no thought except to defend himself against hunger and cold. A kindly widow employed him often, and looked after his welfare a little. Lately, when he was at work in her woodshed, she remarked, "John, I'm going to get married next week." "Really?" he exclaimed, with an earnestness that was unusual with him. "Yes, really: but why do you care?" she replied. He muttered something unintelligibly, and walked off into the woods, where he gathered some poisonous weeds, ate them, and died. A photograph of the widow was found in his cabin.

You can save Doctor bills and keep your family always well with Hop Bitters.

Implements and Machinery.

The Robbins Cultivator



AND BROADCAST SEEDER.

CHEAP! The Implement for the Times. CONVENIENT!

Adapted to almost every variety of farm tilling and seeding, and sold at less than the price of a Grain Drill alone.

THE ROBBINS is a two-horse riding or walking Cultivator; is especially adapted to breaking up fall plowing and fitting it for spring crops; for cultivating Corn, Potatoes, Beans, or any crop planted in rows or drills, the axle being set high enough to clear corn at the last working; for work on fallows, and for fitting any ground which would ordinarily require cross plowing.

It is provided with an accurate and reliable *force feed* seeding attachment, which sows all kinds of grains *broadcast*, in front of the shovels, in any desired quantity to the acre; and by gauging the depth at which the shovels are allowed to work, the grain can be covered as deep or as lightly as desired. Send for circular.

Manufactured by the

Robbins Cultivator Co., Jackson, Mich.

And for sale by dealers generally.

A STOCKHOLDER IS NOT ALWAYS AN ENVIABLE MAN.

Wit and Humor.

"WHAT'S the man yelling at?" asked a farmer of his boy. "Why," chuckled the boy, "he's yelling at the top of his voice."

MRS. Partington has been reading the health officer's weekly reports, and thinks "total" must be an awful malignant disease, since as many die of it as of all the rest put together.

THE weather continues very changeable in central New York. A few days ago a man in that country was sunstruck right at the close of a snow storm because he couldn't get his ulster off quick enough.—*Burlington Hawkeye.*

A VALUABLE INVENTION.—"What a great thing the invention of the steam engine is!" exclaimed a Frenchman, sipping his coffee in one of the Paris restaurants. "Why so?" inquired a friend sitting next to him. "Because it is to that great invention that I owe my fortune. My aunt, who was killed last month by a railroad accident, has left me $20,000 A month ago to-day I was hard at work trying to earn a living; to-day I am a gentleman. What a great invention the steam engine is!"

The Stomach Cannot be Freighted

With greater trash than a violent drastic purgative. True, such a medicine relieves constipation for the time, but at the expense of great injury to the intestinal canal which it both inflames and weakens, thus unfitting it for the performance of its proper functions. Widely different is the action of Hostetter's Stomach Bitters, a tonic aperient which produces effects, prompt, indeed, but never violent and convulsing. The purity of its botanic ingredients, its unobjectionable flavor, its genial influence upon the mind, and the thoroughness of its remedial action in cases of constipation, liver complaint and dyspepsia, combine to render it a most desirable family specific. It increases both physical vigor and substance, tranquilizes and invigorates the nervous system, and gives an unwonted relish for the food. A wineglass three times daily is about the average dose.

NORWEGIAN BALM FOR CATARRH

Ask your Druggist if his customers don't say that the NORWEGIAN BALM gives immediate relief, in every case.

Ask your Druggist if his customers don't say that the NORWEGIAN BALM is very agreeable, and perfectly safe to use.

Ask your Druggist if his customers don't say that the NORWEGIAN BALM immediately cleanses the nasal passages of all foul matter, and restores the breath to its natural purity.

Ask your Druggist if his customers don't say that the NORWEGIAN BALM is very soothing and healing, and that "it is really a luxury to use it."

Ask your Druggist if his customers don't say that the CHECK-SPRING, on the tube of Phelps' Nasal Douche, is a wonderfully simple and convenient little contrivance.

Ask your Druggist if he ever sold a Catarrh "remedy" that gave better satisfaction than the NORWEGIAN BALM.

Ask your Druggist if he don't sell *more of* the NORWEGIAN BALM than of all other "remedies" for Catarrh.

Ask your Druggist not to try to induce you to take some *Irritating Snuff* or other *dead stock*, because he is *just out* of the Norwegian Balm.

Ask your Druggist for PHELPS' NASAL DOUCHE or FOUNTAIN, with CHECK-SPRING, *and take no other.*

Ask your Druggist for an 18 Page Pamphlet, and *read* what those who have used the NORWEGIAN BALM say about it.

IMMEDIATE RELIEF GUARANTEED.
Quart Bottle, $1. —*sufficient for Two Months' use.* Trial Bottle, Twenty-five Cents.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 26.
WHOLE No. 1535.

NEW YORK, JUNE 28, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

Rural Architecture.

A VILLA.

L. F. GRAETHER, C. E.

THE design here described, exhibits a small villa, which bears a similarity to the "Rural Residence" published in our issne of May 17; in fact, it is a modification of the same. The elevation answers as well for the plans of the "Rural Residence" as it does for those given below, and the sketch conveys also an idea of the manner in which the surrounding grounds may be laid out, so as to be in harmony with the structure.

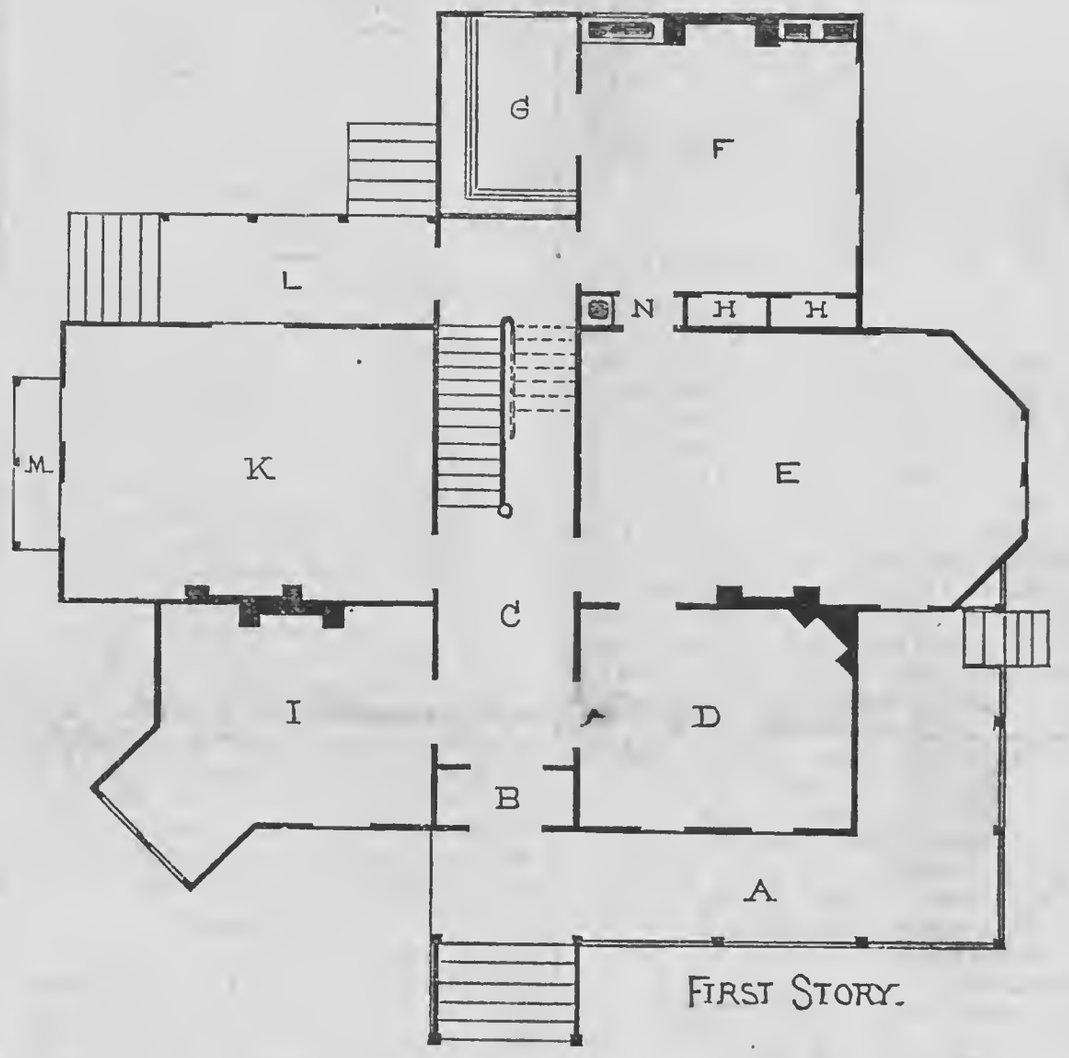
The plans are explained as follows:

FIRST STORY. A, piazza; B, vestibule; C, hall with main flight of stairs to 2d story; D, parlor, (12x15 ft.); E, dining-room, (15x24 ft.); F, kitchen, (15x17 ft.) including closets, H, H, and passage N, from dining-room to kitchen; G, pantry, (8x11 ft.); from the piazza L a passage leads under the stairs to the kitchen. The library I (12x15 ft.), and the sitting-room K, (15x20 ft.) are situated on the left side of the hall.

The SECOND STORY (see page 406) contains in front the hall A, the bedrooms, B, C, and E with closets L, L, and balconies D, D. A few steps N, lead from the stage G of the main stairs to the side hall H, around which the bathroom F, and the bedrooms K and I are grouped. The latter may be used as servants' bedrooms. M, denotes the several roofs above A, I, K and L in the first story.

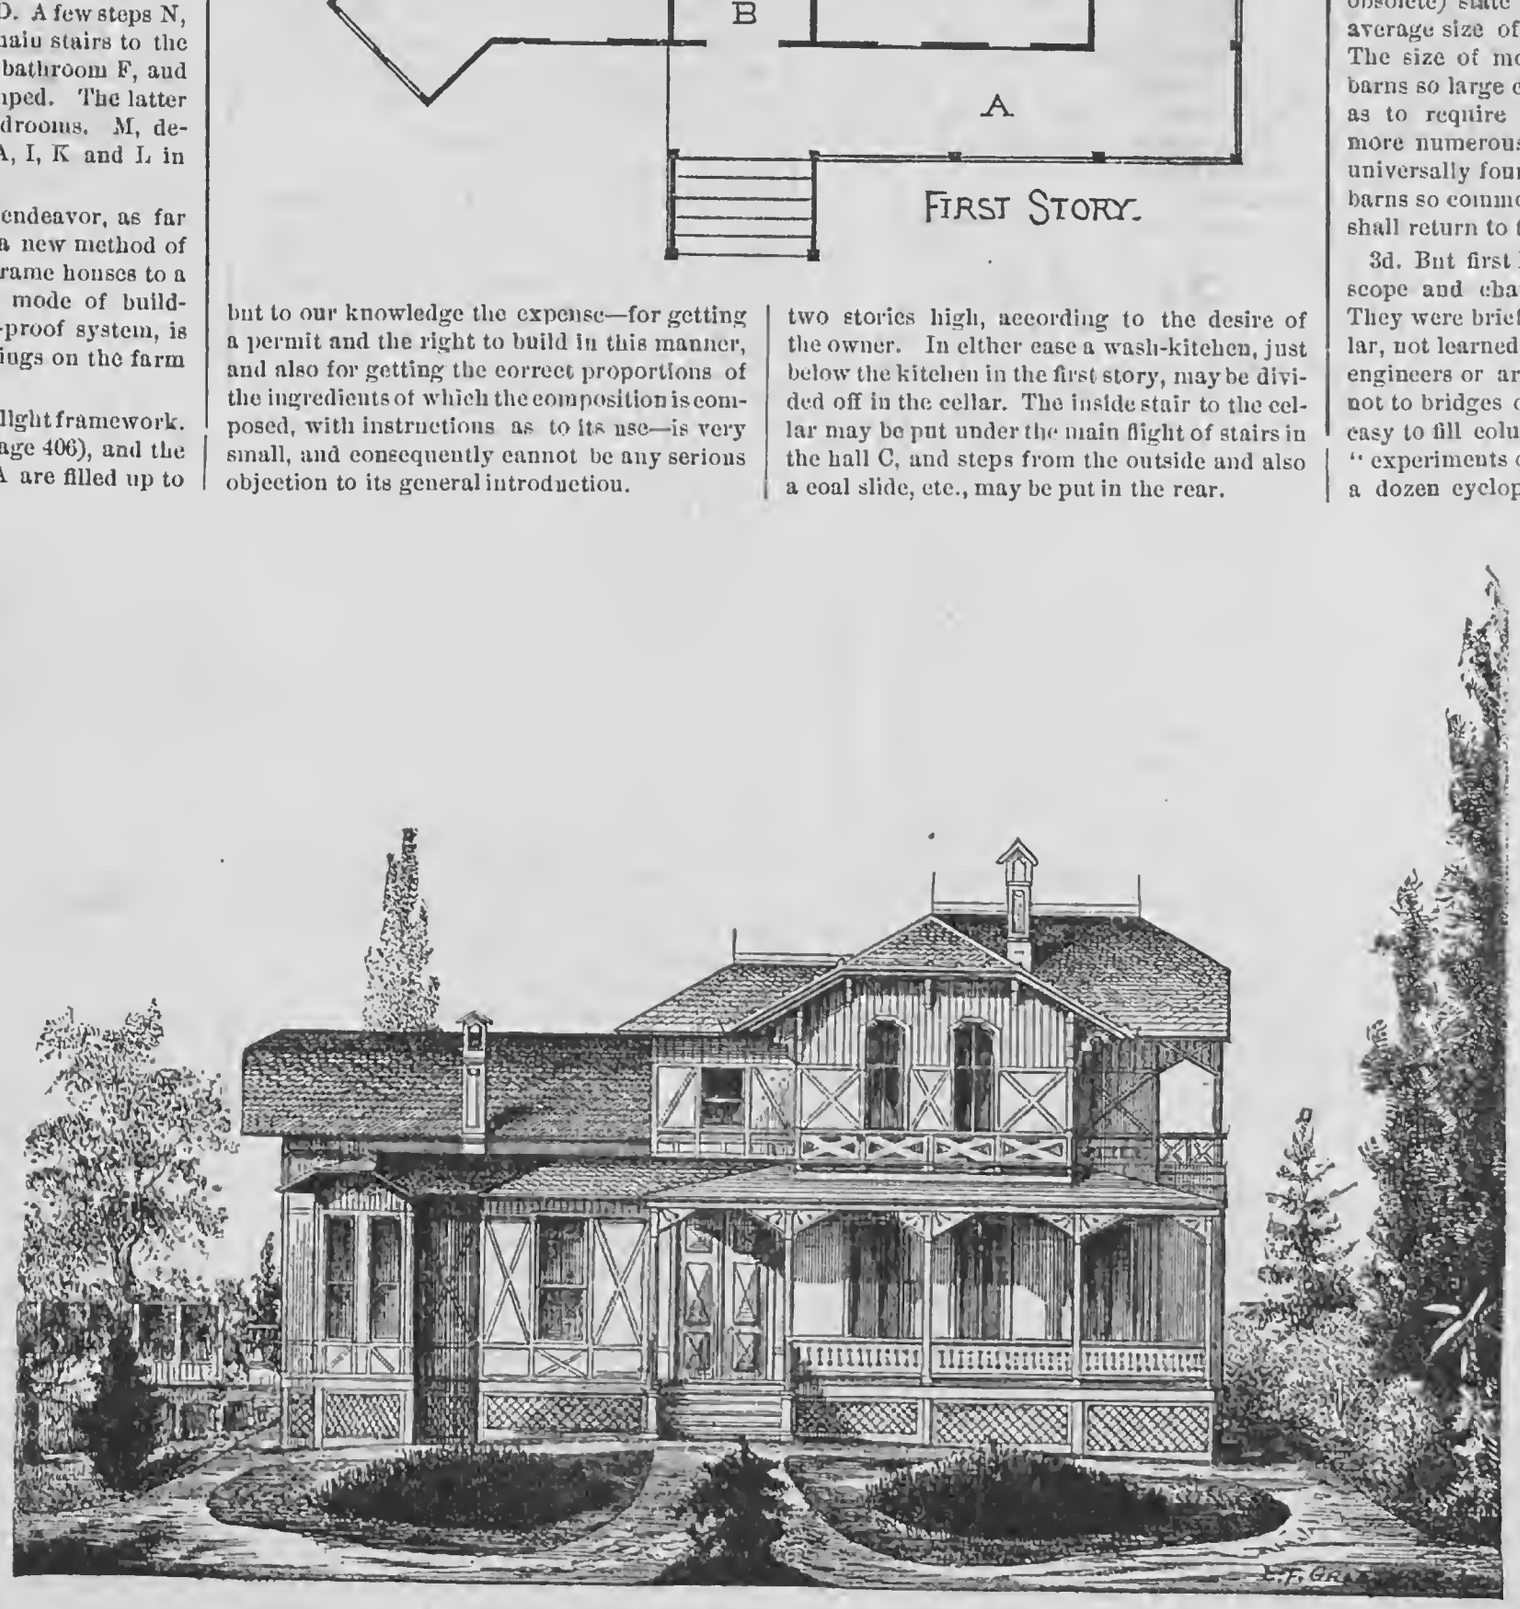
In this connection, I will endeavor, as far as space permits, to describe a new method of making, at a small expense, frame houses to a great degree fire-proof. This mode of building, called the Schillinger fire-proof system, is particularly adapted for buildings on the farm and at watering-places, etc.

Such buildings require a very light framework. This is inclosed (see Fig. 1, page 406), and the spaces between the studds A are filled up to the hight of the plate with fire-proof composition D. The composition consists of a mixture of sand, lime and plaster, or *debris*, and when set it is quite light, yet very tough and firm. Before the composition is applied, the studds, sills, etc., are inclosed with tarred paper B, to prevent dry-rot. The inner side of the studds is covered with slates L, nailed thereon. Clasp-nails C are driven into the studds A, so as to make the composition D adhere firmly thereon. The inner side of the wall receives, after the composition has set, a brown coat and hard-finish E, while the outside may be covered either with a coat of cement, plaster, or a siding F is fastened against cleats C, thus leaving, between the composition and siding, an air-space necessary to prevent dampness. The partitions are constructed in the same manner; the floors and roofs are "deafened" with the composition, as shown in Fig. 1. Each room is thus rendered, to a great degree, fire-proof. Such a building will only cost eight per cent. more than an ordinary frame building of the same dimensions. The foregoing plans, and those of May 17, may, with but little alterations, be made suitable for this fire-proof system. There is, however, one trouble about this fire-proof method, and that is, it is patented; but to our knowledge the expense—for getting a permit and the right to build in this manner, and also for getting the correct proportions of the ingredients of which the composition is composed, with instructions as to its use—is very small, and consequently cannot be any serious objection to its general introduction.



FIRST STORY.

No cut is here given for a cellar plan. A cellar may be either arranged under the whole house or only below the part which is carried two stories high, according to the desire of the owner. In either case a wash-kitchen, just below the kitchen in the first story, may be divided off in the cellar. The inside stair to the cellar may be put under the main flight of stairs in the hall C, and steps from the outside and also a coal slide, etc., may be put in the rear.



VILLA.—ELEVATION.

"AXIOMS" IN BARN-BUILDING AGAIN.

W. I. CHAMBERLAIN.

THE RURAL of May 17th contains a criticism of my "so-called axioms" in the RURAL of February 15th. The writer, I think, fails to give credit for the implied and *expressed* limitations in my articles, for their extreme brevity and consequent lack of fuller limitation and explanation, for their character and scope, and for the average common sense of farmers. He also, I think, falls into some errors in correcting what he deems to be mine. The importance of the subject seems to justify further discussion.

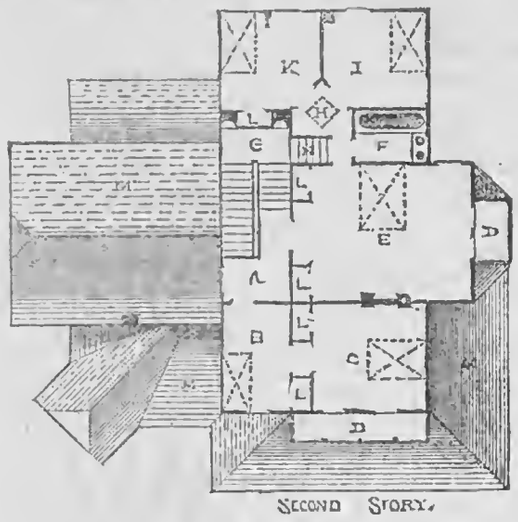
1st. The writer says "the 'axioms' are true only when certain conditions exist." But I said as much distinctly at least once, and implied it all the way. I said, "It pays to economize roof by making the barn as high as possible *without inconvenience*." Now a barn "a mile high" wouldn't be "convenient" in Ohio. Farmers here do not like to pitch hay to that altitude, and are not in danger of building barns that would render it necessary. Their "common sense" can be trusted so far. If the case is different in Michigan, my Lansing critic is right in lifting a warning voice.

2d. The "*implied* limitations" are the common sense of men, the existing (or partially obsolete) state of barn architecture, and the average size of farmers in the United States. The size of most farms here will not call for barns so large either vertically or horizontally as to require timbers materially larger, or more numerous proportionately, than those universally found in the 30x40 or 24x30-foot barns so common everywhere at the North. I shall return to this statement presently.

3d. But first I wish to call attention to the scope and character of my former articles. They were brief, not full; practical and popular, not learned; intended for farmers, not for engineers or architects: applicable to barns, not to bridges or towers. It would have been easy to fill columns with figures, formulas and "experiments on strength of materials" from a dozen cyclopedias, treatises on mechanics, and engineers' pocket or handbooks. But I think I have observed that the less a writer introduces book knowledge in an agricultural paper, the better it is for all concerned. I have also noticed that when formulas or principles are introduced from books, they should be carefully explained and "corrected" for the practical variations that occur. For instance, the writer says "A very little study would have shown him (the present writer) that to construct a barn-frame 26 feet high *equally as strong* as one 13 feet high, would have taken for all upright pieces, *nearly four times as much material*." "Then," he evidently means "for," since this is his only proof of the above statement—"it is found that the breaking load on the end of a post 13 feet high, is 11.4 tons, while that of a post 26 feet high and five inches square, is only 3.4 tons." This amounts to saying that posts half as long are (about) 3½ times as strong. But "a very little study" will show that while this is true (essentially) of posts standing *alone*, vertically, loaded on top and *unsupported laterally* to keep them from springing or bowing, and "crippling." It is absolutely untrue of posts in a

barn, supported, as they always are, by girths, beams, braces and siding, so that they cannot bend in any direction. For how does the "breaking load" on the end of a vertical post break it? Evidently in one of two ways: either by springing or bending it laterally till it splinters on the convex side, and "cripples" or crushes together on the concave side; *or* by absolutely crushing the timber into itself straight down—practically, always in the first, and never in the second way. And so practically for barn purposes a 26-foot post, kept from lateral flexure by girths, etc., (every 3½ feet, say), is as strong as a 13-foot post similarly supported. "Practically," I say, for in barns of either hight we always use (for mechanical reasons) posts and all vertical timber and lumber *immensely stronger* than are required for any vertical strain that ever comes upon them. For a 30x40-foot barn with 13-foot posts, no one uses less than 8x8 main posts, 4x4 girths, and inch boards for vertical siding. Use now exactly the same kind of material in a barn 45x100 feet and 26 feet from basement to eaves, (as large as it is profitable to build, probably, and as large as our farms ever require), and compute the vertical strength of the timber and lumber. By the figures of my Michigan critic a 5x5 post 26 feet high, unbraced laterally, will sustain 3.4 tons. But the "tensile" strengths of posts vary as the area of their cross-sections; that is, the strength of a post 8x8 inches would be to that of one 5x5 inches as 64 to 25 and the 8x8 post would therefore sustain 8.7 tons unsupported laterally from flexure. Support it midway now in both directions at right angles by girths, and, as we have seen, it will sustain 3½ times as much, or over twenty-eight tons. Support each half midway laterally again, and its strength is again more than trippled and equals over ninety tons; support each quarter laterally so that the girths shall be only 3½ feet apart and the strength is again more than trippled, and equals over 270 tons.

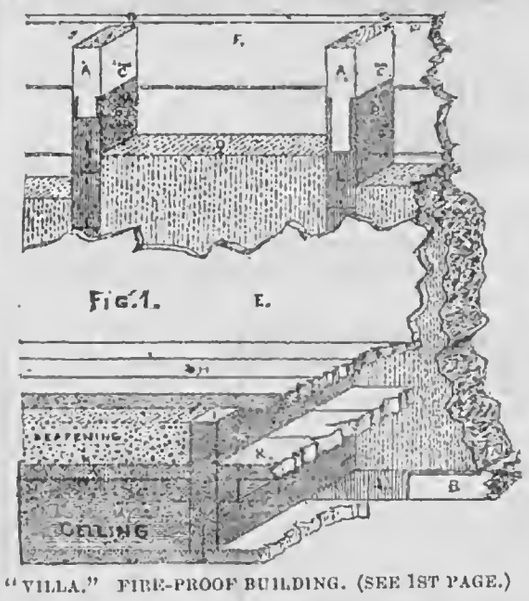
Nearly the same astonishing figures are reached "from the other end" so to speak. Haswell, Trautwine, the American Cyclopedia, and half a dozen other authorities give the "breaking load" or "crushing weight" of posts of several of our hard woods and of yellow pine and pitch pine as *over four tons per square inch* of section. This holds true when the laterally unsupported length of the post is not more than five times its diameter (of round posts) or "side" (of square posts). Now, in an 8-inch post, five times the "side" is 40 inches or 3⅓ feet, the supposed distance between the girths of our barn posts. And four tons to the square inch of a section will give 4x64 or 256 tons; nearly the same as before.



"VILLA." (SEE FIRST PAGE FOR DESCRIPTION.)

Now, in a barn 45x100 feet we have, say, six "bents" and each bent has four main posts; 24 in all, and their combined "tensile strength" will resist a "crushing load" of over *six thousand tons*. But the strength of the inch siding is yet to be added, firmly nailed as it is to the plates, girths and sills and parts of it to posts and benches. The area of a cross-section of the siding is *more than double* the area of the cross-sections of all the posts, and therefore the siding may be set down as able to bear a crushing weight at *least equal* to that borne by the posts, and we shall have as the combined vertical "tensile strength" of the barn the astonishing sum of more than 12,000 tons, or twenty-four million pounds, as the weight which, if evenly distributed would crush down the vertical timbers and lumber of this barn. But "The weakes' spot' mus' stan' the strain" and engineers and architects always divide the "ultimate strength" by some number called the "factor of safety" and for a "dead load," as in this case, *four* is deemed ample. Dividing then by four we have 3,000 tons as the "working strength" of the vertical timbers and lumber, whereas the actual load they ever have to sustain is never over 300 tons—barn, contents and snow on roof all told. And be it remembered the timbers, etc., were supposed to be of the same size, and same (really less) proportionate number as those universally used in barns of about one-eighth the cubic contents. It thus appears that though "a very little study etc." might lead us to suppose we must "quadruple the size of all vertical timbers" a more thorough knowledge of the principles involved and of the requirements and existing facts o the cases considered in my former articles, and of the practical application of the former to the latter, will show that within the existing limits of our American agriculture, no material increase will be required. A similar computation will show the same to be true of the horizontal and roof timbers involved in the 2nd Axiom, and I hope to find time to give it in a future article with diagrams and definite computations.

The above computations are made on the suppositions that all posts, etc., are supported laterally, so as to be absolutely free from lateral "sag" or "flexure," which is not strictly but only approximately true, especially of some interior posts. But abundant allowance is made at almost every step of the figuring, in the "factor of safety," and in the final division *by ten*, to reach the "actual load."



"VILLA." FIRE-PROOF BUILDING. (SEE 1ST PAGE.)

My use of the word "axiom," against which the writer protests, was fully explained at the outset. After defining the word, I said, "Sometimes, however, our attention must be called to it (a given truth) before it is seen to be 'self-evident.' This is the case with some of the axioms of barn-building, to which I propose *to call attention*"—just what I did, no more, no less, by means of a single simple diagram for each briefly and simply *explained*, not argued or debated. I beg pardon for adding that constant use of "axioms" for fifteen years of my life in the school and college recitation rooms, both as pupil and instructor, had not left me ignorant of the meaning of the word. I chose to use it rather in its original sense, as shown by the Greek word from which it comes—a thing "worthy" of belief. And I have noticed that many of the "axioms" of science,—natural, physical, political and intellectual as well as mathematical—are not only not seen to be "self-evident" till attention is called to them, but are constantly disbelieved, or at least disregarded in practice.

Summit Co., O.

Farm Topics.

NOTES FROM THE RURAL FARM.

Mr. Augustus Hewlett is a near neighbor of ours. He is sixty years of age, and has earned the reputation of being "the best farmer on this part of the island." There is no pretense, no fancy farming, no "highfalutin" anywhere to be seen. The buildings are commodious and substantial. They have been built with an intelligent design simply to subserve, in the most economical, labor-saving manner, the uses for which they were intended. Everything—the hennеries, barns, sheds, roads, vegetable and flower gardens, fences—show that there is just that amount of work employed which is necessary to keep all in that grade of systematized order which will bring the most profitable results from the capital invested. Many good farmers have hobbies, so that from a walk over their farms it is easy for a stranger to tell in what department of farm industry the owner is most heartily interested. Not so here. Work, and a sufficiency of it, is given where most needed, and the remotest part of the farm fares as well as that which is seen by visitors or the passer-by. Let us first remark upon the

Orchard.

The apple trees are about twenty years of age, and not more than twenty-five feet apart. Every two years the soil, which is a sandy, somewhat gravelly loam, is covered with from three to four inches of coarse, salt-meadow hay and drift. This preserves the moisture during droughts, and prevents all weeds and grass from growing. Fowls (all Black Cochins) are permitted to scratch in this hay and devour the worms and insects which there accumulate. The earth thus scratched bare one day will be covered the next by the fowls, which know that their food is to be found most plentifully *under* the hay. Thus the entire covering is turned over, so to speak, as often perhaps as once a week; the soil is exposed to the air and fungoid growth to a harmful extent prevented. This hay, of course, undergoes a slow decomposition, so that at the end of the second year it is plowed under, supplying all needed manure to the trees, when it is at once replaced by a fresh covering of the same material. Mr. Hewlett, whose satisfaction with his methods is not so great as to lead him to exaggerate their good results, estimates that in a series of years a one-acre orchard so treated will yield as much fruit as a three-acre orchard in grass. About young trees growing here and there he lays shingles or the bark of trees, six inches or more wide, covering a circle six feet or more in diameter. This is intended to serve as a mulch in place of hay, which the fowls would at once scratch away, as they are permitted to roam whithersoe'r they will.

The round-headed borer (Saperda bivittata), the great enemy to apple trees here, is prevented from depositing its eggs by the use of linseed oil, in which a small quantity of lead is mixed—just enough to show color, in imitation of the color of the bark. It also forms a thin, glazed coating, rendering the paint more durable and effective than if the oil alone were used. A band is painted around each trunk, beginning just beneath the earth, a foot wide. Mr. H. does not believe that the borer is kept away because the paint or oil is offensive to it, but because it effectually conceals the bark from the recognition of the moth. Whitewash would prove just as effectual, he thinks, if applied often enough. But the showers of May and June, when the eggs are deposited, ofttimes wash off the lime, exposing the bark in places which may escape notice. He has used this oil for twelve years, and has never known it to harm the trees. Of course, the bark, when rough and scaly, must be scraped off before the paint is applied.

Hennery.

This is two-thirds under ground. The floor is cemented—the nests either on the floor or elevated only a foot or so above it. It is warm in winter, cool in summer, while the more uniform temperature is favorable to the hatching of eggs and the comfort of the sitting hens. He raises, as we have said, but one breed, viz., the Black Cochins. He values them for all purposes, but especially for their quiet ways, and because, though having the run of the garden, they do not, like many other breeds, destroy strawberries, tomatoes and the like. In order to avoid the necessity of cleaning the floor of the house every few days, wheat chaff is thrown upon it to the depth of three or four inches. The hens scratch about in this, keeping the droppings and the chaff well mixed, so that it is from two to three weeks before it becomes sticky or any unpleasant odor arises. Then it is placed in barrels and used in the drill as a manure for potatoes, and a very excellent manure it has proven to be.

Sweet Potatoes.

These are with Mr. Hewlett a profitable and a very easily raised crop. Furrows are plowed nearly five feet apart and filled with manure. This is then covered rather deeply, and a wide, oval ridge formed nearly a foot high in the middle. Dibble holes are made every two feet apart and filled with water. The roots are thus puddled to within an inch of the collar, about which dry earth is strewn to serve as a mulch. Cultivated in this way, he can raise more sweet than Irish Potatoes to a given area. About the first of September the family begins to eat them, waiting until early frost before harvesting the bulk of the crop. Nansemond is the variety he cultivates—has tried Peabody and deems it worthless, because it is not a *sweet* potato except in name.

Grafting Pear Trees 80 Years Old.

There are upon the good farm of which we are writing, a number of old pear trees between 80 and 90 years of age, that bore very inferior varieties of fruit. Four years ago, Mr. H. began to top-graft them. The old branches were sawed off horizontally about 20 feet from the ground, and they were then grafted by what we have many times referred to and described as "*bark* grafting." Many of the stocks were as large as from three to five inches in diameter, so that any other style of grafting would have been quite impracticable. The bark, as soon in the spring as it will separate from the wood, is cut vertically the same as in budding. The cion is then beveled rather abruptly, so that when inserted between the bark and the wood and pressed down half an inch or more, it will make an angle with the stock of about 25 degrees. From three to half-a-dozen cions were inserted in each stock, according to size, and the whole covered with grafting wax—bast or bandages of any kind are not needed. Grafted in this way not one cion in 25 failed. It is worthy of note that in some instances the *entire* heads were cut off at the same time, so the "pumping" process was left to be carried on by the growth from the cions alone and such suckers as appeared here and there. Four years ago this summer the first of these old fellows was grafted to Bartlett. Last summer (*i. e.*, the third year), it bore three-and-a-half bushels of pears. Another was during the same season grafted to Louise bonne de Jersey. This bore moderately last year. The others have since been grafted to Lawrence and Mt. Vernon.

NOTES FROM THE RURAL GROUNDS.

Additional Strawberry Notes.*

DUNCAN.—Last year's remarks as to this, need not be changed owing to this season's observation. Medium size, good flavor, quite prolific, moderately firm and the earliest sort we have tested.

DUCHESSE.—Average rather larger than Duncan. Ripens nearly with it. More prolific. Not easy to separate the calyx from the flesh.

FOREST ROSE.—Fruit averages large; of an obtuse-conical shape; of superior quality. Ripens through a longer term than most other varieties. The fruit-stems are strong, often holding up from six to ten large berries. Berries firm, light red in color. Vines vigorous, though complaints were made last year that they rust and burn.

CRESCENT SEEDLING.—Our report of this berry will not support the many flattering things that have been said of it. It is marvelously prolific; there is no doubt about that, but a majority of our vines are so weakened by overbearing that they lose their leaves and the berries wither. The berries average small, and the calyx clings. We have just counted (June 15) 126 berries, ripe and unripe upon one plant. But they are sour even when over-ripe. Under field culture or in matted rows, no doubt the Crescent will prove a profitable market berry, since productiveness and firmness are alone required for that purpose.

SHARPLESS.—Probably no other of the newer berries was more praised than this, last year. It is with us one of the latest. The plants are, under high cultivation, over-vigorous. The quality of the berry is fine, the size among the largest and the shape of all sorts, as our engravings (on page 408, this number of the RURAL) will show, the specimens for which were picked June 15 when the berries were still growing as fast and ripening as well as at any previous time. Whether it is a characteristic in other soils or not we cannot say, but here the peduncles shoot out, as we have said, like runners, so that a covering or mulch is the more desirable. The berries are firm, the plants fairly productive. All things considered, we place the Sharpless as first among the newer Strawberries.

GOLDEN DEFIANCE.—Rather late. Plants of sufficient vigor. In bearing a long time. Berry plump and of good flavor and perfect shape, which is constant.

PROUTY'S SEEDLING.—Berry very shiny, narrowly oblong, light red, quite firm, of fair quality; plant prolific, forms few runners, ripens the same sized fruit for a long time. A good sort for family or near market.

CHAMPION.—We have heard this variety so praised that we are unwilling to judge it from our plants, which were set out last fall. We may say, however, that the few berries borne are of goodly size and late in ripening.

Mr. H. Marvin, of Michigan, sent us last fall a dozen plants of an unnamed seedling, which were planted October 3. It seems to us, from a test necessarily not in any way conclusive, that it is a very promising seedling. The berries are many and large, of perfect shape and excellent flavor.

Glendale, Windsor Chief, Cinderella, we can not yet report upon. President Lincoln, Beauty and Great American have again done but poorly here.

Of all the above-mentioned, we should at this time and for this place arrange them in the following order of merit for family use: Sharpless, Prouty's Seedling, Forest Rose, Marvin (unnamed) Seedling, Golden Defiance, Duncan (for earliness), Duchesse (also for earliness), Crescent Seedling.

Sterling, Kerr's Prolific, Harrington Market, Belle de Lyons, Captain Jack are for this place in no respect superior to older sorts. These five varieties we have fairly tested, and shall now discard as unworthy of cultivation.

PIONEER.—The portrait of Pioneer, one of Durand's seedlings, is from an average-sized berry which we begged from Mr. Peter Henderson, who places it *first* in his list among the cream of all Strawberries. We asked him why he placed it first, and his reply was, as we stated last week: "Because, while it is as good and as large as Monarch, it is the earliest berry I am familiar with," or words to that effect. This is high praise, and we hope the berry will merit it, wherever grown. Mr. Durand is said to have devoted years to the crossing and cultivation of strawberries, and to have raised thousands of seedlings. It were a pity if nothing better than the Great American and Beauty were to reward him for his labors.

CHARLES DOWNING.—On the 13th inst., during a visit to the Rural Farm, we called upon a neighbor, Mr. Peter T. Hewlett, a respected farmer and horticulturist, eighty-six years of age. The family showed us a bed of Charles Downing Strawberries, about thirty feet square, made last spring, in April. Onions had been grown there for six years previously. Old farm manure was spread over and spaded un-

* See Rural New-Yorker of Sept. 7, last, for illustration of those varieties not here shown.

der and the plants set two feet apart each way and the runners cut off when they appeared. We have never seen a bed of strawberries that seemed to us of more value, whether size, quality or productiveness were considered. We have seen larger berries, but never before so many large ones, never before such uniformity in size in any bed of equal area. We walked over the plot to find the *largest* berry for an illustration. But there were no "largest berries." All that were ripe were nearly of the size of those represented—the two showing the slight variations in their form. It is a splendid variety, and while growing moderately well everywhere, attains very nearly to perfection in a rich, light soil, which is the character of that of the plot of which we are writing. Another plot in the same garden has been in bearing four years, and, except in a few plants, shows no signs of decadence. We have cultivated the Downing here for the past five years, but our soil and climate are not such as to develop its best traits.

Farm Economy.

FARM WORK FOR JULY.

HAY AND SEED WHEAT.—July is upon us with its long days and oppressive heat. In many portions of the country there is still much hay unent. It is rapidly going to seed, exhausting the roots and becoming of poor quality as the woody fiber increases in quantity. Cultivate corn frequently till the tassels appear. During July the wheat harvest will be successively under way in the various parts of the country. Before cutting, select a piece of the best. Save it by itself, and from this pick some of the best heads by hand for raising improved seed. This will help to prevent wheat from "running out."

INSECTS.—With increased heat insects are numerous and lively. There are so many such foes that a farmer in these days cannot keep up with the times unless he makes it part of his business to wage a systematic warfare on insect enemies. Caterpillars must be hunted and destroyed; white hellebore dusted on bushes infested with the currant worm; Paris-green applied to trees to kill canker worms; trees rubbed over with thin soft-soap to kill bark lice; Paris-green or London-purple in water sprinkled on potato tops; bands put about trees to catch codling moths; the plum trees still jarred to catch the curculios. In the vegetable garden there must be a constant warfare.

VEGETABLE GARDEN.—Keep planting a succession of some vegetables such as will be wanted late in the season, as corn, beets, cabbages, lettuce. Keep cultivating every week at least once, to prevent the weeds from getting a start. There is no royal way to kill weeds; but the nearest way to it is that of very frequent cultivation. Sweet potato vines at the North should be lifted occasionally to prevent them from rooting. Cultivate melons and squashes often as long as the vines will permit. Celery plants should be set out. Place them in soil which will not dry out. Celery is a marsh plant. Break the flowers off from rhubarb to prevent it from seeding, as that weakens the plants. Tomatoes should be trimmed and some low trellis placed near to keep them off the ground.

SMALL FRUITS.—Strawberries will be plowed up after fruiting, unless another crop is expected. If they are to remain another year, give good cultivation. Some fine manure should be added, and the runners kept cut off. Thin out and remove the old canes of Raspberries and Blackberries as soon as the fruit is ripe. Cut the tips of the new canes when about two feet or two and a half feet high, and cut the branches after they have grown a foot or more. Treat suckers as weeds, unless they are desired for planting.

This is the time to layer many plants. A liberal supply of small fruit is an essential part of a good living. It is now possible to have a supply the year round by canning. The house-wife will now be laying in a stock of currants, gooseberries, cherries, and raspberries.

Grape vines will need cultivation for a month yet. Some of the new wood should be pinched off, and some of the smallest branches cut off while young. It is a serious damage to any young vine or tree to bear a heavy crop.

MISCELLANEOUS.—Keep every thing growing in July; trees, shrubs, and young cattle. Attend to trees which were set in spring. Cultivate often if not mulched liberally. Flower beds will often do best if the land is well mulched with fine manure, or even manure a little coarse. Thin Apples, especially where they seem small or too full. It will pay. Attend to the grafts, and cut away limbs which shade too thickly. Rub off young twigs which start where they are not wanted. A little pruning of fruit trees may be done at this time. Mow the lawn often, even a little piece of it just about the house will add much to the beauty of a farm. Take good care of the flowers and shrubs. A few well cared for are far preferable to many poorly attended to. It is a good time to clip evergreens. They need not be formally sheared, but a limb may be cut back here and there to a crotch. The new growth, if cut in two at this time, will set liberally with buds for growth next year. Cut the tops off at least of most sorts, and the bottom will grow the thicker.

GO A-FISHING—The days are long and the work is hard. Do not neglect to take a little recreation now and then. This is especially for the younger members of the family. Even the girls generally like fishing. Perhaps some other recreation may be more agreeable. Very well, anything for a rest once in a while. The mind and body will be all the better for it, and labor will be more cheerfully performed after a day or two of rest.

FEEDING ROOTS TO CATTLE.

THERE is a general want of knowledge in regard to the proper method of feeding roots to cattle. When the roots are grown and well saved, it is of great importance that they should be economically and healthfully fed. The great objections to the use of roots are that it is supposed to be necessary to cut them, and that they are so mixed with earth as to be injurious to cattle, unless laboriously washed. Both of these objections are gratuitous. Mangels and beets contain from 88 to 95 per cent. of water and are very soft in texture, more especially when well grown and large in size, and are easily bitten even by sheep. But it is better to cut them into slices, or run them through a machine which shreds or pulps them. There is then no danger whatever that an accidentally large morsel may choke an animal.

FIG.1.

The work of cutting the roots is easy, and may be done quickly. For five to ten head, it is sufficient to use a spade or shovel with the edge ground sharp. The roots are thrown into a box and 10 bushels may be chopped with ease into slices in as many minutes. A tool made as shown at fig. 1, having cross blades, or one with parallel blades as at fig. 2 may be used. In the latter case the blades should be set so that the cutting edges are closer together than the upper edges; this prevents the slices from becoming fast in the spaces. Heavy blades will make the cutting easier, and it is only necessary to have the edges of steel. To shred the roots a different method is necessary. For the use of those who have many cattle and feed a large quantity of roots, there are machines made which reduce the roots to a pulp, in which condition they may be mixed with the cut hay, straw or corn-fodder and meal, making a very convenient food. The mixture of the succulent roots with the dry fodder is better for both, and renders the former unobjectionable on account of their bulk or watery character.

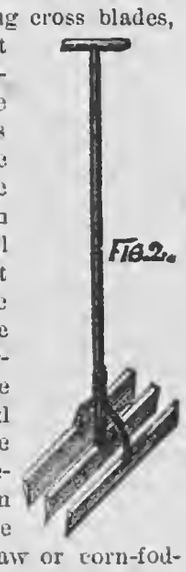


FIG.2.

A very simple root-pulper may be made as follows: A disc, two feet in diameter, is made of hard-wood plank (fig. 3) and filled with teeth made of quarter-inch steel bar ground to a slight bevel, as shown in the illustration. (a fig. 3). This disc is fitted into a box, as shown at fig. 4, and the roots, being thrown into this, are ground into pulp by the action of the sharp teeth, and the pulp is dropped in a box or basket placed under the machine, in which it can be removed for use. A different method, more frequently used, consists in the use of a cylinder armed with similar teeth and fitted in a box, changed somewhat to suit the action of the cutter. The cylinder is shown at fig. 5, and should be made of a piece of hard wood, 12 inches in diameter. The teeth in both cases should be made to just clear the lower edge of the box, so that the roots can be ground up to the last fragment.

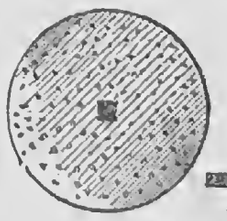

FIG.3.

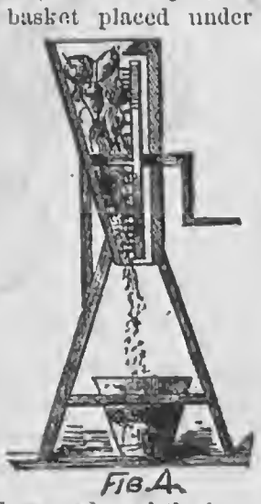

FIG.4.

The second objection, will never be urged by those who have experience in using roots, except under exceptional circumstances, such as unfavorable weather during harvesting, and when the roots are grown upon clay soil and are necessarily gathered while the soil is wet. Roots should be grown upon the lightest soil, to be chosen when the farm is clayey; and when the soil is sandy loam there is no difficulty in regard to adhering soil, if dry weather is chosen for the gathering. Then the roots are turned out either by the plow, or pulled out by the hook or the hoe, with no soil adhering to the fibers, unless these are unusually numerous and close. Mangels are remarkably free from these, and can usually be harvested in a perfectly clean condition. If adhering soil cannot be avoided in the gathering of the roots in wet weather, they may be left to dry upon the ground and in the handling during loading and packing in the pits and removing to the cellar or barn for use, much of the soil becomes loosened and is got rid of. At the worst, the roots should be washed free from soil, but it is very rarely that this is found necessary.

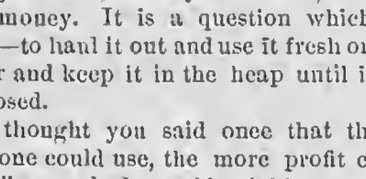

FIG.5.

HISTORY OF A POOR FARM.—No. 11.

Management of Manure.

IN SOILING cattle, the production of manure is very large and continuous. To handle it over several times for the purpose of decomposing it and getting it into such a condition for use as is generally supposed to be proper among farmers, is very laborious, and labor costs money. It is a question which is the better—to haul it out and use it fresh or to turn it over and keep it in the heap until it is decomposed.

"I thought you said once that the more labor one could use, the more profit could be made," remarked my old neighbor.

"The more labor that can be used *productively*, the more profit," I replied; "a man may dig holes and fill them up again, day after day, and yet produce no useful effect; while, if he plants a fruit-tree in each hole, and tends it well afterwards, the more he does, the better it is for the world and himself. Labor may be thrown away uselessly, and often is, in turning over manure and making it as is generally supposed, fit for use. I think manure is fit for use the moment it is taken from the stable; the only question is, can we make it better or more available by turning it over and keeping it rotting in a heap for some months before using it?"

"The decomposition of organic matter—such as stable manure—is a resolution of the matter, into its mineral and gaseous constituents; and as vegetables feed only on soluble mineral and gaseous matters, the decomposition is a necessary process previous to the use of it in the field," said Doctor Jones.

"Let us have that understood," said Mr. Martin, "the doctor is too scientific by half. I suppose he means that before manure is available for use it must be reduced to its inorganic elements; the potash, lime, phosphoric acid, and nitrogen in it, must be separated by decomposition, so that they can be dissolved in water and absorbed by the plants."

"You mean it must be well rotted," said the old gentleman, "if that is what you mean by decomposition, why can't you say so plainly?"

"Let us see if I cannot explain this matter so that we can get to the bottom of it before we discuss it any more," said I. "We take a heap of fresh mixed manure, a cord, if you please, and a cord of wood: the former we pile and let it heat and ferment; the latter we set on fire and burn. There is heat in both piles, but more in the wood pile. The heat is a process of combustion or burning, as much in one case as in the other; the low heat of the manure is a slow combustion, while the fire in the wood is rapid combustion. But with both piles, the effect will be the same in the end, if the manure is given time enough to work its slow process to the same result which the rapid process of the fire produces with the wood. There will be left in the end, simply a small pile of ashes from each cord. Suppose we had a cord of dry beech wood weighing 4,000 pounds, and a cord of manure weighing the same; there would be left of each a certain quantity of ash consisting of the following, viz.:

	In the wood.	In the manure.
Amount of Ash	22 lbs.	124.4 lbs.
Consisting of		
Potash	3.6 "	20.8 "
Soda	0.3 "	6.0 "
Magnesia	2.4 "	22.8 "
Lime	12.4 "	5.6 "
Phosphoric acid	1.2 "	8.4 "
Sulphuric acid	0.4 "	4.8 "
Silica	1.5 "	50.0 "
Chlorine		6.0 "
	22.0 "	124.4 "

"There was some nitrogen and carbonic acid in each, but these have been driven off by the heat, and are lost. The result is, that if we give the manure time to become completely decomposed or thoroughly rotted, we have 124½ pounds of mineral matter or ash, only, left of the two tons. And this is all that can be made available for the use of plants from two tons of manure, except the nitrogen which we have as yet taken no account of, just as the 22 pounds of ashes will be all that is left of the wood. Now, as in combustion, everything is driven off but the ash, we shall have lost out of that cord of manure, 18 pounds of nitrogen, which at first existed in it and which ought to have been saved. It appears then, that as combustion, rotting and decomposition, are, practically, the same processes when carried to the end, a change begins to occur from the commencement, and we begin to lose the valuable nitrogen as soon as a pile of manure begins to heat in any degree. It is true that the change of unavailable organic matter into available mineral matter also begins; but here the question arises: does this advantage compensate for the loss of the nitrogen which is the most valuable part of the manure? This is the whole story as plainly as I can put it."

"It seems to me," replied Dr. Jones, "that the fact that decomposed or, if you wish, rotted manure is immediately available is worth as much to us as the little nitrogen that may be lost in the process of decomposition."

"How much is the loss?" asked the old gentleman.

"That has been ascertained with great exactness by some experiments made by Dr. Voeleker of England," I replied; "but it might be well for us to go through with this matter in some regular order. To begin, let us take the following analysis of fresh mixed barn-yard manure, kept in a heap 14 days:

Composition of the Manure (2,000 lbs.):		
Water	1,323½	lbs.
Organic matter	562	"
(Containing nitrogen	(13)	"
Mineral matter (ash)	111½	"
	2,000	"

"A ton of fresh manure, you see, contains only 13 pounds of nitrogen and 111½ pounds of ash or mineral matter, and of this only about 20 pounds, including 14 pounds of potash and 6 pounds of phosphoric acid, are of any actual value; and in drawing it to the field we carry 1,323 pounds of water, which is practically useless. Now, if we should put 10 tons of this kind of manure in a heap, and keep it exposed in the yard to the weather for 3 or 12 months, there would be a difference in quality, as expressed in the following table, viz.:

	Fresh.	3 mos. old.	12 mos. old.
Weight of manure, lbs.	20,000	17,200	11,500
Contains water	13,234	13,844	7,542
Soluble organic matter	496	200	48
Containing nitrogen	(20¾)	(13¾)	(3⅛)
Insoluble organic matter	5,152	1,984	1,142
Containing nitrogen	(97)	(78)	(41⅛)
Soluble mineral matter	308	174	66
Insoluble mineral matter	810	1,098	2,702
	20,000	17,200	11,500
Total nitrogen, lbs.	126¾	91¾	45
Equal to ammonia	156	117	58

"Now, we can put our finger upon the loss and the gain, such as it is. After three months we have, instead of 10, only 8¾ tons of manure, with 600 pounds more of water; the organic matter has largely disappeared, having decreased from 5,648 to 2,184 pounds, and the soluble mineral matter has decreased from 308 to 174 pounds, while the insoluble has increased 288 pounds. But the nitrogen has gone to the extent of more than one-half of that which was most available, and 10 pounds of the other have disappeared. The losses in the manure kept over one year are positively ruinous."

"Do you mean to say that the manure which is lying in my yard since last summer, has lost nearly all that was good for anything in it?" asked the old gentleman.

"I should say it had lost all it ever had," remarked Mr. Martin; "I saw it yesterday with a foot of water over part of it, and a stream of water soaking from it down the hill into the road."

"Yes; the wind tore the spouts off the barn, and we have been too busy to put them up again."

"Well, all that water has probably washed out of your manure the whole of the soluble organic and mineral matter, leaving it destitute of any immediately available fertilizing properties;" remarked Dr. Jones.

"Made it good for nothing, or next to that," said Mr. Martin.

"If you had used that manure a year ago when it was fresh, you would have saved every portion of it," said I; "and this puts the case very well; for the fresh manure which I am now hauling out from the cellar and plowing under for corn, is safe and cannot lose a particle of its value anyhow, even should the corn not get the whole benefit this year; while, if I had kept it as you did yours, for a year, I might have lost nine-tenths of its value at the worst, and two-thirds of it, at the best; and if I kept it only three months, it would still lose very considerably. In using fresh manure we get the whole of its value in the end, without doubt; but in keeping it over, we lose a portion and get the rest in a more quickly available condition."

"Then you think it best to use the manure as soon as it is made?" said Mr. Martin.

"It depends upon circumstances. I would not like to say that positively. I think it best for me and for any other dairyman. Some time ago I was at a large dairy farm in Westchester Co., N. Y., where 200 cows were kept, and a wagon was kept in the cellar under the trap to receive the manure from the gutter as it was raked out every day, and as soon as it was loaded, it was drawn away to the field and

spread either upon the grass or upon plowed ground and harrowed in for fodder crops. There was nothing lost there, certainly; all that was in the manure was put to use at once. But a practice, however good, cannot always be used in all cases; and some farmers must do the best they can, although they lose something by it."

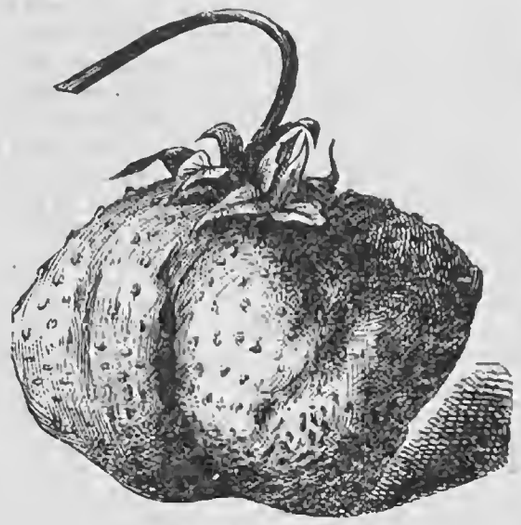
"Just as I did," replied the old gentleman.

Horticultural.

MR. SARGENT'S GARDEN.

BY A VISITOR.

Mr. Sargent's private garden at Brookline, a suburb of Boston, is one of the largest and most beautiful in the country, and famous for its extensive collection of trees and shrubs, including rare coniferæ, Rhododendrons, hardy Azaleas and many handsome deciduous trees. Certain kinds of greenhouse plants, as Indian Azaleas, Palms and Agaves, are also a specialty. About the end of May and first of June is the heyday of Azaleas and Rhododendrons, and in order that the public may avail themselves of such a floral treat, Mr. Sargent at this time freely opens his garden to the public, who greatly appreciate the kindness. And in order to make it more comfortable for visitors as well as to display the plants to better advantage, the Rhododendrons and Azaleas, relieved by graceful Palms, are tastefully arranged in beds and clumps under a spacious tent on the lawn, where also seats are placed whereon to rest and admire.



Sharpless, No. 1.

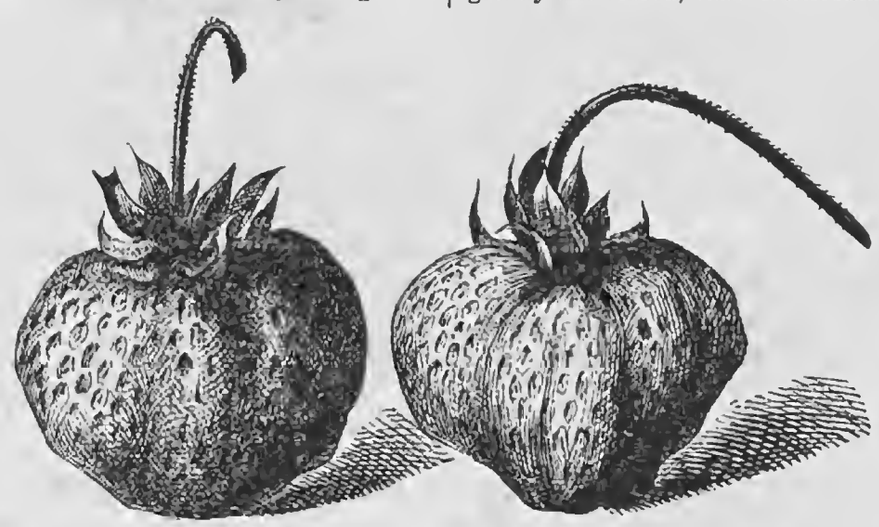
The greenhouse Azaleas are grown in pots, but the pots being plunged out of sight in the grassy turf, only dense floral pyramids, umbrellas and cushions, varying in color from the purest white to the deepest red, are left to view. As a rule, the azalea season would be past by this time, but Mr. S. retards the flowering period of his plants by wintering them in cold-pits, and otherwise, so far as he can denying them premature excitement. Chief among them are King of Holland, Decora, Bride of Abydos, Iveriana, Exquisite, Beauty of Europe, Criterion, Variegata, Flower of the Day, Crispiflora, Beauty of America and Daphne. Scores of plants of that exquisite hardy Japanese species, A. mollis, also honor the occasion. They are covered with creamy-white, yellow and pink flowers, and the tiniest plants blossom.

The Rhododendrons within the tent, are mostly those that are barely hardy enough to survive uninjured our winters out-of-doors. They are wintered in pits, sheds and cellars, transposed to their position under the tent during their blooming season, and then transplanted thence to a faintly-shaded place during the summer. This treatment they bear well and annually lift with better earth-balls. Among the finest are Mrs. John Clutton, white; the Queen, white, changing to blush; Purity, white; Chancellor, purplish lilac; Kettledrum, purplish crimson; Mrs. Milner, crimson; Charles Dickens, dark scarlet; Everestianum, rosy lilac; H. W. Sargent, crimson; John Walter, rich crimson; Michael Waterer, deep rose; Joseph Whitworth, rich lake; Stella, pale rose, with dark blotches; Eclipse, very dark; Katie Waterer, delicate rose; and other beauties, as Anstiu Layard, Mrs. Layard, Wm. Cowper, and the like. Mr. S. regards Lady Eleanor Cathcart as his prettiest Rhododendron, and next to it, Katie Waterer; but my own taste reverts to such intensely dark kinds as Joseph Whitworth. W. E. Gladstone has immense rose trusses, the individual blooms of which are the largest in the collection.

In the beds of hardy Azaleas are interplanted hardy Lilies of many kinds, Hyacinthus candicans, Tigridias, Narcissus, of sorts, and other bulbous plants, and thus a succession of blossoms is maintained during all the summer months. The Lilies, too, seem to enjoy the deep, cool soil of the rhododendron beds around the pond.

A north-and-east-facing bank near Mr. S's. residence, is planted with Rhododendrons, and there are also large beds of them in the neighborhood of a pond in the pleasure-grounds, and from them some curious facts may be gleaned. R. album elegans, a. grandiflorum and other whites usually considered hardy, were considerably injured last winter, whereas such kinds as Everestianum, Alex. Dancer, Charles Dickens, H. W. Sargent and Chancellor, occupying the same beds and growing under the same conditions, have not lost a leaf or bud, but look the very pictures of health.

The garden and pleasure-grounds, comprising some 130 acres, are naturally rolling and



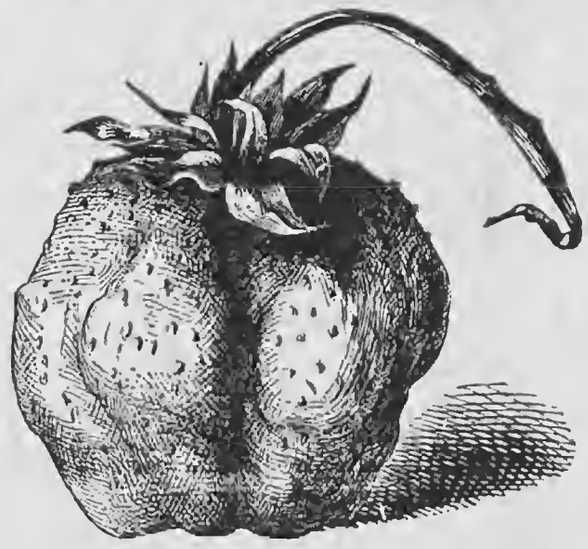
Charles Downing Strawberries.—(See Notes from Rural Grounds, p. 406.)

artificially much enhanced in beauty. Wherever a knoll came in contact to obstruct a view, it has been removed, divided or toned down, imperceptibly, as it were, but with pleasing result, and consequently many fine views of the surrounding country are commanded. The grouping of trees and clumping of shrubs are so disposed as to add tellingly to the effect. Beds are filled with Japanese Retinosporas which are perfectly hardy, and interspersed with Lawson Cypresses.* English Yews and some other less hardy plants, which require cellar or cold-pit winter protection. I also notice that beds which used to be filled with Cannas and other sub-tropical plants, are now permanently filled with hardy evergreen conifers, a change I thoroughly indorse.

Deciduous shrubs are very satisfactory, and just now masses of them are aglow in color. The copper-leaved Japanese Maples are as telling among shrubs as are copper Beeches among trees. Zanthoceras sorbifolia, "new," handsome and hardy, is going out of bloom; Viburnum macrocephalum, handsomer than any Hydrangea, is at its best; many kinds of "new" Weigelas—little bits of things imported from Belgium last year—have grown like Willows, and are full of flowers. Spiræa trilobata in sunny places are perfect snow banks; Paul's double, scarlet Thorn grows thriftily, but so far blossoms sparingly; the bold habit and handsome leaves and flowers of Rosa rugosa commend it for shrubbery clumps; Viburnum lantanoides, though a native, is, nevertheless, at this season one of the handsomest of garden shrubs; so is the Cockspur Thorn, with its wide head of horizontally-disposed branches covered with showy white flowers.

But one of the most commendable features of this garden is the beautification of the wild or uncultivated spots. Such corners and belts are thickly studded with Daffodils and Narcissus, of sorts, Squills, Tulips, Crocuses, Snowdrops and other bulbous plants, Forget-me-nots, English Primroses, some of our bolder composites and many other introduced wild plants.

Mr. Sargent's farm dairy is one of the neatest and most beautiful I have ever seen, and though perhaps beyond the means of the majority of farmers, it is a handsome model for the wealthy, and its arrangement may be equally suggestive to all. But as this is a strictly private department of Mr. S's. establishment, perhaps I have no right to mention it, and I would not, did I not know that his generosity for the welfare of mankind is equally extensive.



Sharpless, No. 2.

Sharpless, No. 3.

Our Strawberry Cuts.—As a rule, the pictures of strawberries and other small fruits displayed in catalogues, are not portraits, but fancy sketches. The faults are smoothed over—the size exaggerated. The above cuts *are* portraits and the reader may safely judge them as characteristic of these varieties and of the average size which they will attain under good cultivation.

*[Does not Lawson Cypress require protection?—Eds.]

Arboricultural.

EVERY-DAY NOTES,

SAM'L PARSONS.

Spiræa Trilobata.

One of our common Spiræas has pleased me greatly this season, viz.: S. trilobata. Though long familiar with the plant, I had, apparently, never before so fully realized the charm of the graceful curves of the branches, the delicacy of the leaves and attractive set of the flower. Spiræa Reevesiana is always beautiful in late spring, both in flower and general habit. It has, indeed, gained the lovely name of Bridal-wreath Spiræa, but to me either S. Thunbergii or S. trilobata merits more justly this honorable title. S. trilobata bends almost into semi-circles, its branches laden with exquisite rosettes of pure white flowers. Scarcely any cluster of sprays is more beautiful for the decoration of rooms than the curving branches of this Spiræa. The delicate texture of the leaf is also curious and very exquisite in its way. Old shrubs, like these, should not be neglected, which I fear is too much the case with S. trilobata. It may not be amiss to note here the importance of pruning Spiræas immediately after they are done flowering. Not only is the bloom rendered more abundant by thus pruning, but the foliage also is greatly improved.

Summer Pruning.

If every one does not know, every one ought to know, that now is the time to cut back the hardy Roses which have just done blooming. Perhaps, also, it is not known to every one that only in this way can a second series of flowers be obtained of any value on the so-called Hybrid Perpetual Roses. Early summer should be a busy time on the lawn in more ways than cutting grass and hoeing weeds. Summer pinching and pruning must be followed up continually, and decayed flowers removed from even Rhododendrons and Azaleas, although otherwise such plants require little pruning.

Rose Bugs.

The present season has brought us a sad pest of rose bugs. Roses generally have been so much injured thereby as to prevent many persons from exhibiting at our yearly rose show for lack of Roses fit for the purpose. The rose bugs had entered in and taken possession. Every one naturally asks: "What is the remedy for this evil?" "What will bring dire destruction on rose bugs?" Of course, numerous ways of getting rid of them are put forth, among which I hear much in favor of turpentine, and especially of picking them off by hand. Yet I imagine many people this year give up the difficult problem in despair.

The Rocky Mountain Columbine.

One of the most beautiful flowers I have blooming in my grounds at present is the Rocky Mountain Columbine—Aquilegia cœrulea. Blue is always charming in flowers, partly, doubtless, from its novelty. The contrast in this case of the white petals with the blue calyx, renders the plant still more remarkable. Odd in form, like all Aquilegias, it seems to be one of the largest of the species, and is, indeed, a very uncommon flower. Remaining in bloom for weeks, it is suited to almost any spot; for it does not grow tall, and adapts itself to very ordinary soil. Indeed, it forms a worthy example of the positive value possessed by hardy herbaceous plants for permanent ornamentation of lawns. We want Geraniums and Coleuses, but do let us have as much variety as possible in our lawn effects. Bedding out plants surely do not make up the sum total of a lawn.

Field Crops.

CORN AND ITS CULTURE.

PROFESSOR A. E. BLUNT.

I am aware that people generally, if they have some extra-fine premium seed, are apt to overdo the thing trying to make it yield enormously. Perhaps it is not too late to give readers of the Rural a hint about corn and its culture.

In some localities there is as much danger of manuring too much as of manuring too little. Corn will not bear being surfeited. It will surely "founder," and grow nothing but stalks. Anybody can make stalks, but everybody cannot make grain. It is a difficult matter to draw that fine line between the manuring that makes stalk food and the manuring that makes the grain. Corn demands but a little wholesome food when properly given. As more than fifty per cent of corn is made up of carbohydrates, cellulose, etc.—the very elements every farmer has on his land—he should endeavor to fertilize his crop with a compost as nearly as possible like that which his corn, grain and stover will make when decomposed. It may be applied to the surface or plowed under. If old and well rotted, apply it to the surface and cultivate in. As no plants will take up green manure, great care should be

Pioneer.

taken in preparing a corn compost. The roots of corn are so delicate and fastidious—if I may use the word—that all plant food must be reduced to a hygroscopic—vapory—form before they will take it up; hence the necessity of exercising great care in manuring and cultivating corn. Highly concentrated commercial fertilizers may be of great benefit, if discretion is used in their application. The safest course for the farmer is to make and apply his own composts. In dry climates level is much better than hill culture. The soil retains moisture and the roots are not exposed.

My Improved Prolific Corn has been successfully raised in almost every State, and I hope the seed the Rural New-Yorker has sent out may be of great benefit to the farming community. In improving and bringing it up to its present reputation, I have endeavored to make as little stover and as much grain as possible. By selecting and saving the seed, by crossing, root pruning, by properly fertilizing and cultivating, the grain has been made much more abundant and better, and the stover smaller and finer. I shall persist in making it better still, if the Colorado climate will permit.

I hope every farmer will take pains to keep up his seed by selecting it in the field and by careful cultivation. As all seeds "run out" or deteriorate by careless selection and thriftless saving, manuring and cultivating, it behooves every one to institute a better system of culture. Put in less land and attend to it better. Put your brain-work and manure on a smaller acreage, and your hand-work will be less heavy, more satisfactory and more remunerative. I have four acres of my Prolific Corn planted. It is doing well. On one acre and a half I have 35 (24 pounds) varieties of spring wheat now nicely heading. I have already cultivated it twice. I also am testing 110 kinds of Irish potatoes.

State Ag. College, Fort Collins, Colorado.

Miscellaneous.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

Breeding for Sex.

We have received a number of letters from different parts of the country inquiring if anything can be done to regulate the sexes in breeding cattle.

There are several rules which have been practiced, but the exceptions attending their observance are almost, if not quite, equal to the successes; so that we are of the opinion that there is no infallible rule or system of breeding which will control the sexes. The latest theory is the so-called Stuyvesant, which is based upon the idea that every heat in cows is different, and that if the young is a male, at the next heat a female would be born if copulation should take place, and that at each heat there is an alteration of sexes. This system is too full of exceptions to be relied upon. Copulation at the beginning of the heat is said to produce more males, and at the moving off, more females. When the male is fed high and is in a lethargic condition, it is claimed that he will beget more female than male offsprings. Old bulls are preferred by some, for the same reason. Some cows will produce all heifer calves, and others all bulls, and some will alternate; so that it seems that the rule still holds good which tells us that "male and female created He them." Jersey cattle are more precocious than other breeds, and heifers often have young when less than two years old. They also have a larger proportion of males. Colors can be regulated, on the principle adopted by Laban, who produced cattle "ringed, streaked and speckled," by the streaked sticks set before them. A noted Jersey breeder, William Crozier, almost uniformly breeds cattle of solid color by placing a cow of this kind before the one to be copulated, and at the time of copulation.

The fact that females are worth twice as much as males, makes the subject of breeding for sex important to breeders of thoroughbred cattle, and the mystery connected with it makes it an interesting study. It seems as though there must be some general law, but it is as yet undiscovered.

Catalpa Trees.

Our catalpa seedlings were dead at the tops where the wood was soft and immature, but the main portions of the stems were healthy, and already they have grown a foot. As we are one degree north of where this tree is said to live and do well, we are watching our seedlings with a great deal of interest. Robert Douglas, the well known and successful tree man of the West, has sent us some of his Catalpas to test in our latitude (43 degrees). Mr. Douglas wants to test their hardiness before recommending them for general cultivation.

Poultry Care that Pays.

Our hens never did so well as during this season, and they never got such good care. With half the farmers their fowls cost them more than they get from them. They feed them just enough to keep them alive and to enable them to lay an egg now and then. When a dry time comes, very likely they do not have any water, and hens without water do not do well. They should have plenty of clean water always accessible. It is the extra feed an animal gets over and above what is required to sustain life, which makes the profit. With poultry it will make eggs in the season, and with all animals flesh, which is gain, and the gain is the profit.

Cutting Orchard-Grass.

To-day, June 10th, we have been cutting orchard-grass—Dactylis glomerata. It is just right now for excellent hay, but if left until timothy and other grasses are fit to cut, it would be spoiled. This is the principal reason why this grass is not liked by many. They are not ready to harvest it at the proper time, as they are unused to its prompt nature. In a week there will be a good bite of aftermath where we have cut the orchard-grass, and as often as it is eaten off there will be a renewal. In a dense shade it stood three feet high. It is the best grass for shaded places; hence the common name, Orchard-grass.

Keeping Qualities of Sorghum.

Esquire Davidson has proved the keeping qualities of sorghum syrup. Twenty years ago he put some syrup in a bottle and set it away. It was forgotten until now, when it was opened and found to be as sweet and good as when first made.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 29.—JUNE 13, 1879.

Fertilizer Analyses.

274. Stockbridge Tobacco Fertilizer. Sampled and sent by Charles Sanford, Roxbury, Ct., from a quantity purchased of agent and received from W. H. Bowker & Co., 3 Park Place, New York, May, 1878.

	Composition per 100 lbs.—per ton.		Guar. per ton.
Sol. Phos. Acid	.73	14.4	16
Rev. Phos. Acid	.71	14.2	
Insol. Phos. Acid	.27	5.4	
Potash * (as Sul'ate)	7.36	147.0	172
Chlorine	1.34		
Nitrogen as Am'nia	2.85	114.0	119
" of org'ic matter	2.85		

* Valued at 9 cents per pound

Estimated value per ton $40.94
Cost per ton 50.00

276. Dry Ground Fish. Made by Quinnipiac Fertilizer Co. Sampled by Experiment Station, May 26th, from stock of R. B. Bradley & Co., New Haven.

278. Dried Blood. Made by S. E. Merwin & Co., New Haven. Sampled by Experiment Station, May 26th, from stock of R. B. Bradley & Co.

285. Ivory Dust.

286. Buffalo-horn Dust.

285 and 286 were manufactured by F. S. Johnson, Blainville. Sampled and sent, May 29th, by Jacob W. Hemingway, Plainville.

STATION ANALYSES, &c.

	276	278	285	286
Nitrogen	8.18	7.21	5.28	14.44
Phos. Acid	6.40	8.88	24.65	
Est'd value of Fertilizer ℔ ton	$41.88	$41.27	$52.67	$43.32
" Nit'n ℔ lb.	.20	.20	.18	.15
" Phos. Acid ℔ lbs.	.07	.07	.07	
Cost Fertlizer ℔ ton	$40.00	$38.00	$30.00	$30.00
" Nitrogen ℔ lb.	.19	.17	.10	.10¼
" Phos. Acid ℔ lbs.	.07	.06	.04	

The considerable discrepancies between the estimated value and cost of 278, 285 and 286 are partly due to peculiarities of these articles, which affect the popular estimate of their agricultural value. Dried Blood is apt to prove "flashy" from its high state of division, while ivory dust and horn shavings are each perhaps the slowest of their class to become available, on account of the density of their structure. Blood is likely to give the best satisfaction when the weather that follows its application is either cool or wet or both, while if followed by hot weather it may spend too fast to be of much use, may indeed in large doses, injure the crop. Ivory dust, like bone generally, and horn are disappointing on dry light lands, and do best on moist and heavy soils, unless they are rotted somewhat, or fermented by composting with moist loam, or loam and ashes until they heat strongly, previous to application.

S. W. JOHNSON, Director.

CATALOGUES, &c., RECEIVED.

PLANT CATALOGUE from B. S. Williams of Victoria and Paradise Nurseries, Upper Holloway, London, England. This is a pamphlet of 128 pages, containing several fine wood cuts and a comprehensive list of Orchids, Ferns, Palms and general stove and greenhouse plants, and of new plants for 1879. Mr. Williams is a well-known author of several works on greenhouse plants, and their culture. He makes a specialty of choice plants, and brings every year numerous new and valuable plants to the notice of the public. The catalogue contains particularly a large and choice list of Orchids, Ferns and Lycopodiums, a class of plants that is sadly neglected in this country.

ILLINOIS INDUSTRIAL UNIVERSITY, Urbana, Ill., sends the University catalogue of faculty and students. It contains a full explanation of the various courses and the aims of the institution.

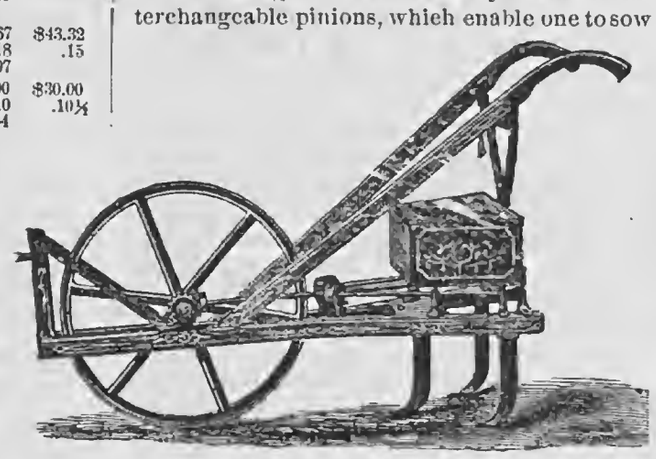
MR. J. E. CROW, Secretary of the Marion Co. (O.) Agl. Society, notifies us that there will be a public field trial of mowers and reapers this season under the auspices of his society. Particulars may be had by writing to him at Marion, O.

Industrial Implements.

A SMALL GRAIN DRILL.

A GOOD one-horse grain drill will find a welcome on hundreds of farms. We have had any number of inquiries concerning such an implement, and we, ourselves, were inconvenienced this season by the lack of such a help. We have lately seen one made by Mr. Ewald Over, of Indianapolis, Ind., which he calls the "Victor," and which seems to meet all requirements in this class of machines. We present an illustration.

The driving wheel connects by means of interchangeable pinions, which enable one to sow



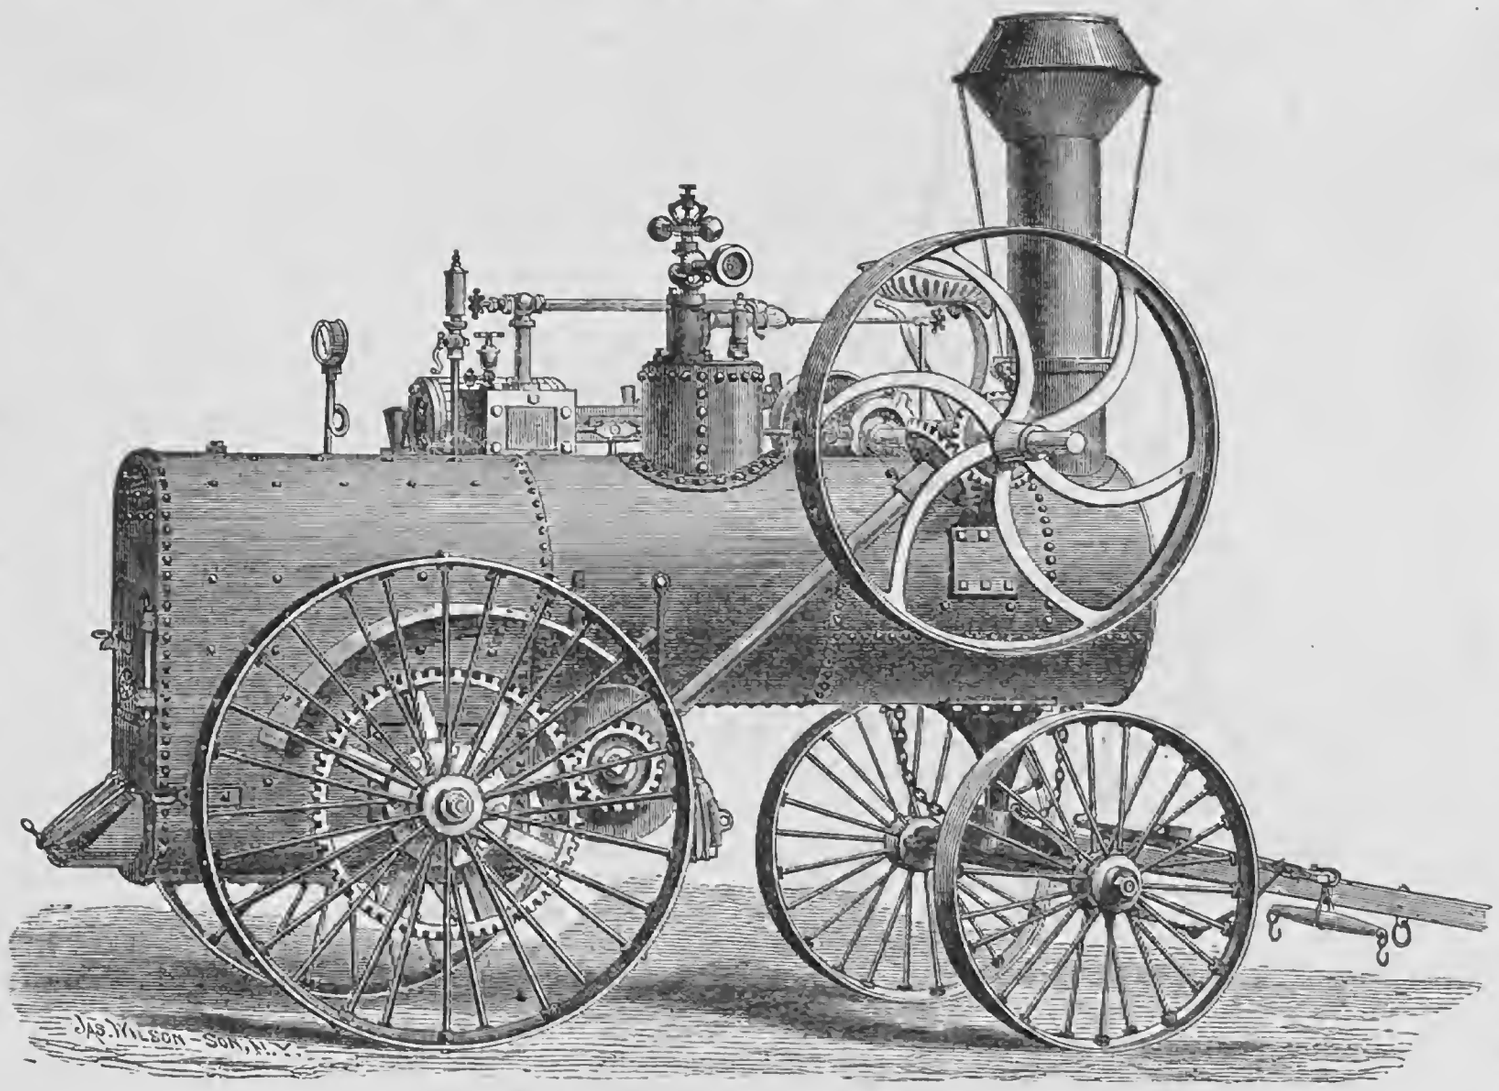
ONE-HORSE GRAIN DRILL.

either one, one and a quarter, or one and a half bushel of wheat to the acre, and a straight ½-inch square shaft into a nest of gears. These gears communicate the power to two other ½-inch square shafts, which convey the power to the force feed wheels, under the wooden feed box. The feed box is divided up into three compartments, one for each feed cup, securing a regular discharge of seed alike from all the cups, whether the ground be even or not. The left feed hole is provided with a cut-off, stopping the sowing of grain the second time of passing between the standing corn when it is wished to sow five drills between each row. A lever is placed under the feed box, by means of which the feed wheels can be thrown out of gear and thus stop sowing, whether the drive wheel moves or not.

The drill complete weighs only 85 to 90 pounds. It is simple in construction and very durable, and can be used for sowing wheat, rye, barley, small beans and oats (if not too bearded). Owing to its small dimensions and lightness, it is adapted to the most uneven ground. Circulars may be had on application.

A FARM ENGINE WITH TRACTION ATTACHMENT.

IN England traction engines are held in great esteem, and do much of the farm work relegated to horses in this country. Recently our manufacturers have, in some instances, improved their farm engines by adding traction attachments, and this week we give an example in the illustration of Russell & Co.'s farm engine, with such an attachment.



FARM ENGINE WITH TRACTION ATTACHMENT.

As originally planned, the attachment was expected to propel the engine only, but in practice it proves that the common plan is to couple the tank wagon to the boiler and the thrasher to this, and move all together. The speed attained on ordinary roads is about four miles per hour, increasing to six where roads are excellent. The horses having almost nothing to do, are always fresh, and come out at the end of the season in better condition, than when they began. The farmer has his thrashing done by steam power, yet has but one pair of horses to feed. In hilly countries the traction attachment has proved a great success, having a propelling power equal to more than four good horses.

The arrangement of this propelling device is very simple. Bevel wheels on the main shaft of engine, and on the inclined shaft of the attachment, transmit the power of the engine to the larger bevel wheel, this wheel moves a shaft which extends across the boiler. Spur pinions at each extremity engage in spur wheels which turn on the axle of truck. By suitable pawls and ratchets the power is transmitted to the truck wheels.

The gearing is so adjusted that the whole can be drawn by the horses, when the engine is not running, or propelled by the engine when in motion, without any change or shifting of gearing. A feather key with steel setscrew, permits of the traction gear being engaged or disengaged at pleasure.

The question will arise how is it possible to protect the crown sheet in descending long hills? In descending hills the damper is closed, steam shut off, and the brake and horses together are used in holding back. The agitation of the water in the boiler has been found to furnish ample protection to the crown sheet.

In stopping, however, the boiler should always be placed so nearly level that the crown sheet shall be covered. On long hills occasional stoppages should be made.

The throttle-valve may be controlled from the driver's seat as shown in the illustration. The engine made by this house is constructed with great care, and only the most excellent material used. Several minor improvements looking to the development of its power by the least expenditure of fuel will commend themselves to thrashermen. The firm write that orders have already been received for a large number of these engines. Circulars descriptive of both engine and attachment may be had on application to the firm at Massillon, Ohio.

AN INEXPENSIVE SPRINKLER.

WE have been using with good results at the RURAL farm a sprinkler sent us for trial by the Troy Stamping Works, of Troy, N. Y. It is a tin cylinder with perforations and a hole covered by a cap at one end, into which water and Paris-green are poured. The handle slides up and down the sides of the can in grooves at will. Carrying the can to the vines when filled, the perforated side is held uppermost. To operate, the can is turned over and the handle slipped along to the other end. By the operation of a well-known law, the contents of the can will not run out when held over the vines, except by a quick jerk up and down, when, with each motion, the plant is showered, and the operator steps to the next hill without wasting material between spaces. The constant agitation holds the poison in suspension, which secures even distribution. It is simple, cheap, effective and a very safe way of handling the poison.

THE Separator made by the Upton Mfg. Co., Battle Creek, Mich., is claimed to be a combination of the best features of the apron machines in connection with the leading features of the vibrating device, which are fully covered by patents granted to Mr. J. S Upton. The machine is marked by great simplicity, compactness and lightness of weight. Care has been taken to supply every labor-saving device that has been approved by practical tests in the field, and the construction has been planned with a view to making the Separator withstand the hardest service with the minimum of breakage. It is said to handle the grain very economically and to yield most satisfactory returns to both farmer and thrasherman. Now is the time to examine claims of such a character and our readers who are thrashermen by trade, should send for circulars, and go over the points more fully than we can in a newspaper mention.

Everywhere.

Continuation of Crop Reports.

LATEST FROM ALL SECTIONS.

Last Week's Reports Corroborated.

RAIN ALL OVER THE COUNTRY.

The Later the Reports the Better.

RURAL SPECIAL REPORTS.

WINTHROP, Kenn. Co., Maine.—There is more wheat sown here this year than has been for many years, and it is generally looking well. Maine is again getting to be quite a wheat-growing State. About the usual amount of corn was planted; but the cold, wet weather makes a good crop doubtful. There is a fair prospect for an average crop of potatoes. The apple blossoms were very abundant—uncommonly so for the "off year." Grass is not as good as last year. P. H. S.

BETHLEHEM, Litchfield Co., Conn.—The grass crop is our main crop, and it is looking very well. Rye takes the place of wheat with us, and it looks better than usual; it is not winter-killed as much as it commonly is. Corn is rather backward; about the average area has been planted. Potatoes are looking well, and more of them have been planted than last year. Apples are not very promising. Pears are better than last year. Small fruits are about an average. A. C. L.

SYRACUSE, Onondaga Co., N. Y.—The long drought appears to be over at last. For several days we have been having fine showers, and crops are greatly benefited thereby. From the present outlook, the grain crop in this county will be below the average, while hay must be light. Our wide-awake farmers will remedy this deficiency in a great measure by sowing corn, millet, etc. Strawberries are ripening slowly, and command a paying price (12½ cents), but in a few day we shall probably have a rush and a decline in price. The apple crop cannot be heavy. Of other kinds of fruit we shall have about the usual supply. N. R.

SANDUSKY, Erie Co., O.—The prospects for crops here are, as near as I can ascertain, as follows: wheat, corn and oats, good; grass, short, on account of dry weather in the early part of the season; potatoes promise a good yield; peaches on the Peninsula promise a larger yield than last year, but on the mainland they were winter-killed; grapes will be an average yield. T. F. H.

SOUTH BEND, St. Joseph Co., Ind.—The prospects for wheat here are good; for potatoes, good; for corn, rather discouraging with the exception of a few fields. The majority of the farmers had to replant. The wire- and cut-worms are playing havoc in many fields. Apples are one-fourth of a crop; pears, one-fourth; peaches, an entire failure; nearly all of the trees were killed by the preceding winter. Small fruits are in abundance. I am testing some of the newer sorts, such as the Lady, Brighton, Champion and Moore's Early Grapes; Sharpless, Glendale, G. American and Crescent Seedling Strawberries; and Gregg Raspberry. T. A. P.

LA FAYETTE, Tippecanoe Co., Ind.—The prospects for bountiful crops in this county were never better; the wheat is the largest acreage and the finest promise ever known in the county. The corn is backward, but the promise good and the acreage very large. The potato crop is very prosperous, the acreage, an average one. Fruits are not more than an average, perhaps below, on account of the severe winter. I have been over most of the county in person. D. R.

STERLING, Whiteside Co., Ill.—The prospects for crops in our county are that wheat and hay will be light; oats, barley and rye about an average; corn and potatoes never had any better appearance at this time. Although our orchards were loaded with blossoms, fruits will be scarce. J. H. B.

LAPEER, Lapeer Co., Mich.—We are having fine growing weather. Wheat looks splendid, and promises a very heavy crop. A large area of corn has been planted and looks fine—farmers are going through it the second time. Potatoes are large and nearly ready to blossom. In fact, there is everything to encourage the farmer. The hay crop is heavy, and will be ready for the mower by the 24th inst. Potato bugs are plentiful. Spring crops look well. R. R.

HART, Oceana Co., Mich.—The weather here is very dry. Wheat is short, but heading quite well. Corn is backward; we are just beginning to cultivate it. Oceana county will have a large crop of potatoes, if the season is favorable. Hay will be a poor crop generally. The reports on fruit have been good, still the frost, on the 6th inst., may have injured the crop in many places. Now the plum, peach, pear and cherry trees are loaded. D. W. C.

MATHERTON, Clinton Co., Mich.—The grain prospects in this section are quite favorable. Wheat is looking very well, although many pieces are not so heavy as last year. Clinton county will probably average from 15 to 20 bushels per acre. Corn and potatoes have been kept back by the dry weather, but promise a fair yield. The fruit crop will not exceed half that of last year. J. T.

UNIONVILLE, Tuscola Co., Mich.—Crops of all kinds are good, with a good fruit crop in prospect. R. A. T.

WEST SALEM, La Crosse Co., Wis.—We are having fine growing weather here now. Wheat looks well, but there has not been as much put in as formerly; more of what has been planted, is winter wheat than has been put in for a great many years. Most of it is the Odessa, which is also used as a spring wheat. There have been more corn and oats put in than usual, as farmers are turning their attention to stock raising. Clover is very heavy. Some have commenced to cut their hay, as a great many cut early on account of their desire to get seed. Potatoes are looking well; there are some bugs on them, but the pests have not hurt them any yet. On low lands fruit is not very plentiful; but on the high ridges it is better. We do not often have to thin out our fruit here. A great many think it cheaper to buy their fruit than to set trees and not have fruit once in three or four years. Small fruit is abundant. M. L. H.

WIOTA, Lafayette Co., Wis.—Corn, a good stand and promising. Wheat, more sowed than for several years, as but little has been raised here for some years, on account of chinch bug, which have now disappeared, as nearly as I can learn. It looks well. Oats, exceptionally good. Potatoes, less than usual planted, on account of scarcity of seed; promise well. Fruit, both wild and cultivated, will be abundant. W. F.

OSSEO, Trempealeau Co., Wis.—Wheat promises to be an abundant crop. Corn is steady. Oats are plentiful. Potatoes are, as usual, a good crop. Fruit is at the present at a standstill, owing to some frosts on the first of the month. Other crops are comparatively good. J. O. E.

INDEPENDENCE, Buchanan Co., Iowa.—Wheat and oats are about the same as last year, with less acres of wheat and more of oats. Corn is looking unusually well for this season of the year, and a larger area has been planted. Potatoes are not as good as last year, but more of them have been planted. There will be a fair crop of small fruit; not many apples are raised here as yet. The hay crop will be light. C. E. C.

SEDALIA, Pettis Co., Mo.—Wheat is a fair crop. We commenced cutting it this week. Corn is growing fine—we never had a better prospect for it. Potatoes are looking fine—Early Rose were fit for table ten days ago. There are no apples or peaches. Grapes promise well. We are having fine rains almost nightly. W. S. H.

FREMONT, Dodge Co., Neb.—The acreage of small grain in this and Saunders county has increased more than 20 per cent. over last year. The prospect for an abundant harvest of small grain at this date was never better at the corresponding period of former years. Wheat, oats and barley stand thick, and more clear of weeds than in former years. Corn is a thrifty and vigorous stand, and promises an exceptionally large yield. Fruit of all kinds had suffered some injury by the late frost that we had, but we expect fair average crops. T. I. E.

FORT COLLINS, Larimer Co., Col.—Owing to a dry May wheat is backward, and heading too early. A good crop is promised in most localities, however. Corn, though not yet sucessfully raised in this State, looks well and promises better than in former years. Ten years ago it could not be raised at all; now 40 to 60 bushels per acre are turned out. Potatoes on these plains are a failure; in the mountains, 1000 to 3000 feet higher and eight miles distant, they are a decided success—better in many respects than they are in the States. A. B. E.

OGDEN CITY, Weber Co., Utah.—Crop prospects in this section of Utah are above the average. This is true both of fruit and small grains, corn and potatoes, on land that is watered by irrigation; but on dry farms; that is, on land dependent on rain, the crops of small grain are mostly dried up; but even there corn and potatoes promise well, a heavy rain having fallen on the eighth, and another such a rain after a few days, will insure a crop of each even on dry farms. J. M. R.

EVERETT, Woodson Co., Kan.—Wheat in this county and part of Kansas, will average about two-thirds of a crop: early-sown wheat which was put in in good shape, will be a full crop, late and poorly sown wheat will be about one-half crop. The wheat was damaged slightly by the drought and frosts of March, and the present dry weather shortened the crop somewhat. Some have already harvested their wheat and the balance will probably be all harvested by the 21st. Oats will not be half a crop, owing to the drought and frosts of March and the very dry weather at the present time. Of corn I never saw better prospects for a full crop than we have at present writing. Corn, that was properly planted and has been well cultivated, stands three to four feet high, while fields that have been neglected do not, of course, look so well. Early potatoes made a splendid growth the fore part of the season, but, owing to the present dry weather, the early potato crop will be nearly a failure, unless we have heavy rains soon. Late potatoes were planted about two and three weeks ago, and it will depend on the coming weather whether we have a late crop or not. The fruit crop for this section and for nearly the whole State will not be worth mentioning. Peach trees are badly winter-killed and there will not be a bushel in the county where there were thousands last year. The apple and nearly all other fruits were damaged by the frosts of March, except a few orchards in high localities. I do not think there will be 50, or at the most, 100 bushels of apples in the whole county. Grapes, as far as I have seen, promise a full crop. We have not had any rain in this section for a month or more and, as a consequence, all gardens and some other things are looking wilted. J. J. D.

WASHINGTON, Washington Co., Kan.—Fall wheat is good; spring wheat is not so good, but will make an average crop. Corn never looked better—a good stand and growing finely. Potatoes look fine, and some are large enough for use. Apples, peaches and small fruits will be above average crops; wild fruits will be a large crop. The weather has been a little too dry until lately; but considerable rain has been falling. Health is good. J. V. B.

OTTAWA, Franklin Co., Kan.—Fall wheat is an average crop. Corn looks well, and has every appearance of a fine crop. The same can be said of potatoes. Apples will be half a crop. Peaches and pears are failures. Grapes will be half a crop. We have had a good season, and crops of every kind are in good condition. About half the wheat is harvested. W. H. C.

GARNETT, Anderson Co., Kan.—The prospects for wheat, corn and potatoes are good in this county. Fruit will be about half a crop. I. W. G.

EASTON, Talbot Co., Md.,—Wheat promises an average yield. It has not so large a growth as last season, but it is better filled. Corn, notwithstanding the cool and backward season, looks well; it is a good stand and has about the average acreage. Potatoes have made a good growth and ought to give a good yield, though the crop is not grown extensively here. Peaches, pears and small fruits promise to be abundant H. C. S.

ST. CLARA, Dodridge Co., W. Va.—We have fine growing weather now. The farmers in this section expect average crops. Most of them had to plant their corn the second time, owing to the frost having injured the first planting, but now it bids fair to do well. Potatoes are looking well; some have had early potatoes and green peas already. Our wheat will be short in straw, owing to dry weather; but will head well. Our fruit crop will be poor, owing to late frosts. Grass is not looking so well as a year ago. Owing to dry weather most of the farmers are working their corn the first time. Prices of produce here are low: corn, 50c. per bushel; Irish potatoes, 50c.; wheat, 70c.; eggs, 6c. per dozen; butter, 6@10c. per pound; cows, $20@$30, according to quality; young cattle, $10@$15; sheep, $2@$3 per head. S. W. W.

OWENSBORO, Daviess Co., Kentucky.—The corn crop of this section, although not as forward as usual at this season, yet looks well, and the prospect is good for an average yield. The wheat crop is the best and largest ever grown here. Harvest began on the 12th inst., and the yield will be 30 per cent. larger than the average crop. Potatoes are doing well. No peaches, and not a full yield of apples. J. M. A.

BLACK HAWK, Nicholas Co., Ky.—Much of the wheat crop of Kentucky will be harvested during the week ending on the 21st. Grain is good; the straw, short; it will average 12 bushels to the acre—not as many as last year, but the acreage will give as much wheat. Corn is a bad stand; fields spotted; from three inches to two feet high. Much has been replanted. With a good season from this out, it will make a fair crop. Potatoes show well for a large crop. Oats and timothy will be half crops. Blue-grass is not first-rate, but there will be enough for the demands upon it by cattle and horses. There is a light crop of strawberries. No raspberries or blackberries. All this applies to northern Kentucky. T. S. P.

ATHENS, McMinn Co., Tenn.—Our wheat will all be harvested on week ending June 21. Wheat was badly thinned out by the cold weather, but it is the heaviest-headed I ever saw here. I think the yield will be above an average. Wheat will start at $1 per bushel. The stand of corn is good; the yield will depend much on the season. Irish potatoes are not much raised here. Peaches are killed on low lands—plenty of them on high lands. Apples will be a light crop. Blackberries are ripening and will be very abundant. S. S. R.

GRIFFIN, Spalding Co., Ga.—Wheat in this section of Middle Georgia is nearly all harvested, and the thrashers are busy getting it out. Some say that the crop is twenty per cent. above an average. The highest yield is forty bushels per acre in different places. Farmers, however, estimate the average yield as varying from ten to fifteen bushels per acre. The quality is good, and its weight about sixty-two pounds to the bushel. The variety mostly grown is Purple Straw. The price of wheat at present is $1 per bushel. Strawberries are receiving considerable attention here, and, owing to the severe cold snap on the 4th of April, were nearly all killed. Monarch of the West is giving more than general satisfaction in this section. It stands cold and heat better than any variety I have ever tested, and I have tried more than twenty. It yields more, and the fruit is finer in size and better in quality. Great American is doing better this season than last, and may prove a valuable new variety with us. Corn is about an average in area planted, and is clean and well cultivated. It has a good color, and in some places is beginning to shoot and tassel. Price, 70c. per bushel. Oats were badly injured by freezing, and the crop will not be an average one. Price, clean, 65c. per bushel. Of Cotton there appears to be an increase in the acreage planted of at least five per cent. over last year. It came up well, is clean and well cultivated, and is now a good stand. There is no appearance as yet of worms. Price, 11½c. for middlings. Peaches and pears are almost an entire failure. Orchard Hill, six miles from here, where there are thirty thousand trees, has not shipped any fruit up to this time, that we have heard of. The Woodruff fruit farm lost nearly the entire crop of peaches and pears by the freeze on the 4th of April. Last year I was gathering fine ripe peaches from my early Beatrice trees, and some from Hale's Early, at this time; this year there is not a peach. The losses from this crop count by thousands, and will be severely felt by fruit-growers. Apples are hardly a factor in our fruit crop, and their loss will not be seriously felt. Irish Potatoes are an average yield, though smaller than usual in size, owing to a dry May—the time in which our earliest mature. My Beauty of Hebron are good in yield and quality, but not as large as Early Rose. The Early Rose is the hardier here of the two varieties; it stands the extremes of heat and cold better. Where Beauties were coming up, or just out of the ground, on April the 4th, they were killed so completely as to never come out, and one patch I had planted on an eastern exposure was totally lost, while one I had planted on a western slope did not get hurt, and were fit to eat May the 4th, and when the sun began to come down in summer style, and the thermometer went up to 89 deg. in the shade, May 24th, my Beauties wilted and the tops died outright, leaving me plenty of small potatoes of fine flavor which I intend to plant again about the 10th of July for a fall crop. The early Rose did not die down so in the hot days, and have made larger potatoes, but they are not so fine in flavor or so mealy as the Beauties. Labor is sufficient for the demands of the farmer, and hands never worked better or appeared better satisfied. There are no emigration agents here, and no exodus of the colored people. If we could avoid politics there would be no trouble among our laboring population. J. G. R.

TWIN LAKES, Orange Co., Fla.—No wheat is raised in this part of Florida, and only a very small amount of corn for local use. Sweet potatoes, too, are raised only for private use. This is an orange country. I don't think the prospect good for a large crop of these. Heavy winds blew off many oranges when quite small; what remains will be larger and finer, though. Thousands of young trees, just coming into bearing, may raise the crop to medium, or perhaps better. O. O. S.

GREENVILLE, Washington Co., Miss.—Corn, potatoes and fruit prospects are good. No wheat raised in this section. Cotton, catfish and blackberries are the main crops, and are good. Dewberries are all marketed at 10 cents per quart; the demand was greater than the supply. Weather, middling; mercury, 90° in the shade, with an upward tendency. E.

JUDSONIA, White Co., Ark.—This is not, strictly speaking, a grain-producing country. Wheat is turning out as well as usual. The prospects for good crops of corn, and also of potatoes, are quite promising. The chief productions of this section are cotton and fruit. The former bids well to be a fair yield, but the

latter, on account of the late frosts, will not be over a third of a crop. H. C. C.

HECKATOO, Lincoln Co., Ark.—Wheat, potatoes and fruits are not grown for market in this section. Corn is in the silk and tassel—but little is grown here save for home use. This is strictly a cotton district, though all the above-named grow and flourish well, and could be made a means of much profit. F. J. R.

DAYTON, Liberty Co., Texas.—Corn and cotton are one month backward. Crops look tolerably well. We had our first Voorhis watermelon yesterday, and the family pronounced it very good. The "Beauty of Hebron" succumbed to cut-worms—we did not save a potato. But the worst of all was the cattle breaking into my garden and destroying Blunt's corn. It grew so finely and gave me so much pleasure! I am surprised to learn that some are dissatisfied with their seeds. Such folks will grumble if ever they get to heaven. Thermometer in the nineties. G. G.

MCKINNEY, Collin Co., Tex.,—This is our eighth week without rain, being the 2nd drought for this season. Most of our wheat is stacked. The oat harvest is going on—not a very good crop. Cotton is looking well, considering that the weather is so exceedingly dry. These are the days that try seed farming in a scorching crucible. W. C. N. W.

CORNWALLIS, Kings Co., Nova Scotia.—The weather about the first of May was warm; but for a fortnight it has been cold for the season, and very dry. Crops look well considering the want of more warmth and rain. Some fields of winter wheat are very good; spring wheat and oats are well set, but suffering from lack of moisture and heat. Potatoes are coming up strongly. Grass is well set and forward. Apples are setting pretty well. Some fruits were injured by frost on the 27th ult. On the whole, farmers' prospects are good. C. C. H.

ORONO, Durham Co., Ontario, Canada.—The wheat crop generally could not appear better than at present, although a few farmers around here have found a grub at the root, and in some cases in the stalk, three or four inches from the ground. Potatoes and fruit of all kinds promise well. Corn is altogether behind, the weather being too cold for this crop on account of frequent cold showers. W. M.

[See page 416 for continuation of Crop Reports.]

The Querist.

ANSWERS TO CORRESPONDENTS.

Trees Suitable for Ornamental Lawn Planting in the South.

J. J. E., Luling, Caldwell Co., Texas, asks what trees would be suitable for ornamental planting on a lawn in that hot climate. Would Japanese Maple, Norway Spruce, Irish Juniper, Arbor-vitæ, Magnolia, Cape Jasmine be suitable. Last fall he put out a considerable number of trees and shrubs for the purpose of testing their adaptability to that section, but the spring was so exceptionally dry that nearly all of them died.

1. Tulip trees, any of the Southern Magnolias, Live Oaks, Buckeyes, Chestnuts, Catalpas, Silver Maples, Mimosa (Acacia Julibrissin), Paper Mulberries, BoxElder, etc., etc., may be used as shade trees; upright and horizontal Cypresses, Chinese Arbor-vitæ and its golden variety; Pittosporum Tobira, Retinospora obtusa and squarrosa, Privets, Japan Quinces, and the like, as evergreens; Althæas, double-flowering Almonds and Peaches, Forsythias, Deutzias, Mock-Oranges, Crape Myrtles, Lavender shrubs, Bridal Wreaths, and many others, as deciduous shrubs.

2. As regards Japanese Maples we have no proof to the contrary, nevertheless we do not recommend them; Irish Junipers and Norway Spruces will not do well; Chinese Arbor-vitæs do splendidly, but American Arbor-vitæs will not thrive; most kinds of evergreen and deciduous Magnolias—even the highly fragrant little banana shrub M. fuscata—do very well, their success mostly depending on the nature of the ground; Cape Jessamines are perfectly hardy at Luling.

3. If you were to utilize some of the multitude of handsome trees, shrubs, and herbaceous plants indigenous to Texas, you could have lovely gardens filled with most suitable material.

4. It would be unwise for us or our correspondents to recommend plants for use in localities where they have not been practically attested; we can suggest, however, and recommend for trial.

5. Many causes occasion failure, and in a dry soil and climate, newly set out plants have a hard battle to fight. But we recommend strong well rooted plants that have been once or twice transplanted before, making no avoidable delay between the time they leave the nursery and when they are set out on your place; plant them in December rather than later; pack the soil firmly around the roots at planting time and keep its surface loose during the summer; also apply a mulching of some open material, over the roots, for the first year, at any rate.

Treatment of Heifer with Sore Throat.

J. C. K., Fredericksburg, Va., has a three-months-old Alderney calf that breathes laboriously, with a rattling noise, apparently in the nostrils, just below the eyes. On pressing the gullet slightly, a trembling motion is felt, but no soreness is apparent. The eyes are somewhat dull and glaring. She feeds well, but does not thrive as well as his other young calves of the same breed. Occasionally she coughs as if there were some obstruction in the throat, and now and then her flanks heave, and he asks what ails her and how she should be treated.

ANS.—The heifer suffers from a sore throat; there is no symptom at present of any more serious disease; nevertheless, the inflammation may easily spread to the bronchial tubes and lungs and turn to bronchitis or pneumonia. The treatment should be active. Apply mustard paste to the throat where the unusual motion is felt, and rub it well into the skin. Wrap a woolen rag steeped in hot water around the throat afterwards. Give a small dose of Epsom salts, and afterwards one dram of saltpeter powdered fine and mixed with honey or molasses, to be placed in the back part of the tongue to be swallowed. If the cough increases, extend the mustard application to the lower part of the throat and the sides of the chest, and continue the saltpeter for two weeks, if necessary.

Sowing Seed for Permanent Pasture.

J. B. B., Miller's Station, Crawford Co., Pa., has four acres of ground he intends to put into wheat this fall. Wishing to seed it down to permanent pasture, he asks whether it will do to sow orchard-grass in the fall; what other kinds of grasses would it be advisable to sow with it, and how much of each.

ANS.—If the grass is of greater importance than the wheat, it might be better to abandon the latter and procure a certain catch of grass by seeding the ground at once, alone and without any other crop with it. This may be done by plowing and thoroughly harrowing the soil and sowing two bushels (25 lbs.) of orchard-grass, six pounds of timothy and six pounds of red clover per acre. This would give an excellent cover of grass and would furnish a cutting this fall and a pasture early in the spring, or a crop of hay early next June and pasture after it. If thought desirable, white turnips may be sown with the grass (two lbs. per acre), and these will give 300 bushels per acre in the fall, and will shade the grass and greatly help its successful growth. If wheat is desired, it should be sown about the middle of August, and the grass seed, above-mentioned, sown with it, leaving the clover to be sown in the spring. But this course would not pay nearly as well in the end as the former one, as the hay gained would be worth more than the wheat, and one year's time would be saved for the pasture.

Rose Chafers.

C. T., Millersville, O., sends us some beetles and asks for their name. He finds them on his corn which they, in some parts of the field, have badly damaged. He states that they have been in that locality three years.

ANS.—The insects are the Rose Chafers, Macrodactylus subspinosus. They have become serious pests to the grape growers of Michigan. Nothing seems to come amiss to them. Not only rose leaves, but the foliage of all fruit trees, together with many garden vegetables, all minister to their voracious appetites. The beetles are slim, ochre yellow in color, three-eighths of an inch long, and possess very long feet—especially long are the last or tarsal joints; hence the generic name Macrodactylus or long-finger beetle. Paris-green would quickly stay their work. It could be dusted or sprinkled on to the corn.

Cheat or Chess.

J. H. P., Cleveland, Tenn., asks whether cheat or chess will reproduce itself if left on the ground.

ANS.—Yes. The notion entertained by many farmers that chess grains will never grow, is just as erroneous as that other whimsey that wheat which has been injured by frost in the fall, or otherwise arrested in its growth, is liable to turn into chess. Often, however, the fallen seeds remain until the ground is broken up, or put in a favorable state for their development. The best preventive of this and similar troublesome pests in grain fields, is to sow none but good, clean seed.

Treatment of Butter that will not Gather.

H. K., Copper Hill, N. J., asks advice as to the treatment of butter that will not gather.

ANS.—When butter will not gather by churning in the usual way, the difficulty begins in the feed or health of the cow. This should be first looked after, and when corrected, gathering will be possible again. In cases where butter will not gather when the churning is properly done, the cream globules have been found to be largely composed of cells filled only with a watery scum in the place of being filled with fat. In other cases the globules are too small to churn, as when cows have been long in milk and are drying off. In such instances an improvement may be effected by an increase of unctious matter in the food, thereby increasing the size of the globules of cream. Heating the new milk to 130°, and cooling quickly, will greatly improve the gathering of butter from such milk. Butter also often fails to gather from being churned too cold, when warming must be the remedy. The cause, in any given case, should be studied to be successfully removed.

The Howell Pear.

A Reader, Brookline, Mass., asks for a distinctive description of the Howell Pear tree, as he is anxious to know whether he has one in his possession or not.

ANS.—Howell: Tree a vigorous grower; hardy; upright at first, spreading when in bearing state; young shoots reddish: an early and profuse bearer. Fruit medium, roundish; pyriform; light yellow, often shaded with red; many minute russet dots, and sometimes patches of russet. Stock medium to long; cavity small. Flesh whitish, juicy, melting, brisk, a little vinous. Quality good to very good, not best. Ripens in September and October.

Paris-Green.

E. O., Georgia, Vt., asks how to apply Paris-green, and if it is safe to use it.

ANS.—We have found Paris-green to be the most effective weapon against the potato beetle. It is applied in various ways. F. W. Devoe & Co., of New York, have issued a very complete treatise on the manner of applying Paris-green, that is replete with useful hints. Any farmer will find it interesting and instructive. It is sent free to applicants.

Miscellaneous.

M. A. C., Attica, Mich., desires to know what experiments we are performing at the Rural Farm. He tries all the new varieties of farm seed that he can procure, and he is at present experimenting with seven varieties of corn and sixteen varieties of potatoes.

ANS.—We have a great many experiments under way at the Rural Farm and the Rural Horticultural Grounds, too many to give an account of each at present. Reports of our experiments are given in the RURAL from time to time, whenever new facts worthy of notice are revealed. Our friend's interest in the progress of agriculture, as manifested by testing new varieties, is much to be commended. We shall be pleased to receive short reports of his experiments.

H. L. C.—no address—asks how long one should wait on an average for flower seed to come up before resowing?

ANS.—It depends entirely upon the nature of the seeds and the conditions under which they are placed. Ordinary vegetable and flower seeds ought to appear in from one to four weeks, if the weather is moist and warm. On the other hand, when the conditions are adverse to germination, seed may remain in the ground for months, and sometimes even years, and still germinate when circumstances become favorable.

E. N. D., N. Bennington, Vt. asks for a description of Hibiscus Syriacus.

ANS.—H. Syriacus is a hardy ornamental shrub, with wedge-ovate and three-lobed leaves and short-peduncled flowers in their axils. Flowers appear in autumn, and are about three inches broad and variously-colored.

E. Z. M.—no address—sends a leaf and flowerstalk of a plant, concerning which he has a dispute; he asks us to give its common and botanical names.

ANS.—Star of Bethlehem. (Ornithogalum umbellatum.)

The Apiarian.

HOW SHALL SECTIONS BE PUT ON HIVES?

REV. O. CLUTE.

WITHOUT denying that, under some circumstances, other receptacles for comb honey may be serviceable and desirable, I think it is generally conceded that the "prize section" is best adapted for the markets of the larger cities. It is probable that before many years have passed nearly all the comb honey that goes to market will be stored in this, or a very similar section. The method of putting the sections on the hives is a subject of a good deal of practical importance. There are three methods in somewhat wide use.

Those who use a honey-board over the frames often arrange and fasten the sections side by side, until they make a long box, glaze the open ends of this box, and place it on the honey-board, just in the way in which the old five-pound boxes are put on. For those who use a honey-board this method will answer, but for the large number who reject the honey-board it will not do.

Another method advocated by some excellent bee-keepers and used somewhat extensively, is to put the sections in cases, or holders, and to hang the cases in a super, just as a frame is hung in a hive. The super, filled with these cases of sections, is set on the hive, bringing the cases immediately over the brood chamber, with only a quarter-inch space between. At first this seems to be an excellent way. It is easy to arrange the sections in the cases, to hang the cases in the super, and to set the super on the hive. All is done in a few minutes, and everything is snug and tight. But from my own experience I am led to think there are two strong objections to this method.

First, it is not possible to examine easily how work is progressing in the sections. It is important for the bee-keeper to know this, and he needs to make frequent examinations. But by this method of placing sections, such examinations are difficult. Take off the lid of the super and you have only the tops of the cases to look down upon. You attempt to lift out one of these cases, but find that it is not easy work. If the cases have been shoved close together—as they ought to be—it is very probable that the bees have glued them together, so that they must be pried apart. Not unfrequently the bees have fastened the bottom bar of the case to the tops of the frames beneath it, so there is a still greater difficulty in removing it. Hence, by the time you have lifted out a case of sections, you have pretty thoroughly roused the bees and spent a good many minutes of valuable time. This difficulty of examining the sections when hung in cases, would, with me, be sufficient reason for rejecting this method.

But, secondly, there is another objection, equally strong. When you have lifted out your case of sections and find some of the sections filled and sealed, you want to remove these and replace them with new ones. As soon, now, as you attempt to remove these filled ones, you disturb others only partly filled, and you find yourself in the midst of a difficult and perplexing job, which requires more time and patience than it is profitable to bestow. Speaking only for myself and from my own experience, I am sure that this method of placing sections in cases and hanging the cases in supers is not the best method. If I were a prophet I would hazard the prediction that in a few years it will be entirely given up, except when a small amount of comb-honey is desired from the brood chamber. In this case there seems no better method than to hang the sections by the side of the brood combs.

The third method of placing the sections is to have a rack made for holding them, which sits closely over the tops of the frames, and holds the sections firmly in place; but by the removal of a wedge, allows the sections to be easily moved, and the filled ones to be taken out and replaced by others. By this method, when the sections are once in place in the rack, and the end sections in each row glazed, the rack can be instantly set over the frames, and there are then as many tight compartments for surplus honey as there are rows of sections, and these compartments come immediately above the brood. The progress of work can easily be known by lifting off the cap or super, and each section is easily reached and removed. This method seems to me far preferable to either of the others.

The sections should always come so close to the top bars of the frames beneath them as to leave only a passage way for the bees between, as this tends to prevent the building of bits of comb between the frames and sections, and the bees will enter the sections more readily when thus close. The fact that there is an entrance to the sections at both sides of every one of them, except the end ones in each row, has a marked influence to lead the bees to enter them and go to work in them.

SATURDAY, JUNE 28, 1879.

THE MARKETS FOR OUR SURPLUS CEREALS.

This week we pulish a large number of supplementary crop reports from various parts of the country. A few of them were received just as the last issue of the Rural was going to press, and the remainder have reached us daily since then. While furnishing fuller information with regard to the outlook for the next harvest, they do not materially alter the outcome of our last week's summary. The later, however, the date at which they were written, the more jubilant are the views the writers take of the crop prospects. Of late the weather nearly everywhere has been highly favorable to the farmers' hopes, and should it continue so for a few weeks longer, the prices of agricultural products, not their quantity, will alone be matters for anxiety. As there is but little doubt that the yield of our various crops will in the aggregate be at least as heavy this season as last, and as the home consumption cannot have been materially increased, our surplus for exportation will probably be fully as great from the present as from the preceding harvest. It is therefore a matter of no small importance to learn what are the prospects of crops in those countries whose agricultural products come into competition with our own in the markets of the world.

Throughout nearly the whole of Europe the past winter was the severest for the past twenty years; while the spring and early summer have been more backward than at any time within forty-two years. Violent storms of rain and wind have greatly injured all crops here and there throughout the British Isles and along the Atlantic coast of the Continent; while disastrous floods have desolated large areas of country in France, Italy and Austria. Although owing to the backwardness of the season and the unusual variability of the weather this year, it is as yet too early to form any definite opinion with regard to the crop prospects on the other side of the Atlantic; still it can readily be inferred from all reports from that quarter that the harvest will be considerably below an average in Great Britain and Italy; somewhat below in France and Austria; fair in Russia, our great competitor in wheat, and also in Spain and Portugal; much below the average in the wheat-growing regions along the Lower Danube, as well as in that granary of the ancient world, Egypt. Bismarck's measures for protecting home-raised agricultural products in Germany, by imposing a tax on all foreign imports, have stimulated the farmers of the Fatherland to unusual efforts; but there also the season has been so unfavorable that little if anything more than an average crop can be expected. On the whole, therefore, while the European consumption of cereals will be fully as great this year as last, the supply furnished from domestic resources will, most likely, be considerably less, and the market for our own surplus therefore be proportionately better.

Moreover, it is only within the past year or two that our wheat has found entrance into France, Spain and Italy, but in the absence of adverse legislation, it is more than probable that it has secured a permanent market in all these countries. A habit of importing grain once formed by any country can seldom be broken. Either foreign competition lessens the home production, or the low prices of the commodity and its consequent abundance induce a larger general consumption, or, instead of raising grain, the native farmers engage in fresh industries, the profits on which compensate the country for the national loss of money entailed by the importations.

This view of the European agricultural outlook has, doubtless, had some influence in holding the prices of wheat at the present high figures throughout the West. But, inasmuch as the speculative movement which has led to the present "bull" operations in wheat at Chicago, Milwaukee, and the tributary territories, was inaugurated a considerable time before any idea could be formed of what the coming trans-atlantic harvest would be, the high prices now ruling must be greatly due to the approaching culmination of the "corner" which Mr. Keene and his associates have been industriously forming since the beginning of the year. The vast amount of capital at the command of the combination, together with the extraordinarily low rates of freight to the seaboard it has obtained from the railroad companies, doubtless enables it to keep up prices temporarily, especially in view of the gloomy prospect across the water; but with the arrival of the new harvest in market, prices *must* sink, at least at the outset, so that it would probably not be unwise for those of our friends who are holding back grain, to unload during the present era of high figures.

A comparison of our own crop reports with those in our European "exchanges" is an abundant source of gladness and thankfulness. On the whole, our crop prospects are prosperous, our markets promising, our farmers buoyant. Of course, there are a few exceptions, but a perusal of our reports will bear us out in this statement. Our agricultural community is toiling manfully out of the slough of distress in which the nation has been floundering of late years, and bearing on its broad shoulders or dragging behind it the rest of the population. Well may our farmers be proud of the past and hopefnl of the future, and these sentiments frequently find unconscious expression in little "asides" in their reports. Across the water, on the other hand, whenever the farmer speaks of the outlook in his paper, he either grumbles, frets, or despairs. The whole agricultural world there is "out of joint," with no visible means of setting it right.

WHERE THE PROFIT COMES FROM.

Not many farmers know enough about the details of cost and expenditure in their own business, or bestow upon the subject sufficient study and thought, to know where the profit of farming comes from, or what direction their efforts should take in order to increase that profit. The philosophy of farming is little understood or written upon. Most of us stumble along, working by guess or "rule of thumb," without any clear comprehension of the elements with which we must deal in making the farm pay, far less with any real mastery over the elements.

We set it down as a principle, though few may accept it as such at first, that—unless for a short time upon new soil—a farmer's profits do not come from his land. It is very easy for a man to be "land-poor." That is what ails most farmers at this present time. If it were established as a law that every young farmer should begin with five on ten acres, and be allowed no more land until he had brought that to a high state of profitable productiveness, we should see very different farming from that which now surrounds us on every side. Land, indeed, is only valuable as it affords an opportunity to apply labor, and the accumulated product of labor—capital. Without these, land will yield no profit; and just in proportion as labor and capital are judiciously expended upon it, can land be made a means of adding to our wealth—that is, to "pay."

It is mainly for lack of the knowledge of this fact—or of faith in it—and for want of the practical knowledge how to act upon it, that farming fails to pay, or pays poorly. There is nothing that so thoroughly demonstrates a poor farmer as to hear one say he "cannot afford" to employ the labor or the money necessary for the thorough tillage and handling of his crops. One who thinks thus and can not be made to think differently, ought to quit farming,—and the quicker he quits it the better it will pay him.

It is pitiful to see how men act in these matters. They have not the least faith in honest dealing with the soil. Their effort is to cheat the land—cheat nature—out of a living. They have as little faith in the natural reward of good agriculture as sinners have in the spiritual reward of good moral culture. They fear to trust the soil to return them fair pay for good treatment. They fear that if they should properly manure and properly till a field, they would lose both manure and labor. Why is this timidity? Part of it, no doubt comes from conscious incapacity for the business in which they are engaged. But this is not always so. Men who are capable of raising large crops, and raising them with profit, will not habitually follow that kind of farming. Having done it once—having dared once to sufficiently fit a field for grain or roots or grass, and having received their reward, they seem to stand frightened at the result, to doubt its reality, to regard it as though it were a prize drawn in a lottery, an event of chance, that could not be relied on to repeat itself. It is sometimes two or three years before they summon courage to renew the experiment. Sometimes they never repeat it, but content themselves for the rest of their lives with telling about that big crop of corn or hay or potatoes they once raised.

Now, this is not farming. Farming is a legitimate business; not a hazardous speculation. We have a promise which can be relied upon that seed-time and harvest shall not fail, and a world-wide record of experience to show that the faithful, earnest labor of the husbandman is always rewarded. Either one or the other of two things upon the farm is true—that the labor, care and manure expended upon a crop to bring it to a high degree of perfection will pay, or that no less outlay of either will pay. If the use of one load of manure where there ought to be two, and of one day's work where there ought to be two, will pay a profit, the second load and the second day will pay a greater profit up to a certain limit. If it pays a man to put out his own labor on a piece of land, and that labor is not all the crop requires to perfect it, it will pay him still better to hire another man to help him. The second man's labor in such a case always pays better than the first's. If the result will not pay for both, it does not pay for either, and the first man ought to go at something else. And it is just the same of manure as of tillage, and just the same in the care and feeding of live stock. An insufficient expenditure in either of these directions is a wasteful, losing expenditure, whether it be of labor or of capital.

The greatest cause of this kind of bad farming is the possession of too much land in proportion to capital. A farmer cannot bring himself to reduce his land under tillage in proportion to his ability to supply manure and pay for labor, because he fears that he "cannot get a living from so little land." And here, as we began by saying, is the fundamental mistake. *We do not get our living from the land; we get it from the labor and capital laid out on the land.* This concentration of effort upon small areas of soil is something little understood in America. If it were, we should to-day see fewer mortgaged farms, and fewer sad-faced men and women toiling hopelessly upon them. From this point of view, we cannot but think it would be better if we had no legalized credit system in America. Then the young farmer could buy no more land than he could pay cash for, and would have to make the money from that before he could buy more. What a lesson this would be in economy and agriculture! What a revelation it would be of possibilities hitherto unbelieved in! What an opening it would be to many a young man who has in him the making of a good farmer, but who, buying more land than he can pay for, has all life and ambition and capacity for progress crushed out of him by the burden of an usurious debt. From a freeman with a freeman's spirit he is made a slave, and acquires the stolid thriftlessness of slavery.

PROBABLE DEVELOPMENT OF CHOICE ANIMALS.

The Ayrshire (Scotland) Agricultural Association holds an annual spring show for the exhibition of three-year-old cows. The entries for this show are made when the animals are calves, and out of one hundred and eighty-eight entries, eighty cows entered the ring the present season. This shows the proportion of animals which develop favorably to their owners' expectations. Of course no entries are made, or at least few owners go to that trouble and expense, except for such calves as promise, from the excellence of their dams or their pedigree, to become choice cows. The fact that less than half of the animals entered came to the show, proves that "although many be called yet few are chosen;" and probably the result is better than the average fruition of the hopes and expectations of breeders. Blood and breeding are great helps, but there are sports in animal life, as well as in vegetable, and it is not always that a sport perpetuates its special peculiarities.

Nevertheless, to know that out of one hundred and eighty-eight calves from choice cows, one-half hold out the promise of their breeding, is a sufficient proof that merit does not come by accident, and that the breeder's skill does raise the quality and value of the material upon which he exercises it. Besides, these eighty cows are the cream of the Ayrshire stock, and unless each was so excellent as to give hope of success, she would not have taken a place in the exhibition. Moreover, the fact that the first-prize cow of the year is full sister of the first cow of last year, is sufficient to prove that breeding is of value as a test of quality. Lastly, we are of opinion that the proportion of first quality of cows reared from a certain number of good calves, as shown in this example, has very rarely, if ever, been surpassed by any other breed, although some similar and conspicuous instances might be pointed out of excellence becoming hereditary in all well-bred animals.

TO YOUNG READERS.

We have been told by one who was quite successful as a city merchant, and who has been very successful as a farmer, that the average merchant, both clerk and proprietor, works much harder than the farmer. He says, "If the well-to-do farmer would educate his sons as well as does the well-to-do city merchant, they would lead far happier and more prosperous lives as farmers than as city merchants." And we have no doubt that it is so. Young girls and boys who read the Rural, we urge you to study hard to fit yourselves to be farmers and farmers' wives. Farming is susceptible of being the noblest pursuit of man. It is man who degrades it, and it is for you so to educate yourselves as first to appreciate the fact and then to assist in altering it to its highest sphere.

BREVITIES.

There is much less rust upon our cultivated wheat than upon that sown broadcast.

Roe's "Early Ruby" Gooseberry is now in bearing. The berries are half grown, and there is as yet no sign of mildew.

The Western Rural says that it has grown Prickly Comfrey for trial, and has not found an animal that would do more than smell of it.

Cows need exercise as well as men or any other animals. The practice therefore of soiling constantly in close quarters is evidently a bad one.

As fowls are usually kept by farmers, we think it will be found that the greater number of hens, the smaller the number of eggs from each hen in a given time.

Many thanks to many friends for the assistance they have offered in enabling us to present one of the most extensive and trustworthy crop reports ever presented by any American journal.

Mr. James Hogg tells us that 44 years ago, upon land that is now the northeast corner of 10th St., running up to 11th St., in this city, he saw Pearl Millet (Cat-tail) growing vigorously. The patch was about 25x100 feet. No, Pearl Millet is not a "new" plant!

Mr. I. K. Felch states in the American Cultivator that the superiority of the Light Brahmas has been conceded by three-fourths of the whole number now interested in poultry. Do the sales of eggs and fowls show that? If so or if not so, we place ourselves in the one-quarter minority.

Much less is gained by starting tomato plants in the house and setting them out about the middle of May than is by many supposed. Self-sown plants will often overtake them, prove healthier and bear better crops. About nine in ten set out tomato plants too early. The 1st of June is quite early enough.

Cold nights, impregnated with a dash of frost, have killed most of our squash vines which were just beginning to make rough leaves. For the same reason, corn has made little growth during the past week. A good deal planted late that had not made a growth of more than two or three inches, has been killed.

We have to-day (June 20) dug our first Beauty of Hebron potatoes. The largest of them measure about seven by six inches in circumference. They were planted late (the date has escaped us) and the season has been cold and backward. We shall welcome all reports of this variety, good, bad or indifferent. The specimens sent us from Mississippi are among the finest we have ever seen.

Farmers need not ever expect to have beautiful front gardens and lawns until they are willing to invest in lawn-mowers. The Philadelphia, Buckeye, New Excelsior and others, are first-rate machines, and with care will last for from three to five years, according to the amount of work they are called upon to perform. Any of them can be bought for from $15 to $25, and to those who appreciate a velvety lawn and a neat, bewitching garden, they will quickly pay for themselves.

In planting late cabbages, even though the ground is moist, it is best to twist off at least one-half of each leaf. If any one at this time will try the experiment of planting two rows, say of fifty plants each, in one of which the plants are set entire while in the other they are cut or twisted in two, he will be convinced that the trouble of the latter method is more than repaid by the results. These young leaves will die in any event, and they serve only to retard the establishment of the roots by exposing a larger evaporating surface than the roots can possibly supply with moisture.

How things come and go—among plants as among all things else! We are thinking of the beautiful "Tri-color Geraniums" that but a few years ago formed a considerable part of our greenhouse stocks, as well as our bedding plants. They were so beautiful that people would buy them or propagate them year after year in spite of failure upon failure as soon as exposed to the sun and hot winds of summer. Madame Pollock was among the first of these tri-colors, and it is strange that of the thousands since produced by cross-breeding or otherwise, this is still by far the best. But Mad. P., herself, is only fit for the greenhouse.

MISSES', BOYS' AND CHILDRENS' SUMMER STYLES.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

SO OPPORTUNE.

Down drooping to its nest of gold
The day a parting kiss bestows,
Far out upon the verdured fold
The splendor of its blessing glows.
The thrush within the orchard shades
Pours out the tribute of his heart,
And from the bracken ambuscades
The voiceful echoes gently start.

Almost the reign of peace is won;
The kine are at the oaken gate
Where, fondled by the waning sun,
The milkmaid's tender call they wait.
The kitchen door swings open wide,
An image treads across the sill,
And comes a voice like vernal tide
Of some o'er-freighted meadow rill—

"Ho! Brownie! Bossie! Bonnie Bess!
Come home from out your pastures bright,
Come take your mistress' kind caress
And give me of your wealth to-night!"
Then toward her fond-eyed lovers three,
A fairy maid, with tresses brown
And eyes like hue of starry sea,
Speeds lightly o'er the em'rald down.

She sees not, close beside the gate,
The farmer's bronzed and trusted son,
Whose honest eyes with joys elate
The fairy form are fixed upon.
She only sees the patient herd
That silent in the laneway stand,
That mutely wait her every word
And stretch their necks to kiss her hand.

"They say you have no heart," she said,
As Brownie's neck she fondly stroked,
And round the rugged throat of red
Her finely-molded arms are yoked.
"They say you have no heart, but oh!
You answer ev'ry sweet caress
With answers that do seem to glow
With Love's unspoken tenderness!"

"You cannot speak, you Brownie, dear,
But if your tongue could utterance know
You wouldn't wed your love with fear.
But let its fullest glory flow;
You wouldn't be as mute as he
That sees my love by silence bound,
That meets my glances tenderly,
Yet leaves my longings all uncrowned."

"You wouldn't hear me thus set free
My love, and let your heart to sleep,
But then—but then—if you were he,
I wouldn't dare to thus o'erleap
All modesty and break the spell
Of secrecy, as I do now;
But it's relief, e'en you to tell;
Oh! if he only were a cow!"

A scarcely noted fall of feet,
A hand was on her shoulder lain;
"I'll play I was, if you'll repeat
That pretty story o'er again,
With all its show of pettings too,
And that sweet noose about my throat,
There, little one, come, please to do!"
Perhaps there isn't need to note,

If word for word she o'er-confessed
The truth so innocently told,
Or whether 'twas considered best
To silent be, and seek the fold
That offered her its benefice,
But this we'll venture, anyhow,
The lips that left on hers a kiss,
Were not the chattels of a cow.

[*Wade Whipple in Quincy Modern Argosy.*

FASHION NOTES.

Ready Made Suits.

Those ladies who have deferred purchasing their summer outfit until now, are to be congratulated, for, in view of the approaching "close of the season," manufacturers are disposing of their stock at seductively low prices. Messrs. Lord & Taylor in particular seem determined to give their patrons the worth of their money, three and four times over. The reputation of the house is a guarantee that the goods will be as represented, (which is an important item,) while the prices asked for them are such as to make one marvel how, even in these times of cheap goods, any firm can afford to make such liberal offers.

Description of Cuts.

The central figure shows a misses' costume, composed of plaided and plain goods. Pattern of skirt is in six sizes for misses from 10 to 15 years. No. 6527, price 25 cents. The overskirt—No. 6569, price 20 cents—comes in eight sizes. The basque—No. 6570, price 25 cents—comes also in eight sizes.

Girls' costume, ornamented with embroidery. Price of pattern, 25 cents—No. 6565.

Boys' sailor costume. Yachting flannel is most commonly used in constructing this costume. The pantaloons pattern comes at 15 cents—No. 6469; the blouse at 20 cents—No. 6470.

Boys' costume, (shown in lower left-hand corner) of fancy cassimere, trimmed with velvet and braid. Pattern of pantaloons—No. 6498—price 15 cents; the vest pattern is No. 6496—price 15 cents; jacket pattern—No. 6497—price 25 cents. Cheviot, cassimere, flannel or summer cloth may be used.

Child's plain dress, (shown in lower right-hand corner.) This model is made of cambric and trimmed with lace-edged ruffles. No. of pattern, 6607; price 20 cents.

No. 6625. This costume is made of lawn and trimmed with Hamburg embroidery and ribbons. It may be made either high or low-necked, as shown in model. Price 25 cents.

No. 6596. Misses' deep round basque. These engravings illustrate a stylish basque for a miss. Price of pattern, 25 cents.

No. 6501. Boys' single-breasted coat. This model is desirable for cloth, diagonal, cassimere, Tricots, melton, cheviot, or any of the fashionable suitings for boys' wear, and machine stitching is quite as suitable a finish as binding for the edges. Farmer satin, alpaca or Silesia may be employed in lining the coat, and canvas or Wigan for stiffening the fronts.

No. 6569. Misses' over-skirt. The construction of this over-skirt is novel, without being at all complicated or difficult. All kinds of suitings worn by misses will be made up in this way, washable and woolen goods being equally popular for this mode. Price of pattern, 20 cents.

No. 6593. Girls' blouse. All kinds of seasonable textures will be made up in blouses of this style; white lawns, *piques*, jaconets and cambrics being particularly fashionable for waists to be worn over light or dark skirts. Price of pattern, 20 cents.

No. 6166. Misses' gathered blouse, with yoke. This model may be constructed of cashmere, merino, camels'-hair, bourette, or washable fabrics. If preferred, the blouse may be made altogether of plain goods. Price of pattern, 20 cents.

No. 6504. Boys' coat. Any material in use for boys' wear makes up stylishly by this model. Cost of pattern, 20 cents.

No. 6499. Boys' Suspender Pantaloons. The model used for this illustration is the most fashionable shape of the season, and will be chosen for all kinds of material. Price of pattern is 15 cents.

No. 6500. Boys' Single-breasted vest without a collar. This shape is a desirable one by which to make up washable goods, such as linen, Marseilles, duck, &c. Boys' suiting of any kind also makes up stylishly by this pattern. Price 15 cents.

No. 6697. Described above.

No. 6559. Girls' Costume. This pretty model is composed of pale blue Cashmere with trimmings of Torchon lace. A pleasing contrast may be brought out in a costume of this kind by making the center-fronts, the ornamental back-pieces, the pockets and pipings of pale blue and the remainder of navy-blue or *vice versa*. Deep plum and pale blue, dark garnet and primrose pink, dark green and cardinal or pale blue, seal brown and old gold, are also fashionable. Smyrna, Valenciennes, and all kinds of antique laces are fashionable trimmings for materials intended for girls' wear. Cambrics, lawns and *piques* are as much in vogue for children as at any previous season, and will be largely made up in this model. Price of pattern 25 cents.

No. 6600. Girls' Slip with Box-Plaited Ruffle. This slip has a loose body and the skirt consists of a deep box-plaited ruffle, whose joining seam is prettily concealed by a graceefully arranged scarf of blue ribbon. Any material may be used for it. Price of pattern, 20 cents.

No. 6620. Misses' Polonaise. This stylish pattern is a charming mode for fashioning organdies, calicoes, lawns, cambrics, and all sorts of cotton, silk and woolen dress goods. Price of pattern 25 cents.

No. 6526. Misses' Belted Polonaise. A polonaise of this style made of Swiss, lawn, *pique* or white goods of any kind, makes a very pretty and stylish over-dress to wear with a skirt of the same or of some contrasting fabric for holiday and gala occasions. The trimmings might consist of ruffles, lace or knife-plaitings of the goods. For ordinary wear, figured or plain colored fabrics are, of course, more serviceable. Price of pattern, 25 cents.

All of the foregoing patterns come in different sizes; when ordering be particular to state the age of the child. Faith Ripley.

Literary Miscellany.

AN UGLY GIRL.

(Continued from page 398.)

CHAPTER XXVII.

A SEANCE.

That evening, while he rested after his unwonted exertions, Herr Rudolsheim came to bear him company. He was received with unfeigned pleasure, for Noel never felt his loneliness so much as when the twilight came; for it was then that Illillian Gray had been wont to sit beside him, and with cheerful conversation, while the time away. Where was she now? Perhaps sullenly resenting his interference with Clement Dunforth, to whom he could not help fearing that she had listened more confidingly than he deserved. What would she say, if she knew that he was not in love, but in a cruel endeavor to make her betray herself, that the wily lawyer had been seeking her? The more Noel mused over Clement's avowal of his reasons for the attentions he had paid this young girl, the more angry and indignant he felt. It was base—it was unmanly! Such conduct might be considered excusable by a few members of the profession for which Irene's betrothed was qualifying himself; but it would never recommend itself to a man of good and honorable feelings.

Thinking this, it was only natural to revert to Mrs. Estcourts's too hasty acceptance of his proposal for her daughter. If Noel had found it difficult to reconcile himself to this marriage before he had obtained any insight to the character and feelings of Clement Dunforth, how much more so did it become when he found him entering so readily on a course of action which must end either in the disgrace or unhappiness of a helpless girl?

Dwelling on these painful topics had not elevated his spirits, and it was, therefore, quite a relief when the chatty, sociable German came in.

"If I intrude," he gaily said, "send me to the right-about; but just receive my credentials, shall I call this letter, which I bring you? Again has the fleet, noiseless messenger dropped one on my table, and astonished me by vanishing ere I could behold his or her form."

Then Miss Carlsforde had chosen to continue the correspondence, and, with an apology to the Herr, he hastened to peruse her epistle.

To his vexation it merely contained an entreaty that he would accept the stewardship of the estates, residing at the Park, and receiving such remuneration—if he still refused anything more—as her guardian judged it right to give him.

"You need have no hesitation on my account," she added; "as I am in treaty for a house by the sea, which will suit me far better than Carlsforde Park. If you are in earnest in your proffers of friendship, you will close with this offer, which I make with Mr. Blenkinsop's sanction. Let me have your decision by letter, or if you prefer it, address yourself to my guardian, with whom, of course, all the business details of this arrangement must be completed."

Then, as if by an after-thought, she had added: "Why do you wish to see me? Of what use would it be for me to listen to expressions of sympathy and good will, the sincerity of which your own conduct forces me to doubt?"

What did she mean by this? Noel could not accuse himself of an unkind thought towards his hapless cousin, nor could he recall a word uttered to anyone during his residence at the Park, which could be misconstrued. Yet it was plain that some one had slandered him to her, and that she credited the tale, else why did she refuse him an opportunity of justifying himself?

Yet, setting aside the annoyance this note cost him, his feelings towards Ada Carlsforde herself were only those of pity; in spite of her doubts, she was eager to serve him and his, and evidently thought that the plan she now proposed was one that he could agree to without his self-respect or his pride being wounded. It grieved him to disappoint her again, to frustrate such kind intentions; yet his determination to decline—gratefully but firmly decline—was already formed. On no pretense would he be induced to connive at her resignation of her rights; it would be unmanly, dishonorable, to do so, and he would never give anyone cause to call him either the one or the other.

In musing over these things, he had forgotten his visitor, until the Herr, in turning from the window, stumbled over an ottoman, and Noel, who had with difficulty deciphered the note, perceived that the room was almost in darkness.

"I will ring for lights," he said, with an exclamation of regret for his discourtesy.

"Nay, I pray that you will not," cried the Herr, who had found his way to a chair; "this obscurity relieves my eyes, which have been severely tesled to-day. I have been pouring over a manuscript, so faded, as to be scarcely legible, yet would I not lose a word of it, for the information it contains is priceless. Lord Carlsforde did a great work for posterity when he secured this precious tome. It is good to be rich, but to be wealthy and intelligent as well, is better. Truly, he was one of the most fortunate of men."

"And yet the daughter he leaves is one of the most unfortunate of women," observed Noel, unconsciously speaking his thoughts aloud,

"You think so? You have much pity for this *fraulein*, eh?" asked Herr Rudolsheim, abruptly.

"Certainly, I have. Who would not commiserate her?"

"But this is what you English call odd—no, *queer*; or, as I should say, inexplicable. You to speak thus, who have—our much-talking friend, Madam Hurst, assures me—refused, yes, refused, point blank, to make the young miss a happy bride! Pardon me, if I repeat that it is inexplicable!"

"Not at all, *mein Herr*," retorted Noel.

"Nor would you think so, if your informant had told you the whole truth, and nothing but the truth."

The Herr looked curious, and not choosing to hear his actions misconstrued on all sides, Noel went on to say:

"The late Viscount, by his will, gave me permission to woo his heiress; but he forgot that in leaving her the whole revenues of Carlsforde, he put it out of my power to do so honorably. Do you ask why? Because I was, and am a needy man."

"And the lady; have her feelings and wishes been consulted?" asked the Herr, as he helped himself to a pinch of the snuff he carried loose in his waistcoat-pocket.

"Not as much as they ought to have been!" Noel acknowledged. "I am afraid my own incautious speeches have been repeated to her, and have aggravated her keen sense of her uncomely appearance."

"And you despise—you reject her for her unhandsome visage?"

"By no means. Miss Carlsforde has proved herself so generous, so large-hearted, that I have long ceased to think whether she is ugly or pretty. But really, *mein Herr*, I am sick of discussing this subject. No one seems to understand that my objection to the marriage is simply: if I marry, it shall be for love, not for money."

"Why could you not have united the two?" asked the German, profoundly. "Is it not within the bounds of probability that this *fraulein*, this noble lady might, when you knew her intimately, prove to be endowed with so many charms of the mind, that you should love her for them? Aye, love her with that absorbing affection, enduring as it is respectful, ennobling the character of him who entertains it, giving him that 'something to live for,' which is needed to rouse the energy, to incite——But, bah! I prate too much and too fast. You are a man of sense; you comprehend already the advantages of wedding a woman who could appreciate you. Why, then, I ask do you not endeavor to learn whether in Miss Carlsforde this second soul is not to be found?"

"It is too late," said Noel, hastily; "nor, under the circumstances, could I have sought her with a view to our union. But I shall never cease to regret that I am leaving Carlsforde without seeing her."

"Why would you see the lady, if you are not prepared to make her the proposal of marriage?" the Herr inquired.

"Because she has contrived to prejudice herself against me, and thinks that my offers of friendship are made in a mocking mood instead of a serious one."

"Eh, well, the fault of that is hers."

"True; but think how peculiarly she is situated! She shrinks from the cold pity of the world—she has neither brother nor father to protect her. I cannot even feel certain that the one or two persons she believes to be her friends are worthy the name. How, then, can I go away—cherishing the deepest gratitude for her generous efforts to enrich me at her own expense—and not regret that her mistrust prevents me from proving that I would be as trusty, as true to her interest as her only living relative should be."

"See her, then, and tell her this. Speak to her as you have just spoken to me, and I think she must believe you."

"But, *mein Herr*, your advice, however good, is useless. The lady will not grant me an interview."

The German hummed the "Watch on the Rhine," and Noel was again on the point of ringing for Jephson, when Herr Rudolsheim's voice arrested him.

"My friend, are you believer or skeptic? Do you believe in the affinity of souls, or the vagaries of the spirits? Would you mock me if I asserted that by the exercise of my will I believe that I could bring Miss Carlsforde here? You are incredulous. I cannot see your face, but that exclamation tells me so. You think that I am boasting; and it is true that I have sometimes attempted this, and failed; but it is my firm conviction that I could, at this moment, so influence the *fraulein*, wherever she may be, that she should feel herself impelled to come hither and reply to our questions."

"If you are in earnest—" Noel began.

"If? Put me to the proof. Should I fail, laugh at me for a charlatan; should I succeed, then you shall admit, with your Shakspeare, that 'there are more things in heaven and earth than your philosophy dreamt of.' Are you ready?"—To be continued.

ABOUT POISONS.

Some Important Facts Which Ought to be Generally Known.

"Poison: A substance which when taken into the stomach, mixed with the blood, or applied to the skin or flesh, proves fatal or deleterious; anything infectious or malignant." Our scissors make the first clip out of Webster for a definition of the greatest evil as well as the greatest good known in the medical world. For after the fashion of the old saying, "It takes a thief to catch a thief," in public systems, so in the individual system if one poison has stolen away into the net-work of veins by fair means or foul, there is small hope of recovering one's own, save another poison be sent after it.

All medicines seem to be more or less poisonous. But owing to the large doses those classed "less" require to produce death or even deleterious effects, they are by the mass of people regarded as harmless, for arsenic, strychnine, opium, chloroform, mercury, and perhaps a few other prominent remedies cover all, to them, dangerous poisons. Yet we read in a daily paper of a child suddenly attacked by severe vomiting which the usual remedies failing to check, ends in exhaustion and death; and the cause is laid anywhere but at the confectioner's counter, where the boy bought his candies and cakes flavored with bitter almond.

"The bitter almond is a powerful poison." A single drop of the essential oil on a cat's tongue made a dead pussy of a living one in just five minutes, by experiment. Some delicate organizations, especially among children, can bear but little of this essence, the smallest quantity producing an eruption like nettle-rash, if nothing worse, and yet, macaroons are eaten and given to children to eat with impunity, while confectioners are often nowadays using, not the bitter almond, but the essential oil for their flavoring. There is a "family connection" between the bitter and sweet almond, how close is not easily defined, but sufficient to show that on some persons the sweet nut on our tables, if eaten, produces an effect similar to that caused by the bitter almond.

"Fish poison is one of the most singular in all the range of toxicology." Certain kinds of fish in hot countries are looked upon as always poisonous. Other kinds are only poisonous to peculiar constitutions, at certain times, and perhaps depending somewhat on the climate. The richer sort of vertebrate fish, though actually eaten with perfect safety by mankind in general, is nevertheless poisonous, either at all times or only occasionally to peculiar individuals. This fact is self-evident to many of us who have experienced nausea after eating white fish salmon, lobster, etc., at one time or another, and instinct is wise when it heeds the hint and declines the poison in future.

Lead poison we are more familiar with, as some members of our household are more susceptible than others to the injurious effect of water run through lead pipes. But the poison in this case, acting slowly and subtly, is usually classed under the broad, good-naturedly embracing term "malaria." Those who work in lead mines or in any way with lead, and absorb its fine dust into their systems, except by the greatest care, sooner or later have what in general phraseology is called printers' or painters' palsy. The habit of children to bite and wet their lead pencils is often followed by serious results, which are more likely to be traced to a close school room and hard study than to the lead pencils, slate pencils and chalk they have munched on at short intervals five days out of every seven.

Another of the every-day poisons is found in the syrup which is the leading feature of the American breakfast table. "The use of chloride of tin in glucose syrups has been proved by numerous analyses." Think of that, oh, ye who indulge in "golden drip" and "maple syrup" on cold, wintry mornings, on your hot cakes. Beware of any syrup that leaves a metallic taste in the mouth, lest by means of the sweet liquid your stomach gets a tin lining, and you, wondering why on earth you have developed dyspepsia, conclude that it must be the

hot cakes disagree with you. And if the said cakes are made of the raising—easy stuff called baking powder—very likely the disagreement can, in part, be laid to them, for analysis has also shown that baking powder contains a large proportion of desiccated alum.—*Journal of Materia Medica.*

UPON A STOLEN KISS.

Now gentle sleep hath closed up those eyes,
Which, waking, kept my boldest thoughts in awe;
And free access unto that sweet lip lies,
From whence I long the rosy breath to draw.
Methinks no wrong it were, if I should steal
From those two melting rubies one poor kiss;
None sees the theft that would the theft reveal,
Nor rob I her of aught that she can miss;
Nay, should I twenty kisses take away,
There would be little sign I would do so;
Why, then, should I this robbery delay?
O, she may wake, and therewith angry grow!
Well, if she do, I'll back restore that one,
And twenty hundred thousand more for loan.

[*George Wither*, 1500.

RESTAURANTS.

Many of our farmer friends who make only brief visits to large cities, do not, perhaps, realize what an important part the Restaurant enterprise bears in the interest of fine agriculture. There is not a more valuable means of distribution than these places afford. They form, in fact, a campaigning ground for the test of various products. They practically open an avenue of commerce that would prove tedious if the introduction and trial of many commodities had to be gained simply by the slow process of family demand.

Regular residents have been, as a rule, accustomed and satisfied with garden and orchard items in their season; restaurants help greatly to vary this feeling. Besides, in this age of railroads and steamcraft, a miscellaneous congregation of consumers is at all times, to be found in large cities, numerous enough to develop a demand for table-supplies that remind them of home specialties.

Hence, there is an eager spirit of competition aroused among managers of hotels and first-class restaurants, aiming to render their guests contented. With this point gained, another follows: Many busy regular residents choose, or are forced to lunch away from their own tables, and another tributary to increased demand is thus loosened.

Good livers are not slow in taking hints from reputable restaurants in matters of *cuisine*, while they also avail themselves of the bulletins of novelties in market furnished by public lunch-rooms. Of course, we refer to the well-to-do rank and file of citizens. The time was, and not very remote either, when only an opulent few could enjoy expensive hot-house fruit and vegetables. Now, with the enlarged garden culture of the South and judicious selection of varieties in other parts of the country, products that once rated as luxuries have expanded into crop significance.

As this is the case, it is evident how important it is to have the assurance of steady sales, if the grower is to be encouraged and compensated. Restaurants largely effect this; their bills of fare must be underlined so as to make almost a continuous season for many things. There must be Strawberries before May! Ripe Peaches many weeks in advance of Maryland pickings! Green Peas and Asparagus before the frost is out of the ground hereabouts; New Potatoes long before the Fourth of July—a date once regarded as almost miraculous in this section. Apples, Pears, small fruits, Cucumbers, Cabbages, Kale, Spinach and Lettuce, are all stock affairs, weeks and weeks sooner than near by supplies can be obtained. In fact, the market frequently displays the green and tinted splendor of late summer while its patrons are yet winter-clad.

These allusions to the help given by purveyors, must be gratifying to pains-taking producers, as it is pleasant to know that outlet for their labors is widening every new season, and in nearly every case, steady success is promised for what was at one time timid experiments. T. A. G.

Mary had a little lamb,
Its fleas were black as night;
And everywhere that Mary went
Those wicked fleas would bite.

[*Mrs. Hemans.*

PAINTING FLOWERS UPON MIRRORS.

An art revived in Rome within three years past, is the old Venetian art of painting flowers upon mirrors. Birds and butterflies are often added, and the effect of the glass underneath, especially when that is thick and bevelled, is to make them appear as if suspended in air. Tourists remember seeing them in Venetian palaces, but faded and flecked with time, and often also, coarse and heavy in design. To-day the execution is much finer, and besides, our flowers are enriched in quality and variety. Fornari is the best artist for this work in Rome. His flowers are poised and painted with a grace and delicacy that nature, so reluctant to give up her subtle secrets, has herself granted him. This would be a pleasant study for the amateur artists who are springing up all over the United States, like wild flowers in the spring. The design must be traced from natural flowers with a lithographic pencil, and painted in oils with peculiar care, for nothing can be more unlovely when badly done with muddy, ill-assorted colors. These mirrors are usually framed in carved ebony or ebonized frames in the cinque cento style, another fashion revived within a few years. In the house of Arsene Houssaye in Paris, and in some others, the glass of the windows is similarly decorated. One or two centuries ago, it was a fashion to cover the entire walls of boudoirs with bellowered mirrors. One of the prettiest is in the "Favorite" Palace at Baden Baden. Thus do we travel in circles. Art as well as History always repeating its traditionary steps.—*Syracuse Journal.*

RECENT LITERATURE.

"How to Grow Handsome; or, Hints toward Physical Perfection, and the Philosophy of Human Beauty," showing how to acquire and retain bodily symmetry, health and vigor, secure long life, and avoid the infirmities and deformities of age. By D. G. Jacques, author of "The Temperaments," etc. With introduction by Editor of Phrenological Journal. New edition. Illustrated, 12mo. Extra cloth, price $1.00. New York: S. R. Wells & Co.

This is a very valuable book on the subject of physical culture, and especially a work for ladies, but of interest and importance to all, and may be recommended to mothers.

The work is very extensively illustrated with fine plates, consisting of upwards of one hundred illustrations, taking up and elucidating distinctly the structure of the human body, including in brief, a system of anatomy and physiology. The perfect man and woman are held up to view with the contrasts which are found between the two sexes Our author briefly discusses here the temperaments, with illustrations, also the laws of configuration, showing the effects of education, culture, etc. A very important chapter is that on embryology or heredity, showing that conditions are transmissible, with important rules to be observed. Childhood and the culture which should accompany it is amply set forth, the relations to body and brain, the moral and emotional influences as affecting beauty, the influences of the fine arts, social conditions, and occupations with the various causes of deterioration, the effects of climate and locality. Then comes the department of direct physical culture, including proper positions, for sleeping, sitting, standing, walking, running, skating, riding, swimming, rowing, dancing, gymnastic exercises, and all of the best means of physical culture, with directions for remedying the defects usually found. Practical hygiene shows how air becomes impure, the abuses of the stomach, what to eat and what to drink, rules for diet, exercise and rest, cleanliness, etc. A chapter devoted to womanhood contains a strong word for mothers and the marriage relations. The secrets of longevity show the perils of life, what constitutes vital power, human capacity for life, or how long we may live, etc. Dress is discussed, with hints on colors, ornaments, etc. The work closes with the external indications of figure, and a complete index.

The Gospel of Joy.—By Rev. Samuel Alman and S. H. Peck. Boston, Oliver Ditson & Co.

The title page informs us that this attractive collection is for Gospel Meetings, Camp Meetings, and Sunday Schools. Its superiority in character to some former compilations will be sufficiently indicated by several extracts from the preface. "We call special attention to the large number of hymns and tunes that have never before been published." There are nearly eighty of these. "Our aim has been to present such hymns only as contain Gospel Truth; and which are themselves short sermons on given texts." The title first selected was, the Gospel in Song, a most appropriate one; but it was abandoned for the reason that it somewhat resembled the name of another book. "We have striven to avoid the too prevalent dancing style of the so-called sacred music of the present day, and we believe that in our effort to correct this abuse, many will give us their approbation." In so doing, the authors have by no means fallen into the opposite error of producing a dull book. The melodies are unusually bright and musical. "We have also inserted a choice collection of old favorites." No singing book is complete without these, but they occupy only a few pages, and are very well selected. The Gospel of Joy contains 135 Hymns, and about 120 Tunes, all of which are pleasing, and the bright book, with it bright name, can hardly fail to be a great success.

Light in Dark Places; or, How the Camps Lived in their Poverty. By Henry S. Drayton. With illustrations. 12mo, pp. 275, cloth. Price, $1.25. Philadelphia: Claxton, Remsen & Haffelfinger. New York: S. R. Wells & Co.

Some books are written for one purpose, some for another. In one we find a story merely, the author having drawn on his imagination for a plot and exercised his ingenuity in creating novel characters and unexpected incidents. In another there seems to be a desire to argue some point, teach some lesson or advance some theory, and the story, if it may be called such, is subservient. In the book named above, the author seems to have attained the true position of a story-writer. He amuses and instructs at the same time. His recital is of a family in needy circumstances, and his teaching is in showing how they managed to live comfortably on a small income and brought happiness to themselves by conferring benefits on those about them. Without turning aside from the course of the story or detracting from its interest, he manages to introduce brief but instructive lessons on domestic economy, hygiene, cookery, physiology, dress, deportment, etc., so naturally that the reader scarcely suspects he is the recipient of instruction.

Important Transfer of Hymn Book Interests.—Messrs. Scribner & Co., having, under the business management of Mr. Roswell Smith, brought the publishing of Magazines from doubtful experiment to an unparalleled success, have now entered a new field with characteristic energy in the publication of Hymn and Tune Books for churches.

Their recent issue of "Spiritual Songs" by Dr. Chas. S. Robinson, and "Calvary Selection of Spiritual Songs" (for Baptist Churches) by Dr. Robinson and Rev. Robert S. MacArthur, in beautiful style, at very moderate prices, met with universal commendation from the critics. And now comes the announcement that the plates and copyrights of "Songs for the Sanctuary," and all Dr. Robinson's other works, have been purchased by this house from A. S. Barnes & Co.

By this transfer, the works of the most successful compiler of hymn and tune books are consolidated in the hands of a firm which has ample facilities for bringing them out in the very best form at the lowest possible prices.

Dr. Robinson's earlier works, especially the popular "Songs for the Sanctuary," in its various editions, are used in more churches than all other similar collections put together, and yet it is said that the entire income received by Dr. Robinson from his Hymn Books for the past sixteen years has been given back to the churches in various ways for the cause of Christianity.

MAGAZINES.

Atlantic Monthly for July: Massy Sprague's Daughter; Glamour, Wm. O. Bates; Public Balls in New York; The People for whom Shakespeare Wrote. II., Charles Dudley Warner; Recent Modifications in Sanitary Drainage, George E. Waring, Jr.; Juno Ludovisi, Hjalmar Hjorth Boyesen; Irene the Missionary. XIV.-XVI.; The Morning Hills, Maurice Thompson; Our Commerce with Cuba, Porto Rico and Mexico, C. C. Andrews; The Children Out-of-Doors, John James Platt; A Fossil from the Tertiary, Edward E. Hale; Avalanche, H. H.; English Skies, Richard Grant White; The Contributors' Club—Schoff's Engraving of Rowse's Emerson—Men's Women and Women's Women—Over-Production and its Remedy—A Protest on behalf of the Friends and Relatives of Authors—Non-Pecuniary Rewards of Literature—Unreligion of Recent Novels. Recent Literature—Bartlett's From Egypt to Palestine—Burroughs's Locusts and Wild Honey—Motley's The Rise of the Dutch Republic—Paul's Mary Wollstonecraft—Bacon's A Life Worth Living—Pike's The New Puritan: New England Two Hundred Years Ago—A History of the Witches of Renfrewshire. Education—Reports of the Superintendent of Boston Schools.

The People for Whom Shakespeare Wrote.—In nothing was the increasing wealth and extravagance of the period more shown than in apparel. And in it we are able to study the origin of the present English taste for the juxtaposition of striking and uncomplementary colors. In Coryat's Crudities, 1611, we have an Englishman's contrast of the dress of the Venetians and the English. The Venetians adhered, without change, to their decent fashion, a thousand years old, wearing usually black: the slender doublet made close to the body, without much quilting; the long hose plain, the jerkin also black,—but all of the most costly stuffs Christendom can furnish, satins and taffeties, garnished with the best lace. Gravity and good taste characterized their apparel. "In both these things," says Coryat, "they differ much from us Englishmen. For whereas they have but one color, we use many more than are in the rainbow, all the most light, garish, and unseemly colors that are in the world. Also for fashion we are much inferior to them. For we wear more fantastical fashions than any nation under the sun doth, the French only excepted." On festival days, in processions, the senators wore crimson damask gowns, with flaps of crimson velvet cast over their left shoulders; and the Venetian knights differed from the other gentlemen, for under their black damask gowns, with long sleeves, they wore red apparel, red silk stockings, and red pantofles.

Andrew Boord, in 1547, attempting to describe the fashions of his countrymen, gave up the effort in sheer despair over the variety and fickleness of costume, and drew a naked man with a pair of shears in one hand and a piece of cloth in the other, to the end that he should shape his apparel as he himself liked; and this he called an Englishman. Even the gentle Harrison finds it easier to inveigh against the enormity, the fickleness, and the fantasticality of the English attire than to describe it. So unstable is the fashion, he says, that to-day the Spanish guise is in favor; to-morrow the French toys are most fine and delectable; then the high German apparel is the go; next the Turkish manner is best liked, the Morisco gowns, the Barbary sleeves, and the short French breeches; in a word, "except it were a dog in a doublet, you shall not see any so disguised as are my countrymen in England."

This fantastical folly was in all degrees, from the courtier down to the carter. "It is a world to see the costliness and the curiosity, the excess and the vanity, the pomp and the bravery, the change and the variety, and finally the fickleness and the folly that is in all degrees; insomuch that nothing is more constant in England than inconstancy of attire. So much cost upon the body, so little upon souls; how many suits of apparel hath the one, or how little furniture hath the other!" And how men and women worry the poor tailors, with endless fittings and sending back of garments, and trying on! "Then must the long seams of our hose be set with a plumb line, then we puff, then we blow, and finally sweat till we drop, that our clothes may stand well upon us."

The barbers were as cunning in variety as the tailors. Sometimes the head was polled; sometimes the hair was curled, and then suffered to grow long like a woman's locks, and many times cut off, above or under the ears, round as by a wooden dish. And so with the beards: some shaved from the chin, like the Turks; some cut short, like the beard of the Marquis Otto; some made round, like a rubbing brush; some peaked, others grown long. If a man have a lean face, the Marquis Otto's cut makes it broad; if it be platter-like the long, slender beard makes it seem narrow; "if he be weasel-beaked, then much hair left on the cheeks will make the owner look big like a bowdled hen, and so grim as a goose." Some courageous gentlemen wore in their ears rings of gold and stones, to improve God's work, which was otherwise set off by monstrous quilted and stuffed doublets, that puffed out the figure like a barrel.—*Atlantic for July.*

Harper's Magazine for July.—Narragansett Pier, Prof. Charles Carroll, with fifteen illustrations; The Owl Critic, a Poem, James T. Fields, with two illustrations; The Land o' Burns, William H. Rideing, with fifteen illustrations; The Mowing, a Poem, S. H. M. Byers, with one illustration; A Peninsular Canaan, III. Delaware, Howard Pyle, with nineteen illustrations; The Happy Island, a Story, Edward Everett Hale; A Romance of East Hampton, A. A. Hayes, Jr., with three illustrations; The Storming of Stony Point, H. P. Johnston, with three illustrations; Fifty Years of American Art, I., S. G. W. Benjamin, with thirteen illustrations; Young Mrs. Jardine, Dinah M. Craik, with three illustrations; Recollections of Charles Sumner, E. P. Whipple; The Diary of a Man of Fifty, a Story, Henry James, Jr.

Beaconsfield and Peel.—The alleged growth of the influence of the crown is coincident with a great increase of the court circle by the marriages of the various members of the royal family, so that the court influence in politics becomes more and more evident. A recent incident shows the condition of the public mind in England, and the risks of the Beaconsfield policy. Sir Robert Peel spoke severely in the House of Commons of the Queen's correspondence with Lord Chelmsford, and alluded to Thackeray's unflattering portraits of the Georges, one of whom, and the most reactionary, was the Queen's grandfather. Presently a friend of the Prince of Wales intimated, in a paper called *Vanity Fair*, that the royal family intended to cut Sir Robert. To this foolish assertion Sir Robert replied, in a letter which the editor of *Vanity Fair* begged him to withdraw, and which was privately shown to the Prince of Wales, who caused Sir Robert to be informed that he had not authorized the statement in *Vanity Fair*. This message Sir Robert sent to the *Times*, and the editor of *Vanity Fair* retorted by publishing Sir Robert's letter. It is a letter in which, courtward and Queenward, Sir Robert uses very strong language, calling the statement of *Vanity Fair* "a very impudent expression of the latest development of the ridiculous imperialism of the present day;" "a clear breach of privilege, recalling the most stupid exhibitions of royal misconduct." "You invite me to a game which two can play at: one of the parties in the contest may prove a pungent critic of the coming K—— and Co." "You act as the plenipotentiary of royalty: go and tell your master that I am not the sort of man to be smothered by imperial menaces, and unless I receive the most ample satisfaction from the royal sources which have made you their most impudent mouth-piece, I shall send a copy of your statement, together with my reply, to the Prince of Wales and the Duke of Cambridge."

This is "langwidge" which even James Yellowplush could not mistake, and the courteous disclaimer of the Prince, which did not prevent its final publication, can not change the conviction that there is very deep and strong feeling when a man of the position of Sir Robert Peel, who is by no means a radical, can write in such terms of the court for publication, and when another staid and substantial Commoner can propose a virtual censure upon the Queen. It is not a favorable moment for attempting to magnify personal monarchical power, and the course of events in England shows how singularly out of tune with his own age the Prime Minister is. When he was made Chancellor, a few years since, he exhorted the students to study carefully the spirit of their age, and to conform their lives to it: and by way of illustration he chooses the time in which the idea of monarchy is outgrown among the educated and intelligent classes who inspire and control the age, and in a country traditionally sensitive to the encroachment of prerogative, and in the prospect of the succession of a Prince who is thought too much to resemble his great-uncle the Prince Regent, to revive personal government, to enhance the power of the crown, and to belittle Parliament. There is, indeed, in the opinion of shrewd observers, a reaction upon the Continent against free government. But that is impossible in England. The country has gone too far forward; the suffrage is too widely extended; there is too much real liberty and soundness of thought, too homogeneous a people, too sturdy a national character, to permit any such reaction. There is nothing in the purpose of Lord Beaconsfield which can contend successfully with the spirit of Sir Robert Peel.—*Editor's Easy-Chair, in Harper's Magazine for July.*

The Twenty-fourth Annual Commencement exercises at St. Mary's Academy, Notre Dame, Indiana, promise to be very pretty. The programme sent us, clearly indicates the high standard demanded of the scholars. Mother Mary of St. Angela, the Superior, may well feel gratified at the success attending her efforts to make St. Mary's one of the best schools in the country.

CROP REPORTS.

(Continued from page 411.)

BOLSTERS MILLS, Cumberland Co., Maine.—The weather is cold and wet and everything is backward. Wheat is looking fair. Corn is just coming up, but looks yellow. What potatoes are up, are looking well, but the beetles are very plentiful. The fruit crop isn't started, so that we cannot tell how it will turn out. Small fruit, however, will be quite abundant. All kinds blossomed full. We had a heavy frost on the 8th and it did some damage. R. S. P.

HAVERHILL, Grafton Co., N. H.—Wheat, corn, and potatoes are looking finely, notwithstanding the lateness of the season. Perhaps we may expect average crops. Grass never looked better. Fruit has been injured a good deal. The potato bug has put in an appearance; but what the result will be remains to be seen, as the season advances. H. H. B.

CORNWALL, Addison Co., Vt.—It was very dry here until about the first of June; we have had considerable rain since then. I think hay will be about half a crop. Winter wheat is very good; spring wheat and oats are rather below an average crop. The prospect is good for a great quantity of fruit. Potato beetles are plentiful. Market prices are very low—good butter brings only fourteen cents. W. M. E.

HARWINTON, Litchfield Co., Conn.—Some farmers planted corn in May, as we had a few warm days; it came up well, but a frost on the last of the month cut most of it down. Others waited till June, and on the night of June 7th a frost came, doing some damage in low land. On the whole, corn is looking well. Potatoes are looking well; frost cut them down in May, but they have a good start now; bugs are showing their ambition to be equal to any emergency. Apples blossomed moderately well; but about the time the blossoms were falling, frost and cold winds came on in low lands. There will be no fruit on the hills; that is, there may be a moderate supply, but nothing to what we had last year. Rye is looking well. Oats are from fair to very good. Wheat is but little raised here; more was put in last fall than usual; it is looking encouraging. Grass is looking remarkably well. The weather is cool—just the weather for grass. Butter is selling for from 15 to 20c. per pound; eggs, 12c. per dozen. C. C.

NORTH GUILFORD, New Haven Co., Conn.—We had quite dry weather in May, but lately we have had abundant rains. Potatoes and corn, especially the former, were damaged to some extent by late frosts, though they are growing finely now. There is not much wheat raised in this section, but more than usual has been planted this year and it looks well. Grass is our principal crop. A small crop of apples. Pears abundant. Many old meadows are light, but grass on newly-seeded land will be heavy; on the whole, there will be a fair average crop—more daisies than usual, which are now in full bloom. C. A. F.

ROME, Oneida Co., N. Y.—We have our crops all in the ground, except perhaps turnips, and some other late summer crops. We have had the finest time for getting in crops the past spring; not a rainy day to put back spring's work, as is frequently the case; but, as an offset, we have been suffering from a May drought, such as probably has never visited this section before. The ground not having been frozen much the past winter and the great body of snow on the ground having melted off last spring, the soil was thoroughly saturated with water at that time, and no plowing was done till nearly the last of April, since which time there has been no rain to hinder the labors of the farm, and during the month of May only three light showers, one on the fourth, then pleasant weather till the 16th, when we had a misty day, but not enough rain fell to stop the field work of man or beast, but it kept the ground and air moist for one day. Then we had cool weather with a number of hard frosts the following week, which seemed very discouraging to the farmer. On the 27th, we had a fine gentle rain which helped the newly-planted corn, and was particularly beneficial to grain, spring sown, and winter wheat, of which we have only small pieces in this section. These are looking very well, though they have not made as much growth as they would have done, had there been the usual rainfall during the month of May. Since June has come we have had gentle showers that have revived the fields considerably, and, should we have timely rains now, our crops may still be up to the average, although the crop of hay must be light on most grounds. Some rich moist lands will produce well, and the rowen crop, if we have a moist summer, may be abundant. That, however, will depend upon the later rains. Should these be abundant, there will, no doubt, be a fine crop of rowen this fall, and if the first crop prove short, considerable of the second will be cut for hay. Our farmers are largely engaged in the dairy industry, and a short hay crop is a sore loss to them, as the grass crop is their main dependance for both summer and winter feed for their cows. Our method of fitting ground for corn, is to draw and spread all the manure we can make during winter and spring, on sward ground, spreading it as we draw it, and as soon as spring opens, use either a brush or harrow to go over the ground and break the lumps and smooth the manure as fine as possible before the ground is plowed, which we usually defer till near the time of planting. This year the ground so manured kept moist much longer than when no manure was spread, so that it was more easily plowed in consequence of the moisture retained. Usually the month of May is quite wet so that our grounds are abundantly wet for plowing for corn, but this year it was quite the reverse, and some pieces were delayed for rain to come and soften the ground, so the corn was not planted till the first of June. Some pieces are so dry that the writer was informed, on this 12th of June, that the corn that had been planted some time had not sprouted yet, but that it was thought to be planted too deep. The corn on my farm, planted after the 20th of May, we are now working out the first time. We are also working and shall finish to-day, a field of sweet corn planted thick for feeding purposes. The yellow field corn we shall begin upon to-morrow. Blunt's White Prolific is up and looking finely. I don't expect to get rich from that this year, but intend to give it good culture and report result in the fall. My trial patch of potatoes is looking finely; we have them well worked out once, and as they were planted on a new piece—that is, where no potatoes have been planted during the past few years—they are not infested with the beetle so far to their detriment. The Beauty of Hebron, and Bliss's Triumph are taking the lead in growth so far. We shall watch the race with some interest, and intend they shall have a fair field, and no favor to either; and if they prove a success, I shall report in the fall. I intend to keep off the bugs, and also destroy all the weeds among my potato crop this year, if possible. Last year our potato fields were badly overrun with weeds in this vicinity, and the crop was small. We hope for more potatoes this year and fewer weeds. We have some winter wheat in this town, that is looking much better than the average of a few years ago. We have for the past two years had extra crops of winter wheat. This year the best piece is one where wheat was grown last year, sown on clover sod after harvest. Last year the ground was carefully plowed and the same piece sown to wheat again. A little barnyard manure was spread upon the ground both years and the crop was an extra good one last year, and promises to be equally good this year, with probably a shorter straw. A field on an adjoining farm, sown after oats in the fall of 1877, produced also an extra crop in 1878. It was sown again last fall to wheat, but does not look as well as the first piece mentioned, at this writing, probably from lack of manure, although a barrel of salt was sown to the acre on the last-mentioned piece before sowing the wheat last fall. J. T.

SHARON CENTER, Schoharie Co., N. Y.,—The first day of the month gave us a fine shower, the first to wet a man's shirt, since the snow left. Of the 16 days of this month it has rained more or less on twelve. Yesterday, last night and this morning we had a heavy rain, the first time we have seen water standing in water holes. Grass is too far gone to give us a full crop of hay. Spring grains are looking very well—drilled grain being far the best. Winter wheat is good, but little is raised here. Most farmers, however, sow a little for bread. This was once a wheat section, and with proper care I think we can raise it again. L. L.

CHENANGO FORKS, Broome Co., N. Y.—The whole of May and the first days of June were very dry, with occasional frosts, but since about the 10th we have had frequent showers and good growing weather. H. K.

COLUMBIA, Lancaster, Co., Pa.,—In this part of Lancaster Co., so far as my observations extend, the grain crops are quite promising. Wheat generally is making a healthy growth, and is now promising a full average yield. In some sections the severe hail storm of the 4th inst, nearly ruined many fields, and smashed lots of glass on greenhouses and dwellings. Rye so far looks quite promising. Oats are rather short, having been sown late. Grass too is rather short, but thick on the ground, and will turn out an average crop of hay. Owing to the drought through the month of May, vegetation is rather backwards, but now the late soaking rains are giving it a start. Corn, too, comes up well, and potatoes, so far, are very healthy. Farmers now generally apply Paris-green as soon as the bugs make their appearance, though yet the pests are not as plentiful as in former years. In general, the prospect for good crops are cheering, and farmers have no cause for "grumbling," unless it is at low prices of produce and high taxes. Sweet cherries are very few; sour or Morello cherries, a fair medium crop. Strawberries were a very short crop from the drought in May. Cherries, Peaches, Pears and Plums bloomed profusely, but the fruit is dropping off very much, and will not require thinning by hand-picking. Peaches and Pears may ripen a medium crop. Although Plums are very full of fruit now, by the time it ought to ripen, the "little Turk" will have caused the last plum to drop, as usual! Of apples I might say there are none. The trees bloomed very sparsely. Last year they were white with bloom, still we had no apples, and, of course, we expect none this year. Grapes were never more promising, at this season of the year. T. B. G.

MENNO, Mifflin Co., Pa.—We have fine growing weather after a long dry spell. Wheat is doing well. It is not likely to be a full crop, however. In our township it is pretty good, but in some parts of our valley it is not half a crop, and the wet weather may yet damage it somewhat while it is in bloom. Oats, I think, never looked better, and corn is doing very well. The acreage is about as usual; as farms here are generally small, the proportion to each crop doesn't vary much. Potatoes are more than an average, and are doing well. Fruit is not over an average. Grass is short, but well set on ground. Wheat sells for $1.05; corn, 50c.; oats, 30c.; butter and eggs, 8c. Horses and cattle are doing well. Fat cattle sell from $4 to to $5.50 per 100 pounds live-weight. Cows are very low. D. A. H.

MILL VILLAGE, Erie Co., Pa.—The weather during the past few days has been very cool, and two or three frosts on the creek bottoms have done some damage. Crops are looking well, except wheat which was badly winter-killed. Potatoes are scarce and readily fetch 75 to 80c. per bushel. Wheat is worth $1 10; oats, 30c.; butter, 10 to 12½c.; eggs, 10c. per dozen. A. C R.

SUMNEYTOWN, Montgomery Co., Pa.—In this section all vegetation suffered this spring by an unusual drought, but recent rains give us a promise of a fine crop of grass. Wheat is not quite as good as last year. Corn, oats and potatoes are growing finely; and, the season now being favorable to their maturing, we can expect more than an ordinary yield. Apples, pears and other small fruit indicate a full crop. E. M. B.

REEDSVILLE, Marshall Co., Kan.—Fall wheat will be only half a crop, owing to the dry spring and high winds. The roots of fall grain were left exposed to the latter. Spring wheat, oats, corn, millet, etc., all look well and promise an abundant harvest. Fruit, also, is doing well. J. G. C.

BLOOMVILLE Seneca Co., Ohio.—Wheat is good. Corn is poor, the dry weather injured a great deal of the seed and a great many had to replant. The prospect for potatoes is good. There are some few Colorado beetles to contend with. Apples and peaches will be light crops. The drought has injured the hay crop somewhat. We shall have a good crop of grapes. G. M. M.

VALLEY MILLS, Marion Co., Ind.—A very large area of wheat promises an abundant harvest. There is a vast acreage under corn. It is mostly small. Much replanting has been done. As July and Aug. are the months to bring out corn, no reliable prediction of the crop can now be made. Early potatoes have been flourishing, but are now receiving a sad check from the beetles. Many acres of late ones are just planted. There may be half a crop of apples, and only a few pears. W. B. F.

ANDERSON, Madison Co., Ind.—The spring was very cool and backward and very dry until about the 20th of May; since then we have had plenty of rain. Wheat never looked better, and there is a large acreage sown. Oats are light in quantity and quality. A large crop of flax has been sown, and the prospect for an average yield is good. Potatoes are looking well and about an average crop has been planted. G. W. A.

BAILEYVILLE, Ogle Co., Ill.,—There was very little rain here from April 10, to May 25, and vegetation suffered considerably from the drought, but there came a copious rain on the 25th of May, and frequent heavy showers since then, so the crops have revived greatly and are now in good condition. Winter wheat has headed out well and is very promising; spring wheat, oats and barley look fair, but some fields are weedy and the grain stands too thin. Corn will be a large crop here; it has a better appearance than at this time last year. Potatoes that were planted during the hot dry spell in May, failed to come up well, and some have been replanted. The Colorado beetles are quite numerous this spring, but vigilant farmers can out-general them by picking off the first ones that appear, and destroying the rest with Paris-green, when they become too troublesome for hand-picking. Fruit is a variable—we have a good many cherries, plums, etc., but apples are scarce. Had early cherries ripe on the 10th inst., but the birds have taken the most of them. Grain advanced some in price here of late, and farmers who had any to sell, have sold the most of what they had on hand. Prices are: wheat 85@90c; corn, 28@30c; oats, 28c; butter, 8@9c. for good dairy make; eggs 7c. fish, from the Mississippi River, 6c, per lb., dressed. W. B. D.

JACKSONVILLE, Morgan Co., Ill.—Wheat is generally good and of very good quality. The harvest is in progress. Corn is very uneven, owing to the very dry time we have had since the middle of April. Very little rain has fallen in this part of the county since that time; other portions of the county and State had rain in abundance. Potatoes are scarce and small. Fruits of all kinds are generally scarce. I think severe frost late in the spring is the cause of failure in this part of the State. Blunt's corn is looking first-rate; stands waist-high, and bids fair to give a good yield. M. A. H.

ROGER'S PARK, Cook Co., Ill.,—The spring has been cold, yet corn looks well; grass, spring wheat and oats have suffered for want of rain in this state and Southern Wisconsin. Farther west, as in Minnesota, Western Iowa, and Dakota, the grass is good and also all grain crops. W. H. G.

FLINT, Genessee Co., Mich.—The weather thus far has been quite cool and dry. Corn is rather backward. Wheat will be a fair crop. Hay is a light crop. Potatoes look well—plenty of "bugs." Apples will be scarce in this part of the country, the trees having blossomed very light. Cherries and plums promise good crops. Early cherries are ripening. C. B.

WOODLAND, Barry Co., Mich.—Wheat in this particular locality is thin, owing to a failure to come up well last fall; all there is of it is now heading finely. The State, I believe, expects a good crop. Corn and oats never looked better, despite the cold spring. Potatoes promise well, and fruits, particularly small fruits, are abundant. E. D.

MONDOVI, Buffalo Co., Wis.—The wheat prospects in this township are good. It came up poorly in the spring on account of dry weather, but about four weeks ago the weather changed to wet, and the wheat stooled out nicely and bids fair to be a big crop. Oats also look splendid. Corn looks poorly, yellow and small, on account of wet and cold. Potatoes bid fair to be a big crop. Fruit is good. Hay is the heaviest crop that we have had for years. R. T.

MINNEAPOLIS, Hennepin Co., Minn.—The weather has been rather cool so far in the summer. It was very dry early in the spring, but we have had plenty of rain for the last five weeks. Wheat is doing splendidly; there is every prospect for a big crop if it does not run to straw so much as to lodge. Corn is of a good color, but backward for want of hot weather. Potatoes are looking well; there are plenty of old bugs to stock each hill with eggs, but we don't fear them much as long as we can get Paris-green and water to sprinkle them with. Strawberries will be a very heavy crop—just beginning to come to market. Raspberries, currants, etc., all bid fair to be heavy crops. This is not an apple State. We had a light frost on the 15th. C. C. C.

FARMINGTON, Dakota Co., Minn.—Crops of all kinds are looking finely, and bid fair to give large yields. There is no particular section that looks better than another, but all look well. Grass is heavy and will yield a much larger crop than we have had for years. Fruit is a fair crop; children also. R. C. I.

TROY, Davis Co., Iowa.—This section of the country has been dry through the early part of spring but for the last two weeks, it has been raining every day. Fall wheat is the principal sorts raised here; it is doing very well except late sowing. Oats bid fair for a good crop. Potatoes are largely planted and are looking well. Owing to the dry weather corn had to be largely replanted. It is now too wet to plow, and some of it is getting weedy. Fruit will be scarce. Wheat sells for 55c. to 90c; oats, 48c; corn, 25 to 26c; potatoes 30c; weather, cool to-day J. G.

UNADILLA, Otoe Co., Neb.—I came here about six years ago from West Hoboken, N. J. I liked the country so well, that I bought 80 acres of land and commenced farming. I was here during the grasshopper siege, and had to work hard to make both ends meet; but I think I did better than staying around New York and working three days a week. I am by trade a carpenter. We have had a very dry spring, and small grain is very short and thin, but the corn crop looks fine. Fruit of all kinds will be scarce. We have just had a good rain, and it looks as if we should have more. Corn, hogs, cattle, and wheat bring fair prices—wheat, 75c.; corn, 20c.; hogs, $2.70@$2.80 per 100 pounds; cattle, $4@$4.15 per ditto. Barley and rye are grown here for feed only, as this is a stock section. We raise some fine hogs and cattle. H. J. P.

KEARNEY, Buffalo Co., Neb.—Crops in this section of the country are looking splendid; raising winter wheat here is an experiment this year, but is likely to prove a success, as it is already headed out and looking fine. Spring grain and corn are looking better than on any previous year. Fruit growing is in its infancy here yet, but what little there is, shows good prospects of a fair crop. Plums and grapes comprise our wild fruits, and the present prospects are that there will be an abundance of both, though of both, there has been none of any consequence for the last three years. The prices of country produce are about as follows: wheat, 72c.; corn, 46c.; oats, 40c.; potatoes, 50c.; butter, 12c¾.; eggs, 10c., flour, $2@2 40; hams, 10c.; shoulders, 6¾c.; bacon, 7¾c.; green peas, $1 50 per bush.; radishes, 5c. H. A. W.

SCHUYLER, Colfax Co., Neb.—Crops in this locality are uniformly good. There has been sufficient rain to keep things in good growing condition. In some few localities the wheat has been destroyed, but such instances are merely local. Corn is now from 8 to 12 inches high, and is growing finely. Wheat will be of an unusually good quality. Potatoes here were never known to fail. Of fruit there is very little in this portion of the State. The hay crop will be very large. E. A. C.

PALMYRA, Otoe Co., Neb.,—Wheat will be about an average crop, if nothing happens to it. Corn looks well for the time of year. Of oats very little has been sowed—a fair prospect for what there is. There will be no fruit of any account except strawberries. We are having plenty of rain and a fine growing time. D. C.

COLUMBUS, Platte Co., Neb.—Crops are good. Wheat will be short in straw, on account of dry weather in early spring, but the heads are well formed and filled. Corn, potatoes, fruit, etc., were never better. Everything is very prosperous. J. M. C.

FORT COLLINS, Larimer Co., Colo.—The climate here is very peculiar. The soil is a rich, sandy loam almost everywhere. It consists of alluvial deposits, free of shells and mineral matter. It is level, other than sandstone ledges. The climate, winds, cool nights, an absence of moisture, etc., together with the elements in the soil, all have a tendency to make all vegetation dwarfed. All fruit trees, forest trees, shrubs, flowers and grasses are short. No forest tree is higher than 20 or 30 feet. Garden peas never need sticks, nor do grapes. Beans trail along on the ground, and everything seems to be as prolific as in the East. Cabbage lies flat and spreads out in heads of 40 pounds without ever being troubled by the tortoise bug or green worm. Pumpkins, squashes and all vines flourish without fear of bug or black ant. The wheat crop is very promising and the early varieties are just heading. Immigration into this State is immense. Every State east of the Mississippi River is represented daily. "Everybody" is coming. Some stay, enter land and settle. Others buy town property and set up in some business. The western-bound trains are always full of people destined for Leadville or Oregon. Immigrant trains of wagons are continually passing, each followed by a dog. There seems to be no cry of "hard times" here. Everybody has some money. Wages are good, $1.50 per day of eight to ten hours being the minimum price paid the poorest day-laborers. Wheat does remarkably well in this soil; no less than 30 bushels per acre is the average. Corn does not flourish on account of the cool nights, but since the country has been cut up by ditches, trees planted and land cultivated, we have more rain, warmer nights and more moisture in the atmosphere. All small fruits do better than in the East. Business of all kinds is brisk. Good workmen, mechanics and farm laborers are in demand at good wages. We have, close by us, sheep ranches, cattle, chicken and butter ditto, which pay handsome profits. Sheep pay, clear of all expenses, over 30 per cent.; cattle, do better, and chickens sell for $6 to $6.50 per dozen. Among them there is known no disease. They are very easily raised, and do not cost as much as in the East. Herds of 1,500 to 5,000 sheep are seen all over the foot-hills and plains at this season. Cattle line and cover the banks of every stream on the plains. Sheep are herded every night; cattle, never. Not a sheep has been killed by dogs in this county. Cattle, sheep and horses die sometimes, and their carcasses lie untouched by bird or beast. They waste away by a dry decomposition and seldom emit the least offensive odor. A. E, B.

SALT LAKE CITY, Salt Lake Co., Utah.—The prospect for wheat is not as favorable as last year, owing to lack of rain and scarcity of water from

mountains for irrigating purposes. Dry farming; that is, farming without irrigation, heretofore proven a success in many places, this year is considered a failure. From this cause wheat has advanced 40c. Corn is somewhat backward from the same cause. Potatoes are promising and indications are that the fruit crop will be better than last year, excepting apricots and peaches in some localities. The buds were killed by an early frost. R. T. M.

SILVER REEF, Washington Co., Utah.—So little snow fell throughout these mountain regions last winter that streams are unusually dry, and in some places dried up. Until within four days we had no rain this season and the general prospects have not indicated half a crop. They have had a good rain in the northern part of this Territory recently and this has improved their prospects. Here in the South there has been very little rain and prospects are poor. J. E. J.

ETNA MILLS, Siskiyou Co., Cal.—The prospects for wheat, oats, barley and potatoes are very good. The fruit crop is short, on account of late frosts. Corn is cultivated only as a garden crop; it looks well. Wheat is 1½c. per lb.; oats, 1½c.; potatoes, 2½c. per lb. J. E.

ELLSWORTH, Ellsworth Co., Kan.—The weather here for the past six weeks, has been warm and dry—no rain. Spring wheat and oats are badly damaged. There is much that will not be cut. Winter wheat is about one-third of a crop—much late sown wheat is not worth cutting. Corn is good. With a little rain it will be an average crop. Potatoes are badly damaged by drought. Small fruits will be average crops. H. B. W.

WICHITA, Sedgwick Co., Kas.—The wheat harvest is half through; weather favorable. The crop is variously estimated at from a quarter to a half yield, on account of dry weather from September to April. Late wheat, what there is left, is the best. Corn is three to four feet high; an immense area has been planted, and the season is favorable so far. Wheat now is 90c., corn and oats 30c., on account of home demand by immigrants, who are pouring rapidly into this section this season. J. C. D.

EMPORIA, Lyon Co., Kan.,—Corn is looking well, and prospects are fine. Wheat is only about half a crop. Peaches, a failure this year. Cherries, half a crop. Small fruits not very good. W. R. G.

SWOOPE'S DEPOT, Augusta Co., Va.—Wheat has had some very severe trials in this section; first, from the freezing weather in late winter and early spring, when the ground was bare; then, from the long-continued drought later on. This made farmers very despondent until the last of May, when we had some very refreshing showers, which made a wonderful change in the prospects; and now, within a week's time of harvest, wheat is looking quite well—I never saw it better headed—so we think, that, after all, we shall have more than an average crop. Corn, thus far, promises well, though it is now needing rain. Oats will be short. About half the fruit was killed by late spring frosts, but we will still have an abundance. Strawberries are just done; of them we had a quantity of very fine ones. We are now harvesting our early grass, which makes a fair crop. I noticed a statement, about three weeks ago, in the RURAL that the *pea bug* destroyed the germ of the pea. I have been planting peas for the last fifteen years, and have never planted any other kind than those which had been eaten by the bug, and they always germinate just as well and grow as vigorously as if they had not been eaten by the pest; indeed, it is so common to see the bug-eaten pea, that we never think anything of it. S. C. B.

DUNNSVILLE, Essex Co., Va.—We are now harvesting wheat, but the crop will be short having been killed by a hard winter. We have had a very dry spring and pastures are not good. Corn looks well; there is generally a good stand. Gardens are poor. Fruit is quite abundant, and there is quite a business at this place now canning cherries. The business outlook is not good here; corn and wheat were both short crops last year, and prices have been low. Our section has greatly improved since the war up to last year. This section of Virginia greatly needs good mechanics who would do well among our people. Young farmers would also do well, as land is very cheap and raising cattle and sheep, very profitable. Corn is selling for 50c.; wheat, $1; Irish potatoes, $1; wool, 28c.; sheep, $2 50 to $4. R. S.

HERNDON, Fairfax Co., Va.—We have just commenced our wheat harvest. Wheat is good. Corn is looking very well—a little backward, owing to the cool weather. Potatoes bid fair for an average crop. The fruit crop of all kinds is very promising. W. H. V. D.

WELLSBURG, Brooke Co., W. Va.—The prospects for wheat are below an average. Corn is backward, but a good stand and looks healthy; almost all had to be replanted on account of dry weather. The potato prospect is very good. There will be good crops of apples, berries and grapes. Peaches are a failure. J.

GADSDEN, Richland Co., S. C.—Richland county, of which the city of Columbia is the county seat, (and also the capital of the Palmetto State) belongs to what is termed Middle South Carolina, the term being used to distinguish it from what is known as the low country or tide-water region, and the mountain or Piedmont section of the State. The soil is adapted principally to the cultivation of cotton and corn, though oats, potatoes, etc., are also important products. Some wheat is also raised, though this is done principally in the red-clay country above us. The oat crop, just harvested, has resulted in a more than average yield and farmers are much gratified therein, and I think it will stimulate them in future to pay more attention to that important grain than has heretofore been given it. The present outlook of cotton is a far more cheerful one than it was three weeks ago. A continual cold spring caused very bad stands, and a back-set was given to the sensitive plant, that for a long while made our farmers look very blue. Now, however, the plant has been revived by a spell of warm weather and seasonable rains, and is in an average healthy condition, and this fact, coupled with the advance in price of the staple and comparatively low price of provisions, has greatly encouraged our planters. Corn has been planted somewhat in excess of last year. A great deal of it had to be replanted in consequence of cold, damp weather, and is consequently somewhat backward. The yield, however, bids fair to be a good one, and some farmers have already "laid it by." In this connection I would state that "Blunt's Prolific" is looking well, and I have some stalks in my garden now with four ears upon them. The fruit crop in this section is a complete failure—a killing frost in the early part of April did the damage. It was thought at first that a third or probably a half of a crop would be made, but the result proves that there is not a fifth. Irish potatoes were cut down a great deal by the April freeze, and I presume there has been about three-fourths of a crop made. The "Beauty of Hebron" sent by RURAL, on account of the unfavorable season, has not turned out as well as I had every reason to anticipate at the outset. I think, however, it will do well here, and will try again next season. A. S. D.

ATLANTA, Fulton Co., Ga.—The corn crops in this section of the country promise to make a full average, especially since we are having rains again. The early corn is now in "silk and tassels." Wheat will yield ten per cent. over a full crop; it is now nearly all harvested. Irish potatoes will make seventy-five per cent. of a full crop. C. D.

TALLAHASSEE, Leon Co., Florida.—The continued good weather and seasonable rains have had the effect of giving our crops a "good finish off." The oat crop is harvested and a fine one it is. Corn is made and, I think, is an average crop. Cotton is doing well, and I think picking will commence probably one week later this season than last, I say about August 20th. A SUBSCRIBER.

ELKMONT, Limestone Co., Ala.—We are having fine growing weather, and it has been a good season so far for the farmer. Wheat in this section is nearly all cut and is a good average crop. Farmers are paying more attention to wheat, oats, rye and clover, and not so much to cotton as heretofore. Corn and cotton are looking well, and some farmers are through working the former. Apples and peaches are a failure this year; they came out in full bloom, but some hard frosts, about the 24th of March, took all the peaches and nearly all the apples. New wheat is worth 75 cts a bushel. W. N.

SOUTH LOWELL, Walker Co., Ala.—The wheat crop is good for this country, and mostly secured in good order. Oats and potatoes will be light crops, owing to the dry weather for the past month. Corn promises to be a fair crop. Cotton is small for the time of year, but growing well now. Peaches were nearly all killed by frost the first of April. Apples will be about half a crop. Quinces, none. Small fruit, a fair crop. J. F.

HUTTO, Williamson Co., Texas.—In this section of our State and county the matured crops and the prospects for late potatoes, corn and fruits are poor. The long-continued drought and a very hard hail storm are the main causes. Wheat, about one-third of a crop, and oats one-fourth, many fields not being harvested. Potatoes are almost an entire failure. If we have rains within 10 days, corn will yield half a crop. Fruits about one-fourth of an average. E. E. S.

WHITNEY, Ontario Co., Canada.—I have made inquiries about crop prospects here, and the report I get is good; fall and spring wheats look well. The prospects now for all crops are very good, but it is three or four weeks too early to make a general estimate. The fruit crop will be an average. Corn and potatoes I cannot say anything about so soon—they have come up very well. J. S. M. W.

There are many perfumes which, when applied to the handkerchief, have a very agreeable odor for a few moments and then die away, leaving only a sickly disagreeable smell. Not so with MURRAY & LANMAN'S FLORIDA WATER; the longer it is exposed the more delicate and delightful becomes its rich aroma.

Dyspepsia, Biliousness, Nervousness and miserableness all cured with Hop Bitters.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 21st, 1879.

BEANS AND PEAS.—Local consumptive wants are small at this date. Very few high priced mediums are selling; what demand exists comes from buyers who can use fair sound stock, and of this grade there is a fairly free offering. There is not animation enough to vary prices. Supplies of marrows for export have to be strictly sound, as they go from one hot locality to another, the West Indies being the main outlet. White and Red Kidneys quoted chiefly in a holding sense. Peas unchanged; green, ₱ bu. $1.80@1.85; B. E. peas, per 2 bush. bag, $2.50; Canadian, in bulk and bond, 75c., as a small selling price. Beans, mediums, prime, $1.30@1.32½; fair to good, $1.20@1.25; marrows, prime, $1.35@1.37½; fair to good, $1.20@1.25; pea, $1.20@1.35; white kidney, $1.30@1.50; do., red, $2.80@3; turtle soup, $2.15@2.20.

Receipts of beans for week, 5,300 bush.; exports, 555 pkgs.

BEESWAX.—Demand is slack and prices a little unsettled; quoted at 24c.@24½c. for Western and Southern.

BROOM CORN.—Offerings are moderate and firm at prices quoted; quoted as follows:

Brush and short broom, choice, ₱ lb, 5½@6½c.; do., common to good, 4½@5½c.; hurl, good to choice, 3½@4½c.; do., common to fair, 3@3½c.; red and crooked, 2@3c.

BUTTER.—Were it not for the unwieldy supplies, the market might be noted as enjoying a good movement, but regardless of the low prices a good portion of the receipts remain on hand. In respect to the surplus, dealers latterly have been favored by cool weather, which has permitted them to safely cellar unsold parcels of June of good body and quality. With quotations down where they are, consumption should largely increase, though no one expects it to absorb the full totals that have been pouring in all this month. Under-grade stock is hard to place when fine creamery, pails and half-tubs, can be had without laborious searching at the extreme quoted. There is a lull in the Eastern demand; both buyers and sellers are adverse to heavy transactions while strikes are threatened in several populous localities. Foreign exporters seem in no hurry to send out stock at the rate they might, prices considered. Sales for Europe have become the most sought for of anchor transactions in butter. They are attended with early settlements, and when the property is on board it is permanently out of home calculation. English buyers realize that they have become a power, and this season more than at any previous period, they have to be specially regarded. Recent ranges are repeated, but inside figures mainly represent transactions.

State pails and half tubs, choice, 13½@14c.; good to prime, 12@13c.; fair to good, 11@12c.; firkins, choice yellow, 15c.; fair to good, 13@14c.; Welsh tubs, choice, 13½c.; good to prime, 12@13c.; fair to good, 11@12c.; poor, 9@10c.; State creamery, best invoices, 16c.; good to prime, 15@15½c.; sweet cream, best, 15@15½c.; fair to good, 14@15c.; Western, best invoices, 16c.; good to prime, 15@15½c.; fair to good, 14@15c.; imitation creamery, 11@13c.; Western dairy, best invoices, 13@13½c.; good to prime, 11@12c.; fair to good, 10@11c.; poor to fair, 8@9c.; Western, factory, best invoices, 11c.; good to prime, 10@10½c.; fair to good, 9@10c.; poor to fair, 7@8c.; grease butter 4@4½c.

Receipts, 46,750 pkgs.

CHEESE.—The market has been in poor shape this week. Dull accounts from the other side dispirited exporters, and there was the additional disturbance of large receipts. A pressure to sell gave a fair business, but there is a good deal of stock to be carried over. The closing market on the choice factories is 6@6¼c., and an occasional parcel reaching 6¾c.

Quotations are for new factory: 6@6¼c. for best; 5@5½c. for good; 4@5c. for fair to good; 3@4c. for half skimmed, and 1@2½c. for skimmed; dairy at 5@6c. for good and fine; 3½@4½c. for fair to good, and 1@2½c. for skimmed; Western factory at 5¾@6c. for fine; 2¾@3½c. for half skimmed, and 1@2¼c. for skimmed.

Receipts for week, 82,700 boxes.

Liverpool cable, 37s.

COTTON.—The market has shown a good degree of activity, and left off firm at for June, 12.45@12.46c.; July, 12.45@12.46c.; August, 12.57@12.58c.; September, 12.40c., October, 11.57@11.58c.; November, 11.15@11.17c.; December, 11.07@11.09c.; January, 11.10@11.12c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted:

Strict good ordinary	11⅞	Middling	12 1-16

DRIED FRUITS.—In apples evaporated lots are having a very good inquiry and they rule at firm prices; low-grade stock is still dull. Unpeeled peaches are at firm figures. Peeled peaches are dull. Blackberries are somewhat stronger.

Apples—evaporated Alden's & William's 10 ¢@11c.; do. new process at 8½@9c. State plums, 10@11c. Blackberries quoted at 4¾@5c. Peaches—Peeled Georgia, 7@7½c. for poor; 8½@9c. for fair to good; 10c. for prime; choice North Carolina, at 12@13c.; good do., 9@10c.; unpeeled halves, 3@3½c. quarters, 2¾@3c. Pitted cherries, 21c. Apples—New, 2¾@2¾c. for Southern quarters in bags; 2¾@3¼c. for sliced; State, 3@3½c. for new sliced, and 3@3½c. for quarters; Western, 2¾@3¼c. for new quarters. Raspberries, 30c.

EGGS.—Receipts for week, 9,500 bbls.; do., last week, 10,100 do. There has been a very steady market, but at the close prices are a shade weaker. L. I. and other near points, 14¾@15c.; Western and Canadian, choice, 13@13½c.; poor Western, 11½c.

FRESH FRUITS.—Russet apples remain in quotable quantity mostly small stock; the range is $1.25@3. New Jersey strawberries have about run out. Connecticut and the Hudson River points will keep the market supplied until July. Prices have ruled quite sturdy since the glut of last week. Extra Up-river, quarts, 18c.; prime, 12@15c.; thirds, 4@5c.; N. J. remnants, 4@6c.; hulled, small baskets, $2.50@3 per crate. Cherries are a failure hereabouts; the market will depend largely upon State crates. Table sorts, 12@15c. per lb; common, 4@6c.; Southern Black caps, quotable next week. Peaches are not important yet. No stock to quote. Texas watermelons give the market an advanced look; they are worth $35@35 per doz. Gooseberries, per bush., $1.50. Peanuts have a steady market, prices well supported. Va. hand-picked, $1.35@1.40; fancy, 1.22@1.25; extra prime, $1.17@1.20; good to prime, $1.15@1.30; shelled, per lb., 5@5½c.; Pecans, 8@8c.

FLOUR.—Prices have tended a trifle easier on account of a decline in wheat; trade has been very fair.

The quotations are: $3.35@3.85 for inferior to very choice superfine State; $3.80@4.10 for poor to good extra do., odd lots and lines; $4.10@4.35 for good to choice do.; $3.35@3.90 for inferior to very choice superfine Indiana, Iowa, Michigan, &c.; $3.75@4.10 for inferior to good shipping extra do., and $4.10@4.35 for good to choice extra do.; common to about choice white wheat extras, $4.50@5.65; choice to very fancy do. at $5.75@6.75; red and amber winter wheat, inferior to very choice trade and family, at $4.45@5.00; round hoop Ohio at $4.10@4.40, and trade and family brands of do. at $4.60@6.25, the latter rate for fancy; St. Louis, $4.50@5.65 for inferior to good extra; $5.60@6.50 for good to very choice (with fancy brands up to $6.75); Minnesota clear, inferior to fancy, at $4.50@5.00; Minnesota "straight," very inferior to strictly choice, $4.60@6.00 (a few fancy as high as $6@6.25), and patent poor to strictly fancy at $5.25@6.75, few brands going above $7.00; unsound stock at from $2.25@5.00; city mill extra at $4.85@5.15, about fair to choice, for West Indies (strictly fancy in new packages held higher); do. for England, $3.70@4; do. trade and family extras, $5.25@6.25; do. for South America, $5.50@5.65 for standard brands (winter wheat product); No. 3 at $2.35@3.25 for poor to strictly fancy.

GRAIN.—Wheat on the favorable crop prospects tended lower, and there has been a pressure to sell; at the close there is rather more strength.

Latest sales are of ungraded white at $1 12@1 14; No. 1 white at $1 14½; white State at $1 15¾; extra white at $1 15@1 16; No. 2 red at $1 16¾@1 17½; ungraded red at $1 05@1 17; ungraded amber at $1 15; mixed winter at $1 15; mixed spring and winter at $1 05; No. 2 spring at $1 04@1 05; No. 3 spring at 90½@92c.; do. steamer grade at 87½c.; No. 4 spring at 85c.; ungraded spring at 85c.@$1 04; No. 1 white, June, at $1 14½; no. July, at $1 12½@1 13; do. August, at $1 10@1 10¾; No. 2 red, June, at $1 17¼@1 17½; do., July, at $1 12@1 13; do., August, at $1 14; do., September, at $1 07½@1 08; New York No. 2 spring, July, at $1 05; No. 2 Northwest spring, July, at $1 04. Rye at 65@66c. for State and Canada, and 61@61½c. for Western. Corn has been active and closed at strong prices; sales of New York No. 2 at 43@43¾c.; New York No. 1 at 43¾@44c.; New York steamer mixed at 42¾@43c.; New York No. 3 at 41c. for car lots; ungraded Western mixed at 40@43¾c.; New York No. 1 white at 51@52c.; New York No. 2 white at 49@49½c.; New York steamer white at 45½c.; low mixed at 46¾@47c.; New York yellow at 45c; New York steamer yellow at 43½c.; yellow Western at 45c.; New York No. 2, June, at 43¼@43½c.; do., July, at 43¾c.; do, August, 45¾@45¾c.; do., September, at 46¾c.; steamer mixed, June, at 43c., do., July, at 42½c.; do., August, at 41½c. Oats have been active, but have not shown much further change in price; latest sales of New York No. 1 at 38½c.; New York No. 1 white at 41¾@42c.; New York No. 3 at 36¾c.; New York No. 3 white at 37¾c.; New York No. 2 at 38@38½c.; New York No. 2 white at 38@38¾c.; white Western at 38¾@42c.; mixed do., at 36@38½c.; white State, 40@41¾c.; No. 2 Chicago, afloat, at 38¾@39c.

HAY AND STRAW.—There is a very fair business in hay, and strong prices made for both shipping and retail quantities.

Sales at 40@45c. for shipping, and 70@80c. for prime retail qualities. Straw at 45@55c. for long rye; 45c. for short rye, and oat at 30@40c.

Exports for week, 675 bales.

HOPS.—Emmet Wells in his circular says: "The market this week has been fairly active, the demand coming chiefly from brewers. Prices are without any alteration, though choice hops show a good deal of firmness. The reports from the hop districts indicate a very backward condition of the vine; the weather keeps unseasonably cool, thereby checking its growth; this, added to the indifference shown by growers in the care and cultivation of their grounds, render early prospects unfavorable to a large yield. The hop news gathered thus far from our exchanges points to a considerably smaller crop than last year. Should hops open high next September (and early indications tend very much that way) growers who are now neglecting their yards will be sorry for it."

Quotations are for New York's new crop, choice, 9@12; New York's, new crop, medium, 7@8; New York's, new crop, low to fair, 5@6; Eastern, 6@9; Western, 3@9; Yearlings, 2@4; Olds, all growths, 1@2. Pacific coast, nominal, 8@10.

POULTRY AND GAME.—There is a better feeling in cooped fowls. Chickens are running small, and such are hard to sell. Market lower for best.

Chickens, large, per lb., 18@20c.; small, 16@17c.; fowls, N. J., 13½@13c.; Western, 11½@12c.; Southern, 10½@11c.; roosters, old, 5@6c.; turkeys, 8@10c.; ducks, N. J., N. Y. and Pa., ₱ pair, 65@70c.; Western, 35@45c.; Southern, 30@35c. Geese, Jersey, $1.25@1.50. N. Y. and Pa., $1.25@1.50; Western, 87c.@$1.12; Southern, 75@87c.; pigeons, 40@45c.

Dressed poultry is in full supply with the offerings of city killers; heavy chickens are wanted.

Turkeys, Phila. dry-picked, 16@18c.; State and Western, prime, small, 12@14c.; Jersey, small 12@14c.; fair to good large, 10@11c.; chickens, Phila., dry-picked, broilers, 30@35c.; fowls, N. J., prime, 3c.; State and Western, prime, 13c.; fair to good, 10@11c.; Pa., dry-picked, 12@14c.; ducks, Jersey, 14@15c.; State and Western, 12@14c.

Game has almost a nominal position only. Quotations are for strictly sound sorts.

English snipe per doz., $2.25@2.50; Dowitch, $1.37@1.50; small and sand, 40@50c.; plover, $1.75@2; pigeons, wild, netted, $1.25; shot, 75c.@$1; squabs, tame, $1.75@2; soft crabs, Southren, 30@50c.; frogs legs, per lb., 6@18c.

PROVISIONS—Have tended a little higher, with a fair trade in progress. Mess pork quoted for June at $10.15 bid, and offered at $10.25; July at $10.20 bid and $10.27 asked, and August at $10.25 bid and $10.35 asked; September at $10.35@10.40. Bacon at $5.10¼ for long clear and $5.45 for short clear. Lard—Western steam, at $6.42½ for spot and June; $6.45@6.47½ for July, and $6.52½ for August. Stearine at 7¼@7½c. Tallow at 5 15-16@6c. for prime. Beef hams at $17.25@17.50. Beef—Extra India mess, $17.50@20, as to quality; packet, $10@11.50; plain mess, $9.75@10.50; extra mess at $10.50@11.50.

SEED-GRASS—Is quiet; Clover quoted at 6½@7c., as to quality.

TOBACCO.—There is no improvement in export demand, but a fair local trade in progress, and prices essentially as last week.

VEGETABLES.—None but city owners now have any interest in the remnant of old potatoes and we drop them from the list. New are plenty, especially from Va. A late Norfolk steamer brought 14,000 bbls. Garden truck has a cheaper outlook; demand fair. Potatoes, Bermuda, $4@5; do., Charleston, Rose, $4; do., do., Peerless, $3@3.50; do., do., Chili Reds, $4; do., Norfolk Rose, $4; do., Maryland Rose, $3@3.50; do., seconds and culls, $1.50. Green Peas, L. I., bags, 75c.; Beans, Norfolk flat per bbl, $1; do., do., round do., $1.50; Asparagus, Oyster Bay, $1.25@1.50; do., N. J., $1@1.25; Rhubarb, per 100, $1; Tomatoes, Bermuda, per box, 35c.; do., Florida, ₱ bu. cr., 12@2.50; Beets, Nor. 100 bunches, $2; do., nearby, $3; Cabbage, Norfolk, ₱ bbl., $1.25@1.50; L. I., ₱ doz., 75c.; Onions, Bermuda, ₱ crate, $1.75; do., Nor., per bbl., $4.50; Squash, Sav. and Ch. ₱ cr., 75c.@$1; Nor. hf. bbl. cr., $1@1.25; L. I., ₱ bskt., $1.50. Turnips, Jersey, per 100 bun., $2. Cucumbers, Norfolk, hf. bbl. cr., $3.50; do. do. hf. do., $2. Cauliflower, L. I. hot-house, ₱ doz., $1.50@$4; Nor., ₱ bbl., $3.

WOOL.—The Western fleeces have been bought up well, but there have been free sellers on the large receipts, and prices have not varied. In the reports from Ohio State there is less excitement and some easing off of prices, with sales taking place at 35@38c. Quotations are:

Ohio, Pennsylvania and Virginia—XXX and picklock, 43@45c.; XX, 40@42c.; X, 38@40c.; No. 1, 33@40c.; No. 2, 35@37c.; common, 33@36c.; combing, nominal.

New York, Michigan, Indiana and Wisconsin—XX 32@36c.; X, 30@35c.; No. 1, 26@30c.; No. 2, 33@35c.; common, 31@33c.; combing, nominal.

Iowa, Vermont and Illinois—X and XX, 31@35c.; No. 1, 33@37c.; No. 2, 30@32c.; combing, nominal.

Missouri, Kentucky and Tennessee—Washed fleece, 37@40c.; unwashed fleece, 30@35c.; unwashed combing, nominal.

LIVE STOCK MARKETS

NEW YORK, Saturday, June 21st.

BEEVES.—Receipts for the week, 11,598 head; do., last week, 10,634 do. There has been some fluctuation during the week. At the yards, when full supplies were present, prices would break a little compared with Wednesday last. Later sales, however, restored the tone, and full Wednesday's rates were steady at the close. Excepting some Texas stock sold early at 7¼@7½c., the range of the market was 8@10c. with bulk of sales at 8¾@9¾c. For export, 9¾@10c. was paid. The demand is large for the week, as it includes 1,800 head live and 3,600 quarters.

COWS AND CALVES.—There has been some carload business at $35@55 per head. There is, however, no feature to induce heavy supplies.

VEAL CALVES.—A good stiff market is ruling. State milk fed sell on equal to N. J. Prime quoted 6½@6¾c.; poor and skim-milk calves, 4@4½c.; buttermilk, 3@3½c.

SHEEP AND LAMBS.—Receipts for week, 33,739 head; do. last week, 25,831 do. The market for the week opened firm, but has eased up to some degree. Export grades of sheep in good demand. Sheep range 4@5¾c., the high rate for shipping quality. Southern and Western lambs, including Ky., Del. and Md., 5@7c.; N. J., 7@8c.

HOGS.—Receipts for week, 25,659 head; do. last week, 26,693 do. The holding price at the yards at the close was $3.90@4.20 ₱ 100 lbs., the latter for prime 200 lbs. corn.

City-dressed, 5@5¾c. for heavy to pigs.

NAG'S HEAD;
Or, a First and Last Sea Voyage.

DR. J. T. PAYNE.

TWENTY-FIVE years ago there lived at Stoneham, near Boston, a boy named William Lewis,—commonly called "Bill" Lewis. He was known as an intelligent lad, for one of sixteen years. He had mastered the studies of the common school; his father, who divided his talent between a small grocery store and a farm, set his face squarely against his son's going to a higher institution. "Bill," he said, "can take his choice between farm and shop; but he must follow one or the other."

The boy decided to try the shop. He had not served long behind the counter, when he was one day directed by his father to go to Boston and purchase a hogshead of molasses, and other articles to replenish the stock. Mr. Lewis was desirous of retiring from trade and giving over that business to his son, while he devoted himself to agriculture; he therefore thought that his son, should learn how to buy as well as how to sell. Bill set off with a sum of money in his pocket and driving a fine span of black horses; he was in pretty high glee at the thought of being so much of a business man.

Arriving at the city he drove to the great wholesale house of Day & Knight. Leaving his team before the door, he entered, made known his wants, and was conducted to the cellar, where he tasted of different grades of molasses, priced them, and made a careful selection. He then returned up stairs and with a good deal of talking filled out his list of purchases, closing what he considered a very good bargain.

It should be said that Bill's mother had never liked the idea of his following in the footsteps of his father; she had selected, one after another, at least half a dozen different vocations for her son; the latter, however, assured her that he should one day be a merchant prince, if allowed to succeed to the little grocery.

As he stood in the great Boston store, his pride was wonderfully gratified, and he thought he was just going to show his mother, what was his ability to transact business. Indeed, he had told her on leaving home that by the time he returned she would perceive that he was something more than a boy.

What grief awaited him! On going out to place his team for loading, he found to his dismay that it had been stolen.

Bill hurried through street after street, and spent the remainder of the day in a fruitless search. That night he lodged at a hotel, and in the morning continued his wanderings about town, seeking the black horses and the lost wagon everywhere. He made some inquiries of strangers whom he met, but for the most part was only laughed at. It looked as if they didn't take much stock in his story.

In the afternoon he met two men near the Boston and Maine Depot who took a deep interest in his case and offered to help him. They were sharpers, and before parting company with the country lad, they managed to fleece him of three hundred dollars.

It was this climax of misfortunes which made Bill hasten to the end of T Wharf, firmly resolved upon throwing himself into the water and getting beyond the sufferings of this evil life. His pride was too deeply wounded; he had not the courage to face his family.

As he approached he saw a schooner with sails set, apparently ready for sea. He jumped on board the craft and asked the captain if he would accept a boy as one of the crew.

"I would accept you," replied the captain, "as I am one hand short, but there is no time for you to go after your luggage."

"I'll go as I am," said Bill.

"I'll give you eight dollars a month, and it's a bargain," said the master.

"Very well."

"What is your name?"

"Bill; what is yours, sir?"

"My name is Captain Smart."

"Cast off the lines there," he called to his men; and before Bill had time to reflect on what he was doing, the Pandora was steering down Boston Harbor, whether on a long voyage or a short one, he knew not.

Poor Bill was very sick during four or five days after leaving port, and often wished himself at home. But as he began to recover, his determination returned, and he made up his mind never to return home until he should be able to make good his losses.

Days passed ere he took sufficient interest in the matter to ascertain that they were bound for New Orleans. The craft was off Key West, and one bright, hot day Bill saw the captain "take the sun." The process being explained to him, Bill took a slate and pencil and shortly had worked out the position of the vessel. His effort pleased the captain, and gave the youthful sailor a standing among his companions.

On arriving at the mouth of the Mississippi, the Pandora was taken in tow by a tug and carried up New Orleans. Bill saw strange scenes along the river, one of which was the negroes working in the fields of sugar-cane. Arrived at the Crescent City, the captain pushed the work of discharging his cargo, for he learned that yellow fever was in the city.

Bill risked a walk about town, fever or no fever. In Barrow Street he saw a sign—"Real Estate and Slaves." The building on which the sign was, showed age, and had a yard with a high wall attached. A door was standing open, and there was a strange group of men, white and black, within the yard. Bill entered to see what the place was like, and to observe the oddly-dressed characters. There was an auction-block, and on it were placed by turns negro men, women and children, and sold to the highest bidder. The sight made the boy shudder, and he walked quickly back to the Pandora, with no wish to see more of the Southern metropolis.

The schooner having been discharged and a cargo of molasses taken aboard, the trim little vessel was, in a few days from her arrival, partly drifting and partly sailing down the river on the return voyage. Before they were out of the Gulf of Mexico, the mate sickened and died of some sort of fever. The captain also was sick several days; and it so happened that Bill was the only well person on board who could take the sun.

A ship's chart is much like a map, and when the vessel's position is found at noon, a little o is marked on the chart to indicate the point, and a line drawn with a pencil to the o made on the preceding day. So that the track taken by a ship when marked down on the chart, looks more like a drawing of a fence than anything else. Bill was very proud when the captain appointed him to keep the log during the voyage; which was destined to be shorter than they could wish.

Off Nag's Head, not far from Cape Hatteras, on the North Carolina coast, a terrible storm burst upon the Pandora, and her sails were badly torn by the wind. The captain got up from his sick bed and was much on deck, for he could not rest in a time of danger. As night came on, with wind howling through the rigging, he felt in peril of being driven ashore. At length he saw what he believed to be a ship's light between them and the land, rising and falling with the motions peculiar to lights on vessels subject to the action of the waves. This sight reassured him, for, according to that, his position was a safe one, and he took courage.

But how were his suddenly revived hopes dashed, when one of the sailors ran aft and shouted in his ear, "Breakers! breakers ahead!" Immediately the Pandora struck, and the huge waves commenced pounding her to pieces. The captain's orders were scarcely heard or heeded. They tried to launch a boat, but it was crushed like an eggshell, and a wave that swept the deck carried away one of the crew. The masts had snapped like fagots and gone over the side; cracking sounds told that the vessel was breaking against the rock.

The other boat, a small one, was gotten out, and the crew leaped into it, all save Bill. As he was about to follow, a huge wave broke over him, and carried the boat beyond his reach. As he clung to the wreck, he saw the little boat lifted on one wave and another till, by the light of the moon that just then tried to break through the clouds, he beheld the boat bottom up. A moment more and all trace of it and its freight had disappeared.

Bill tried to consider what was to be done. The timbers were giving way beneath his feet; to linger was surely to perish. Throwing off his clothes, he plunged into the angry sea, that tossed him as if he were a bit of cork. He swam toward the land, and after a prolonged struggle with the waves, found himself in the surf, washed back and forth, his strength fast leaving him. At last he was so fortunate as to crawl out of the water and up the sandy beach.

Seeing a hut close at hand, he went to it. It proved to be the home of Evan O'Neil, fisherman and wrecker, who on being aroused, admitted the half-drowned lad and gave him clothes and food. Then without stopping to hear many particulars, he dashed away to the beach to secure whatever of value might have been brought in from the wreck, while Bill, utterly exhausted, fell asleep.

The vessel was a total loss. All the crew perished; but Captain Smart, having lashed himself to a spar, finally drifted ashore, more dead than alive. With a few days' rest, however, he recovered his strength and set off for Washington, where he had some influential friends, who obtained him a situation in the navy.

What of our hero and the wreckers? The latter gathered at the nearest point to the Pandora, but they got little booty and cursed the lost ship on account of the scarcity of plunder. Wild as these men were, the wrecked lad concluded to make his home with them till better days came. The truth is, he did not for some time understand the character of those he had fallen among. So, for more than a year and a half he shared the cabin of O'Neil, the youngest and smartest of the gang.

Many years ago, a man named Tom Rider was a leading villain of that class. He owned an old white horse that was known as Rider's Nag. To the head of his nag, Rider would attach a lighted lantern, then ride the poor beast, who hobbled, up and down the beach, the false light imitating the motions of a ship's light. It was in just this way the Pandora was led on to her destruction. How many ships have been cast away, how many lives lost on that fatal shore through such wicked practices, the world has no means of knowing. This explains how the place got the name of Nag's Head, which it has kept to this day.

When Bill became acquainted with the secrets of Nag's Head, he tried to break up the nefarious business; but without success.

One night the ship Rosa Duncan was, through the wreckers' lights, stranded on that inhospitable shore. Some of the sailors barely escaped with their lives. Captain Baine commanded the ship, and had with him on the voyage his wife and their only daughter, Kitty, a fine lass of fifteen summers.

Bill Lewis showed real bravery during that night of wreck, and rescued from an impending fate the captain, with his wife and child. The vessel and cargo were a total loss. When Captain Baine reached his home in Portland he did not forget the lad who had saved his life and the lives of those dear to him. One of his first acts was to send young Lewis a present of five hundred dollars. As soon as he received the money, Bill set his face homeward glad enough to part with those evil men.

Arriving in Boston he purchased a wagon and a span of horses superior to those he had lost, and having procured the very same list of articles he had been sent for two years before, drove home to Stoneham. Need I say his father and mother were overjoyed to see him? He had been given up as dead.

Bill was the lion of the day; but somehow, he disliked to remain in that quiet little town. He wanted to travel again, and see more of the world. Receiving a kind invitation from Captain Baine, he went down East and passed some time in the family of the prosperous mariner. Kitty Baine, the little blonde, was very charming, and soon Bill found himself, fathoms deep in love with the captain's daughter. The remainder is easily guessed. Years have passed; Captain Baine has retired from sea-life with a fortune; and his daughter is Mrs. Kitty Lewis. Mr. William Lewis, as he is now called, founded a happy home near Portland, which is none the less happy after these years. A conspicuous object to be seen in his parlor, is a picture of the place where his fortunes changed,—Nag's Head.—*The Watchman.*

DEAR UNCLE MARK:—Words fail to express my thanks for the seeds you sent, for we did not expect them. We sowed them the same day they were received, but as it was rather late, we did not sow all of the peppers or eggplants. Mother was afraid to venture with all of them as we live far North. We were weeding the Defiance Wheat to-day and it looks splendid. Father went to the potato field to see how the Beauty of Hebron potato was getting along, and he found the inclosed insect or beetle on the stake that was in the hill. I send it to you and ask you to tell me its name. Please publish this letter if you think it worthy of publication. Your thankful niece,

Bruce Co., Ont. ADDIE BURNHAM.

[The name of the beetle you sent me is Elater oculatus; it belongs to the spring-beetles Elateridæ. These beetles are peculiar for the power they have of jumping up when they lay on their backs. The name oculatus refers to the large, oval, velvet-black spot, like an eye, on each side of the breast, or thorax. The larvæ of this genus are called wire-worms from their slimness, their uncommon hardness and their brownish color, which give them the appearance of a piece of wire. Where they are numerous they are very destructive to vegetation, feeding as they do on seed when put in the ground, as corn, potatoes, etc., and also on the roots of plants. The best remedy is to expose them to the birds. UNCLE MARK.]

I AM a little girl, ten years old, and I live in the Willamette Valley. Father has taken the RURAL since I can remember. I have been reading the boys' and girls' letters, and like them very much. I have no pets except flowers and chickens. I want to tell you my studies at school: they are reading, spelling, arithmetic, geography, grammar and writing. A writer in the RURAL of April 5, on page 215, mentions a small book by Prof. Gray, called "How Plants Grow," and as I desire to study botany, I think that is the book I want. Please let me know where I can get it, and what it will cost. OLIVE WARD.

Warton Co., Oregon.

[You can get Professor Gray's How Plants Grow, of the American News Company, this city, or through this office. The price is 80c.—UNCLE MARK.]

The Puzzler.

CROSS-WORD ENIGMA.

My first is in grain, but not in rye,
My second is in pen, but not in sty;
My third is in north, but not in west,
My fourth is in bird, but not in nest;
My fifth is in gravel, but not in sand,
My sixth is in earth, but not in land;
My seventh is in arm, but not in leg,
My eight is in cent, but not in beg;
My ninth is in four, but not in five,
My tenth is in bees, but not in hive;
My eleventh is in short, but not in long,
My twelfth is in stove, but not in song;
My thirteenth is in quarter, but not in yield,
My whole is in a General, who died on the battle field.

☞Answer in two weeks. M. S.

MISCELLANEOUS ENIGMA.

I AM composed of 33 letters:
My 30, 29, 27, 3, 14, 19, 4, 7, 2, is to chew.
My 12, 8, 9, 20, 22, 1, is a Jewish coin.
My 31, 25, 32, 6, 10, 4, 21, 24, 26, 18, 29, 1, 14, 11, is a luminous phenomenon.
My 15, 13, 23, 11, 14, 19, is a medicine.
My 17, 28, 5, 2, 16, is to renew.
My 33, 9, 5, is to know.
My whole is a wise maxim.

☞Answer in two weeks. MICK.

A DIAGONAL PUZZLE.

1. A consonant: 2. Two vowels; 3. To move quickly; 4. Part of a slipper; 5. An oriental country; 6. An accident; 7. A slip on the ice; 8. First; 9. A tale;—Primals and diagonals from two fruits.

☞Answer in two weeks. L. O.

PUZZLER ANSWERS.—June 14.

HIDDEN PARTS OF A SHIP OR STEAMER.—1. Chains; 2. Hammock; 3. Deck; 4. State-rooms; 5. Steerage; 6. Office; 7. Gangway; 8. Galley; 9. Bowsprit; 10. Screw; 11. Engine; 12. Anchor; 13. Halyard; 14. Bulkhead; 15. Berth; 16. Scupper; 17. Scull; 18. Taffrail; 19. Logline; 20. Luff; 21. Keel; 22. Rigging; 23. Bowline; 24. Jib; 25. Bullwarks.

A FRACTIONAL PUZZLE.—"Anna Arundal."

SILENT SONGS.

WHEN the song's gone out of your life
That you thought would last to the end;
That first sweet song of the heart,
That no after days can lend—
The song of the wind to the trees—
The song of the wind to the flowers—
The song that the heart sings low to itself
When it wakes in life's morning hours.

You can start no other song;
Nor even a tremulous note
Will falter forth on the empty air—
It dies in your aching throat.
It is all in vain that you try,
For the spirit of song has fled;
The nightingale sings no more to the rose,
When the beautiful flower is dead.

So let silence softly fall
On the bruised heart's quivering strings;
Perhaps from the loss of all you may learn
The song that the seraph sings—
A grand and glorious psalm
That will tremble and rise and thrill.
And fill your breast with is grateful rest
And its lonely yearnings still.

DID SHE LOVE MOST?

IT was a sore affliction to Mary and Martha when Lazarus, their only brother, sickened and died. Desolate now was their home, and greatly did they long for the presence of Jesus, their best friend, with them. And now at length he draws near. His coming is announced, and Martha immediately goes out to meet him. Her first words to him are: "Lord, if thou hadst been here, my brother had not died." And Mary kept her place. "She sat still in the house." She waited there till her sister returned and called her secretly, saying: "The Master is come, and calleth for thee." And as soon as she heard that, she arose quickly and came unto him; and as soon as she was come where Jesus was, and saw him, she fell down at his feet, saying in the same words of Martha, "Lord, if thou hadst been here, my brother had not died."

Was it that Martha loved Jesus more than Mary, that she was more forward to go out to meet him? Was this a demonstration of more ardent affection? We can hardly think so. We are assured that "Jesus loved Martha and her sister;" and they both loved him in return. His love was reciprocated, and it was sincere on the part of both. But we regard it as no certain proof that the love of Martha was superior to that of Mary, that she so promptly sprang to meet the Saviour as he approached. We are differently constituted. Our natural temperaments are unlike. One person manifests his love in one way, and another in another. So was it with these sisters; and we doubt not that Jesus, who knew all men, saw that Mary loved him not less than Martha. It may have been that he saw that she loved him more.

And so, too, in the case of Peter. It may have been that Jesus saw that he loved him no more than the other disciples, who were less demonstrative. He was foremost to say to the Saviour: "Though I should die with thee, yet will I not deny thee." And when, after his resurrection, the Saviour appeared to his disciples as they were engaged in fishing, and John said unto Peter, "It is the Lord," it was Peter who, first of all, rushed to meet him. But was this certain proof that he loved him more strongly than James and John and the other four dicipics, who remained at their post, dragging the multitude of fishes that they had caught, to the shore? We are by no means sure that it was so. Peter was naturally impulsive; he was a man of quick and ardent feelings; and yet this love may have been no deeper and stronger than that of his more quiet brethren.

If we judge by the forwardness of men, we may sometimes make mistakes. In a prayer meeting there are those who are always on their feet. Give them the opportunity, and they are always prompt to take a part. They can't keep quiet. It were much more of a cross to them to keep still, like Mary, than to rise up, as did Martha. And yet they may, in fact, love no more than the brother whose voice is rarely heard. Were the matter brought to a test, the latter might stand it better than the former. It was John, and not Peter, who stood firmest in the hour of fiery trial; and who can say but that the same might have been the case with the gentle Mary? "I cannot plead for Jesus," said a diffident lady before an examining church committee, "but I could die for him."

HOW THE APOSTLES DIED.

1. Peter was crucified in Rome, and, at his own request, with his head downward.

2. Andrew was crucified by being bound to a cross with cords, on which he hung two days, exhorting the people till he expired.

3. St. James the Great was beheaded by order of Herod, at Jerusalem.

4. St. James the Less was thrown from a high pinnacle, then stoned, and finally killed with a fullers club.

5. St. Philip was bound and hanged against a pillar.

6. St. Bartholomew was flayed to death by command of a barbarous king.

7. St. Matthew was killed with a halberd.

8. St. Thomas, while at prayer, was shot with a shower of lances, and afterward run through the body with a lance.

9. St. Simon was crucified.

10. Thaddeus, or Judas, was cruelly put to death.

11. St. Matthias; the manner of his death is somewhat doubtful: one says stoned, then beheaded; another says he was crucified.

12. Judas Iscariot fell, and his bowels gushed out.

13. St. John died a natural death.

14. St. Paul was beheaded by order of Nero.

PERSONAL ITEMS.

Senator Matt Carpenter's daily smoke is raised to thirty cigars and a pull at his pipe between times.

General Hickenlooper, the Republican candidate for Lieutenant-Governor of Ohio, began business life as a printer's devil.

Brother Wong Ching, in full Chinese dress, officiated as a deacon at a Congregational communion-service in Hartford. He is a deacon at home in China.

General Hazen, having failed to establish his military record to his satisfaction in a military court, is now to try a civil court and has sued General Stanley for libel.

W. W. Corcoran, the aged banker and philanthropist of Washington, fell this week, breaking his arm and bruising his head, and it is feared that his injuries are serious.

For want of tenants, Sir John Ramsden, who owns Huddersfield, and has an income of $500,000, has been compelled to take six of his huge Scotch sheep farms into his own hands.

John Brown, jr., is going to Kansas to help colored refugees just as soon, he says, as he can get his crop in and in shape, so that he can reasonably hope to keep the wolf from his door while he is absent working for others.

Mr. Weisert was a member of a New Orleans Grand Jury that formally requested the judiciary to enforce the law against concealed weapons. On the following day he was arrested with a revolver in his pocket and fined $25.

James C. Flood draws $62,500 from the National Treasury four times a year, that sum being the quarterly interest on $5,000,000 invested in five per cents. It is said, moreover, that he recently has put another five millions in four per cents.

"Marion," asked young B. J. R. Smith, in that style which a big brother assumes when patronizing a little sister, "do you know that the earth turns round?" "Of tos I does," answered Marion, resenting the imputation of ignorance; "that's the reason I tumbles out of bed."

The will of Garrison gives $300 each to his four sons and daughter for their children, advising that the money be kept in savings banks until the young ones grow up. The rest of the estate, which is not large, is divided equally among the five, except $500 to Berea College, an institution for negroes.

Henry Van Amburg of Howells, N. Y., sold his wife to Joseph Wood for $6, and that would have been the end of the matter, probably, if the woman had not, while drunk, been killed by a railroad train. Both husbands claim the right to sue the rumseller under the Civil Damages Act, as her husband.

Of the leading candidates for the Presidency, Grant is 58; Hayes, 58; Sherman, 56; Conkling, 51, and Blaine, 48. On the Democratic side, Thurman is 66; Tilden, 65; Davis, 64; Hendricks, 60; Bayard, 51. Grant and Hayes were born in the same year, 1822. The average age of the Republican candidates is 54 years, and that of the Democratic 61.

Mrs. Von Lohr, being deserted by her husband in Cincinnati, decided to commit suicide. She laid herself on a bed and fired a bullet into her head. The wound did not cause death, or even unconsciousness. After waiting awhile in vain for the desired effect, she got a hand-glass, lay on the bed, and by means of the mirror shot carefully at her head again. Notwithstanding all this, she lived for several days.

Alanson Stephens was a night watchman at Hunter's Creek, Mich. Approaching his own house while on duty, he saw his wife and John Howe sitting close to a window. They were planning to elope, as he learned by eavesdropping. He shot Howe on the spot, but not fatally. Then he sat down and wrote a long account of the affair, the work occupying two hours, after which he shot his wife, and killed himself. The wife will recover, but says she does not deserve to.

An aeronaut calling himself Count Henri de Gilbert, was to make an ascension in Cincinnati. He stepped into the basket when all was ready, and then leaned over the edge to kiss his wife. Then he kissed another woman, and so heartily that his wife was furiously angry. The balloon was cut loose, and as it went up Count Henri saw that his jealous wife and the other woman were fighting. The spectacle disturbed his presence of mind, and he permitted the balloon to collide with a chimney. A rent and collapse were followed by a quick descent, but the Count was only a little bruised by the fall. His feelings, however, were seriously hurt.

What's the matter with the children, anyhow? In Boston, on Thursday afternoon, Owen Monahan, aged thirteen, fatally stabbed his playmate, Fred De Cain, aged twelve years. It was a spat about a boat, and the jack-knife was used. On Monday afternoon Joshua Squires, aged eleven years, of Sullivan, Tioga County, N. Y., was shot and killed by a nine-year-old son of Gulusha York. There appears to have been no offense in this case, as in that of Charlie Norris, the Rohrersville, Md., lad, who was shot and killed by Lewis S. Miller, because the latter boy had been teazed. Little Frank Williams, a lad of thirteen years, has just been on trial at Aiken, S. C., for the murder of a colored boy who was known as Boisy Bell.

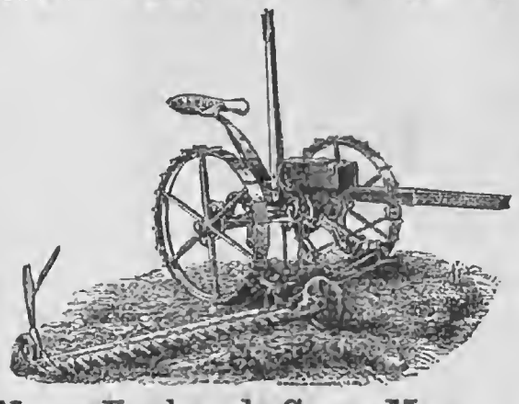
Corbett, the man who recently tried to assassinate several Catholic priests in New Orleans, and who is now in prison, is a brother of the Duke of Edinburgh's assailant. On the 12th of March, 1868, while the people of the town of Wooloewooloo (it's cheaper to whistle or grunt that name than to speak it), in New South Wales, Australia, were honoring the Duke of Edinburgh with a reception, Michael O'Farrel shot the Duke in the left side. O'Farrel was hung within forty-eight hours, much to the regret of the Duke, who afterwards learned that the poor fellow had been more or less crazy all his life. Michael had a brother and sister, who came to this country after the Australian row. The sister is now the superioress of a convent in New Orleans. The brother changed his name at the sister's request.

The late Baron Lionel de Rothschild, the head of the English house of Rothschilds, was a man most generous in giving. Enormous as his income was, it is said that more than a tithe of it was applied in charitable works. He never proclaimed his charities, however, and often made it a condition of a gift that it should not be published. Bound as he was to his seat by physical suffering, which made his manner varying and sometimes harsh, so that the temper of Baron Rothschild grew to be something watched like the weather for its influences on the Stock Exchange, he found his relaxation in giving, and his eyes glistened when he heard that his alms or influence had been beneficially bestowed.

Remember that a little Hop Bitters saves Big Doctor's Bills, and cures when all else fails.

Implements and Machinery.

WALTER A. WOOD'S



New Enclosed Gear Mower.

ONE AND TWO HORSE.

For Simplicity, Lightness, Strength and Durability this Mower cannot be excelled. It is less complicated, easier to repair, and less liable to get out of order than any other machine. Its weight is reduced to a minimum consistent with maintaining the greatest efficiency in handling the most difficult crops.

WALTER A. WOOD'S

New Sweep Rake Reaper.

[2 Sizes—5 feet and 5 feet-6 inch cut, with and without Mowing Attachment.

with new Automatic device for controlling the rakes. This is the most perfect, lightest draft, and stillest running Reaper made.

Wit and Humor.

A LADY remarked to a popular divine that his sermons were a little too long. "Don't you think so?" said she—"just a little?" "Ah, dear madame," replied the divine, "I am afraid you don't like the sincere milk of the word." "Yes, I do," said she; "but you know the fashion, nowadays, is condensed milk."

Fresh Supplies of Vitality

To renew a waning stock may be gathered from a source accessible to all, and never sought in vain by any whose constitution and vigor are not so much dilapidated as to be wholly past repairing. Evidence direct, convincing and ample, indicates Hostetter's Stomach Bitters as a tonic of unexampled efficacy and perfect purity, and possessed of properties that constitute it an invaluable remedy for dyspepsia, constipation, liver complaint, urinary and uterine weakness, rheumatic complaints and malarial fever. Delicate females and infirm old persons are invigorated and solaced by it, and the physical prostration which usually follows a severe illness is in a great degree remedied, and convalescence accelerated through its use. It occupies a leading position among medical staples.

Battle Creek, Mich.
ORIGINAL AND ONLY GENUINE
"VIBRATOR"
THRESHING MACHINERY.

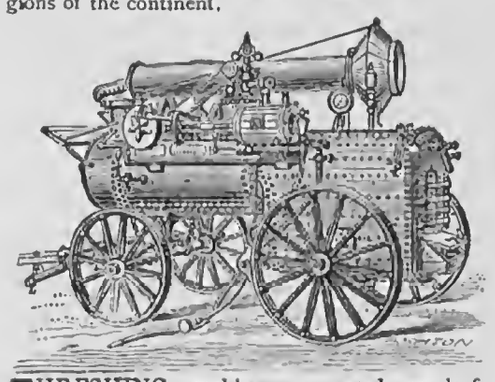
WE are sometimes asked why the prices of our goods are apparently higher than some others of inferior make, and we avail ourselves of this opportunity to place the matter in its true light.

OUR "VIBRATOR" Threshers and Portable Engines embody the best results of our experience and study during our long business career. Whatever would add to their durability, efficiency, and solid excellence, in any particular, has been eagerly seized upon and utilized without regard to labor or expense.

IN this connection it will be pertinent and timely to warn the public against **Cheap** Threshers and **Cheap** Portable Engines. The superiority of our machinery, in all particulars, is now so generally acknowledged that our competitors have no resource but to present the attraction of low prices and long credit. Their goods being inferior, they have to sell them for what they can get. Times are hard; and purchasers, without fully considering the subject, will sometimes allow a lower price to decide them. Manufacturers of "cheap" machines are so set on carrying out competion to its utmost—competition of **Cheapness**, not of Excellence—that they meet "bargain hunters" half way, and furnish them cheerfully with inferior machines at the cheap rate they are asked for.

WE are much mistaken if this is what the public wants or expects of us. Good machinery cannot be made when neither workman nor employer has pride in his occupation; interest and pleasure in the work are both wanting, and both are essential in making good machinery.

OUR mission and business is, to build Threshing Machinery **of the Highest Excellence,** whatever the cost, and, holding firmly to this single purpose, we have added improvement after improvement, until the reputation of our Machines has become co-extensive with the grain-raising regions of the continent.



THRESHING machinery cannot be made for nothing, even with the aid of machinery. Our prices are as low as they ought to be, and, without doubt, as low as they ever will be. Do not be deceived with mere cheapness—**quality always descends faster than price.** Low price, especially in Threshers and Portable Engines, means **Low Quality, with Low Performance and High Repairs.**

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. XXXVIII. No. 27.
WHOLE No. 1536.

NEW YORK, JULY 5, 1879.

PRICE FIVE CENTS.
$2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington. —Entered at the Post-Office at New York City, N. Y., as second-class matter.]

Horticultural.

THE STAGGERBUSH (Andromeda Mariana).

The engraving is a very correct representation of this handsome shrub, the specimens for which we collected a month ago, while riding through sandy woods near the beach, a few miles from the Rural Farm. Many plants were growing thickly together, from 18 inches to two feet in hight, and the thousands of white, drooping, urn-shaped flowers were a pleasing surprise in a district which is never overburdened with floral treasures. This plant is quite common from New York to Florida. The leaves are deciduous, somewhat leathery and of an elliptical shape, acute at both ends. The flowering branches are nearly leafless and as they extend above the flowers, detract somewhat from its value as an ornamental shrub. These cut off, the large nodding flowers in graceful fascicles are valuable for bouquets as they endure well, and the entire plant is one which is worthy of cultivation. It will probably require a shady place and a soil as free as possible from lime.

THE POISONING OF WEEDS AND INSECTS.

Gardening is such an innocent occupation, so promotive of gentle thoughts and ways as to make the idea of using poison even to destroy vermin, produce a shudder of reluctance, at first thought of it. But the survival of the strongest and the fittest is the oldest earthly law. The most ancient marine fossils,—the old Silurian fishes disentombed by Hugh Miller from deposits of incalculable antiquity —show that even before there was dry land or bird or beast, the stronger fishes were qualified and purposely fitted, privateer-like, to prey upon their swarming inferiors. "Self-preservation is the first law of Nature." This adage may have a selfish sound, and is no doubt perverted in application for selfish ends, but it justifies our modern methods of quick extermination to the enemies of the crops which the earth gives us only at the cost of resolute and persevering struggle, and skill. I have just been giving rose bushes a second and currants a third syringing with a dilute infusion of hellebore, using a brass syringe with the rose which gives the finest spray. It is quick sure death to the voracious larvæ, and it leaves the foliage clean, whole, bright, and competent to bring the blossoms and the the fruit to full perfection. It seems effective too, against the white leaf-hoppers that infest Roses and Grape-vines, and suck the juices from their leaves.

With a good brass syringe—an invaluable house and garden instrument—it is easy to keep foliage whole and bright. Such materials as mix intimately (as Paris-green, or sulphur, or soot, or kerosene, with water) are easily churned and foamed into a thorough temporary admixture, and then most easily sent into every crevice and corner in which insect or mildew can lodge, with a force, speed, and directness, too, that nothing else equals. Carbolic acid is now recommended for paved yards etc, where we once strewed salt, to be annoyed with its deliquescence long afterwards; and where we found it look still worse to have a poor woman or boy all day spudding the grass bit by bit from the chinks with an old knife. In contrast to such methods, the application of a spray of very dilute carbolic acid, during sunshine, is a very brief and easy job, and is said to be entirely effective. For strong single weeds in lawns, a drop or two of strong acid is spurted from a little oil-can upon the crown of the plant, which may be pierced with an iron point the better to receive it.

W. G. Waring.

What the Rural said last year of the Golden Defiance Strawberry has been corroborated.

GARDENING ABOUT CHICAGO.

The business of gardening about Chicago is mainly in the hands of Germans. The land

STAGGERBUSH.

south and west is not adapted to garden culture. To the north are low-lying sand-belts and ridges, and considerable prairie, well adapted to garden culture. The light, sandy soil requires liberal manuring, and his it gets on its way in with garden truck, and on its way out with a well-piled load of stable manure. The winter, however, is the great season for manure-hauling. At that season the roads are generally frozen hard for months at a time, and long trains of manure wagons pass in and out every day. These very frequently take in a partial load of cabbage, potatoes, or some other kind of garden produce.

The marketing requires a great deal of time and attention. I am writing eight miles out, and during the summer, autumn and early winter, at almost any moment during the last half of the night, wagons may be heard rolling into the city, full-loaded. These are generally back in the garden again by noon, ready to be re-loaded for the next day. The business is divided into three branches, namely, truck gardening, including the production of all garden vegetables mainly grown in the open air, as peas, potatoes, tomatoes, etc.; hot-house gardening, producing lettuce, cucumbers, radishes, etc., under glass, by artificial heat—generally steam or hot water; and the production of flowers. These are grown in large quantities all through winter, and of course find a ready market.

The gardens are now just beginning to look gloriously beautiful. During every hour of daylight the workers of both sexes may be seen planting, digging, weeding, etc. The succession is ingeniously managed, and much of the land produces two or more crops per year. The early peas are now going forward. The ground occupied by them will be used for late sweet corn. The early potatoes will be followed by turnips, and so on—a dressing of manure generally preceding each planting. The business is profitable. Those following it are gathering estates—indeed, becoming wealthy—but they earn every dollar they make, and are not cultivated in mind or manners half as well as they cultivate their gardens.

W. H. Gardner.

CITY GARDENING.

There are more possibilities in a small city yard than are generally estimated. In St. Louis I tapped the water pipe that ran through my cellar, just inside the wall; then bored through the earth in my yard till by removing a stone in the cellar wall, an inch pipe was run down and soldered to the main pipe. With a faucet the water could be turned on or off at pleasure. Then with a fine nozzle attached to the upper end of my pipe, I could throw a handsome jet ten feet high—at night twenty feet. Around the pipe I built a rockery and set its niches full of flowers. The show was lovely, the spray cooling, and at night the sound of falling water was exceedingly refreshing and soothing. Of course, the water must be paid for; but enough could be had for twenty dollars, or even ten, to keep the fountain in operation mornings and evenings.

It does not pay to undertake too much in a city yard. The Wistaria thrives admirably for a vine, as do Honeysuckles. The best of all bedding plants for a sunny yard are Geraniums. The Gladiolus is one of those glorious helpers that do well everywhere with little care. The main object is always to have something that will look bright and fresh and suggest the country. A lovely shrub for protected positions, especially for yards facing to the north is the Mahonia, a rich glossy evergreen; the young growth of yellow and red, and a very neat bloom. The Hydrangea hortensis is exceedingly useful. The Snow-ball in shady locations becomes infested with black aphis, and is useless. One neat evergreen well grown is always preferable to half a dozen crowded or sheared enormities. One good tree or one fine shrub is better than several stunted. The trouble mainly is the effort to do too much in a small space

E. P. Powell.

Weevil-Eaten Peas.—Will they grow or will a majority grow? What proportion will grow? One farmer tells us that there is one kind of pea that will not grow unless it *is* weevil-eaten! All unite in contradicting the result of the Rural's experiment.

Pomological.

TASTE AS APPLIED TO FRUITS AND VEGETABLES.

S. B. PECK.

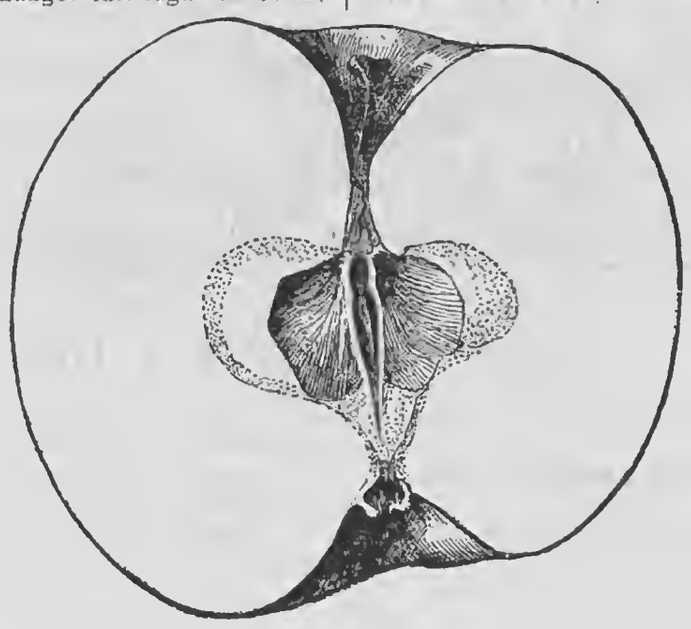
It has been said "there is no accounting for tastes." This may be true in the main, but I think there are many, if not a majority, of the eccentric or abnormal cases that can be traced to a whim, a disordered imagination, or to somebody's remark, that the food was specially healthy or unhealthy. It is most certain that the imagination has much to do with the flavor or supposed flavor of substances taken into the mouth. Cases are related where simple bread pills have caused violent vomiting, when taken under the impression that they were a nauseous emetic, and patients have been known to take easily every day for a week medicines that their stomachs would not have retained a moment had they known what they had taken. And, singular as it may seem, those who have the most confidence in their own ability to detect any such imposition, are often deceived the most easily.

The Baldwin apple has a very high reputation among apple growers, and, of course, among nurserymen who supply them with the trees. So great is the reputation of this apple that several, when asked what kinds they would recommend for an orchard of 100 trees, have answered: "Ninety-nine Baldwins and the odd one another Baldwin." But is it because of any peculiarly delicious flavor of the fruit? No! if tasted in the dark, most persons would, from the mere taste, prefer the Swaar, Peck's Pleasant, Spy, Red Canada, and several of the Pippins, and perhaps the Greening and Spitzenberg. The reputation of the Baldwin is derived, not from any fine flavor, but from the vigor and thriftiness of the tree, the fairness and fine appearance of the fruit, its good handling and keeping qualities; but, most of all, from its extraordinary productiveness, in which, as far as dollars and cents are concerned, it is doubtless superior to any other of the long-tested varieties. Such being the case, those who raise apples for profit, show good judgment in planting largely of this variety, but the consumer, when he goes into market to select fruit for family use, does not show good judgment when he gives a preference in choice, and many times in price, for the Baldwin, simply because of its high reputation. Even the Pennock—about the poorest of all good-looking apples—I have seen selected for home use, because there was stamped on the barrel head, "Baldwin." My object is not by any means to decry this apple, but to show upon what foundation opinions and tastes are formed.

In grapes and other small fruits, it is well for us to consider which of their constituents it is that gives them their luscious flavor, their cooling and thirst-allaying effects. Without going into the naming of the many simple elements of which they are composed in common with all fruits, we may say that what gives them their peculiar relish is a certain proportion of acids, sugar and water. Admitting this to be true, we would suppose, as the office of water is simply to dilute the other ingredients, that those varieties which contain the most sugar and acid would be the most palatable and nutritious, the richest and most satisfactory to the appetite. They certainly contain, per bulk, more of the elements of nutrition, but I think they are not generally preferred as table fruits—and why?

Dr. Grant and Mr. Meade have much to say about the "education of taste," and I must admit that there is much in it, for I have noticed that those persons who have never been fully supplied with our common fruits, see little difference in the different varieties of the same kind. What constitutes the sweet or sour taste of our fruits is not the absence of either of the compounds, but the predominance of one over the other. Of strawberries I have never seen an analysis of different varieties, but my own opinion, judging from what I have seen and tasted, is that the Wilson is at about the hight of richness in sugar and acid, and that when you go above that in size, you get simply an addition to the water, and if you like the larger kinds better because they are less acid, is it not because the sugar and acid are simply diluted? The Concord grape admitted to be "the grape for the millions," but so far as the fruit elements, sugar and acid, are concerned, it is weak, especially in the former, consequently it lacks flavor, and, as compared with many others, it is simply diluted. The Clinton is called by many a poor, sour grape, but in these fruit elements it is one of the richest. I have the analyses of 38 varieties of Northern grapes, in which the Clinton contains the most sugar, almost double that of the Concord, but it also contains over three times as much acid. I do not wish to quarrel with those who cannot bear sour fruits, and who think that excellence in them consists solely in their sweet flavors, but richness in these fruits is certainly a desirable quality, if we can educate our tastes up to a relish of them.

We gather and eat our fruits before they are ripe; the ripening process in fruits consists largely in the transformation of acids into fruit or grape sugar. We of the laity are not expected to be chemists, but if we look into our childrens' school books on chemistry, we shall see that these fruit sugar and acids, are composed of the same elements, differing only in their proportions. Nature is a great chemist. In the green corn she puts sugar, in the ripening process she changes this sugar to starch,



STUART'S GOLDEN APPLE.

but when you plant this corn for a new crop, about the first thing she does is to change this starch back again to sugar, to give nutriment to the new plant, which starch cannot do. So when we eat this ripe corn, nature seizes upon its starch and changes it to sugar before it can act as nutriment to the system. This fruit sugar, however, is not the same article that we suppose we buy for the table, but the kind with which the sugar refiners are now charged with adulterating or rather diluting the common sugar; namely, glucose, or fruit sugar, it being precisely the same as our table or cane sugar, with about ten per cent. of water chemically combined with it.

Muskegon Co., Mich.

THE APPLE IN CALIFORNIA.

MARKETING THE APPLE CROP.

The apple is one of the most popular of all fruits in California, which possesses a climate and soil unsurpassed for the favorable production of this fruit. The foot-hills of the Sierra Nevada constitute the great apple section, although apple trees are cultivated and thrive well in nearly all parts of the State. The flavor of the foot-hill apples, however, is much finer than that of those grown along the coast, while the valley apples are mealy and lack the sprightly acid taste of those from the foot-hills.

Fruit-growers, however, in the foot-hill section labor under the disadvantage of being far from the San Francisco market. From our large apple orchards much of the fruit is shipped to that point, although a considerable quantity is shipped to Nevada. In shipping to San Francisco, even with regular telegraphic communication, it is difficult to know exactly when to ship; for as fruit is sent there from all parts of the State, it is quite difficult for our orchardists to watch the markets closely enough to enable them to get their product in when it would realize the fairest figures. If the fruit arrives when the market is active and not overstocked, it is quite sure to fetch a good price; while, on the other hand, if by sudden and large shipments from other sections, the markets have been overstocked, the fruit is almost a dead loss to the shipper.

Immense quantities of apples are annually dried, and last season the amount disposed of in this manner has been fourfold greater than in any former season, owing to the introduction of numerous patent driers. Although such immense quantities have been shipped and dried, hundreds of tons have been fed to hogs or allowed to rot on the ground.

VARIETIES.

Every section of the country, every locality, has a climate peculiar to itself, so it will be found that every clime will have its own peculiar kinds of fruits, which will attain the highest degree of perfection there only, and will lose some of their good qualities as soon as removed elsewhere. It is impossible to decide the varieties suitable for one clime by those that thrive in another. Early spring Eastern apples, for instance, become summer ones here, Eastern autumn apples change into winter, and of real winter or subsequent spring apples, we have very few.

Early Apples are cultivated only in quantities for the local trade. Red Astrachan is the favorite for either eating or cooking purposes. Early Harvest is a good variety for eating, but remains for such a short time in perfection that it is not cultivated much. Red or Early Junes are in fair demand, and as a succession to Red Astrachans are cultivated in fair quantities.

Summer Apples are cultivated in small quantities being, as a general rule, poor shipping apples. Golden Pippin is in fair demand, being a very tart and highly flavored apple, making it desirable for cooking and drying. Maiden's Blush and Gravenstein are also used for these purposes, the latter being, however, the most desirable for eating.

Early Winter or Fall Apples are always in good demand and are grown extensively. They realize fair prices. The favorites of this class are Belle-Fleur, Jonathan, Rhode Island Greening, Fall Pippin, Santa Clara King, Gloria Mundi, Smith's Cider and Winesap.

Late Winter Apples are in good demand. Those in general cultivation are the Yellow Newtown Pippin, White Winter Pearmain, Nickajack, Large Striped Winter Pearmain, and Baldwin, Swaar, Beauty of Kent and Esopus Spitzenberg.

CULTURE.

The wonderful crops first obtained from California soils gave our farmers an idea that good culture was unnecessary. The same idea got into the heads of orchardists and as a result we find, in many cases, that beyond irrigation, few aids are given to nature. No manure at all, or very little is used. The trunks are seldom scraped or washed, and beyond picking off a few of the thickest, very little else is done to promote the value of the fruit. The days of this style of fruit-growing are past, however. The poorer fruit is rapidly being grafted and good culture is becoming the rule.

The Apple Crop of 1878

was the largest ever known in the State. The quality was very fine in all varieties. I have seen numerous specimens that would weigh two and three pounds apiece, and, as a rule, the size was above the average in all varieties.

Eldorado Co., Cal. W. C. L. Drew.

STUART'S GOLDEN APPLE.

Of this Apple, Mr. Charles Downing writes us: "The specimens of this apple were sent me by J. R. Black, of Bremen, Fairfield Co., Ohio, who informs me that it originated on the farm of William Stuart of that county. The tree is hardy, a good healthy grower, spreading, an early and abundant bearer on alternate years. Fruit, rather below medium in size; oblate, sometimes slightly oblique; skin, bright yellow, with a shade of orange red where fully exposed, and a few brown dots; stalk, short, small; cavity, medium, rather deep, often slightly russeted; calyx, small, closed; basin of medium size, saucer-like shape, slightly plaited; flesh, whitish, or whitish yellow, half fine, tender, juicy, pleasant sub-acid, rather rich, and of very good quality; core, small; in its best condition from February till April. I think it worthy of notice."

Farm Economy.

CHANGE OF SEED.

T. F. FORFAR.

In the Rural of Feb. 15, it is said that "although a man may be a good farmer, and have continued to improve his seed grain [we did not say *grain*.—Ed.] for many years in succession, he will gain a large percentage by procuring seed from another locality and of the same variety as his own, and mixing the two together." It is further said that "this is no mere guess-work, or theory, but is the result of a long series of experiments by Mr. Charles Darwin, and corroborated by Professor Beal."

Now, I have read most of Mr. Darwin's works, but this I have not seen; consequently, the above extracts are all I have to guide me, and the statement appears so strange to me that I must beg to doubt its truth. If it is true, then the percentage gained must result from either of two causes: First, that the mixed seed will be crossed or fertilized one by the other, and so be made more productive than the original improved seed; or, second, that the mere presence of a plant from seed procured at a distance will have a beneficial influence on plants from the improved seed. In regard to the first cause, I do not think there is any difficulty in proving that no mixture or crossing will take place, and consequently there can be no gain from that cause.

If any of the readers of the Rural will go into their wheat fields next spring and examine a few heads of wheat, commencing their examination as soon as the head shows itself and continuing the observations until the stamens fall, they will find that fertilization *always* takes place before the chaff opens, or before the stamens, or what farmers call the blossom, can be seen on the outside of the chaff. This blossom is merely the cast-off stamens, their duty being done usually from twelve to thirty hours before they make their appearance on the outside. They will also find that up to the time these stamens are cast off, the chaff is quite close—so close, in fact, that it is impossible for pollen from another plant to enter, unless by accident the chaff should be opened by some extraneous cause, such as birds, or striking against some hard substance. Even then the chances are not one in a thousand that cross-fertilization will take place in any of our cereals. Artificial fertilization requires the greatest care and patience to make sure of even a very small percentage of crossed seeds; and although I have practiced it, more or less, for the last fifteen years, I consider that I do well if I succeed in getting twenty or twenty-five per cent really crossed.

Again, if we consider the second supposed cause, we find that plants do not create a particle of matter, and therefore do not originate in themselves any of the elements which compose them, nor does one plant exhale any constituent that is available for another plant of the same variety, when placed under the same circumstances; consequently one plant cannot act as a manure to another of the same variety while growing side by side. It may be true that seeds of entirely different varieties, such as peas and oats, mixed and sown together, will produce a greater yield, but the cause of this is well known—they absorb different elementary constituents from the earth. Peas contain more than double the quantity of nitrogen that oats do, while oats have the more carbon; peas most oxygen, and so on. Peas also absorb the greater part of their constituents from the air [?—Eds.] while oats derive most of theirs from the earth. This being the case, peas and oats really interfere very little with each other, and each has, therefore, more room than where the same quantity of either grain is sown alone. Now, where the same variety of grain is sown, each grain requires just the same elements, and acquires these elements in just the same way, either from the earth or air.

But it may be said that I am quite astray as to the cause of the increased yield; that the change of seed from one locality to another is the cause. Then why mix your own improved seed with that procured from a distance, as there would be a still greater increase by sowing the latter unmixed. If Professor Beal, or any of the Rural readers will take the trouble to make the following experiments, he will find that not only will there be no increased yield, but a serious decrease: Select the largest heads from the most prolific plant, and from these select the very largest grains, and sow. The following year do the same from the seed grown from the selected seed. Continue this selection for four or five years, and then procure ordinary seed from a distance and mix with the selected seed. A decrease both in quantity and quality will surely be the result.

Where this selecting process is continued from year to year for a length of time, a wonderful improvement will be observed, notwithstanding the fact that the grain has always been grown on the same farm. This improvement, by selecting the most perfect seeds, holds good in all plants. Where turnip seed has been screened, and the large and small seeds sown separately, but side by side, the large seed will produce the best turnips and the greatest yield. I might mention many experiments to increase the productiveness of our cereals, but this would be wandering from my text and making the sermon too long.

In conclusion, I may say that without further proof I will not believe *this* doctrine of Mr. Darwin's any more than I believe *another* statement of his—that any of my remote ancestors were either monkeys or frogs; but I do believe that where a farmer has improved his seed, either in the way I have mentioned or in other ways, if he change his seed he generally suffers a loss in quantity and quality, and frequently has a gain of a complete stock of weeds.

Ontario, Canada.

[It may be presumed (1st) that the seed procured from a distance would have also been improved by selection, and (2d) that we refer only to varieties of plants which do mix without artificial aid.—Eds.]

GOOD SEED VS. POOR.

Seed may germinate and yet be very poor. Ont-door tests are consequently of much more practical value to the farmer than those made under cover. Seed, to be good, must not only germinate, but must produce strong, healthy plants. My attention was called to this more particularly this spring than ever before. I procured melon seeds from two different firms and planted them in the same field. Of that from one firm, 45 per cent. germinated; of that from the other, 70 per cent. The second lot of seed, though planted two days later than the first, came up as quickly and produced stronger, healthier and faster-growing plants than the first lot. This difference in the growth of the plants will be seen throughout the summer. A great deal of the future value of the plant depends upon the start it receives. It does not pay to plant poor seed, and attempt to make up by quantity what it lacks in quality.

V. J. EMERY.

Henry Co., Ohio.

Farm Topics.

NOTES FROM THE RURAL FARM.

JUNE 19.—Three of us have been to work planting a lot 114x245 feet, or about two-thirds of an acre for the past three days. It might have been planted in half the time. The older we grow, the more we are convinced of the wisdom of that good old adage: "What is worth doing at all is worth doing well." Such sayings which are repeated daily, though conveying solid chunks of wisdom, lose their force from familiarity and, like logarithms or interest tables, the cost of formulation is rarely considered. The cost of disregarding its teaching is nowhere better exemplified than in some portions of this farm. We have no orchard worthy of the name. If, 13 years ago, when the farm was purchased, suitable fruit trees had been selected and properly planted, we should now harvest plenty of apples, pears, peaches and even plums and cherries in favorable seasons. Instead, however, fruit trees were ordered of traveling agents or of careless nurserymen, and when received, were planted rather as if to ascertain how soon they could be disposed of than with any consideration of their future welfare or of the objects of planting them at all. The consequence is that there is not one healthy, *creditable* fruit tree upon the place. The only remedy is to dig up and burn every one and begin anew, in which case, it is doubtful if the present proprietors would live to see their second orchard in profitable bearing. We say to our friends in all sincerity—"Do not plant orchards, or grape-vines, or small fruits unless you are willing to provide in every way for their health and longevity; for, otherwise, they will never prove a paying investment and must always prove a source of annoyance and regret. Better, by far, concentrate your energies upon those farm crops which you have learnt by experience *must* receive due care in order to yield a profitable harvest."

We have said our plot of two-thirds of an acre might have been planted in a day and a half, instead of three days. But the question to be answered was this: The cost of employing three men three days was nine dollars—for a day and a-half, it would have been half that amount: would the increase of crops compensate for the greater time and cost of labor? As there is a limit to the profitableness of manuring the land, so there is a limit to the time we can afford to give to the preparation of the land and the cultivation of the crops raised. But there are certain rules which are as plainly defined as those which guide us in any other work, and we cannot disregard them without paying for the neglect more than their observance would have cost us. In one corner of this little field, a plot 33x33 feet was sown to Cat-tail ("Pearl") Millet. The drills were three feet apart, the seed sown thickly in the drill to be thinned out to three feet apart. Adjoining was another plot of the same area planted to Blunt's corn—one kernel three feet apart either way. Running lengthwise of the field were, first, two and a half rows of the new potato Saranac (Bliss)—potatoes cut to single eyes and two pieces in a hill—the hills two feet apart. Next were Late Snowflakes (Bliss) planted in the same way. Next were a row and a half of Warden Orange Globe Mangel-Wurzel (Thorburn). Next, a single row of Peabody Sweet Potato plants—130 in number. These were planted on a ridge about nine inches high, and nearly two feet apart. A line, in this case as in every other, was extended lengthwise of the entire field, and by it the holes were made in which to plant them. These holes were filled with water by one man, while another set the plants. All were afterwards covered with dry soil for the purpose of retaining the moisture. Planted in this way, sweet potato plants will not wilt in the least, and their roots will at once establish themselves in the moist soil. Next came three rows of True Jersey Navet Turnips (Thorburn); next, three rows of Yellow Malta Turnips; next, the same number of rows each of Green Barrel, Red-top and New Yellow Finland Turnips all sowed in drills three feet apart; next, one row of Extra Early Forcing Carrots—then one of Fern-leaved Parsley; White Hospital Radish; New Thick-leaved Dandelion; another of Extra Early Forcing Carrot; then one of New Extra-long White Spine Cucumber. The last were planted six feet from the Carrots and six feet from the next and last row, which was one of Premium Flat Dutch Cabbage plants. In order to judge by comparison of the more desirable methods, a part of the plants were deprived of their leaves—a part not.

The Apiarian.

ANOTHER GOOD BEE-HIVE.

The accompanying cuts represent a hive that is perhaps simpler in its construction than the one figured and described in the RURAL of May 31, though otherwise no better. It is a two-story Langstroth hive, adapted to the size of the Gallup frame. Figure 1 shows the lower story with the partially filled brood-nest, and Fig. 2 the upper story, which contains the sections for surplus honey. Each story of the hive is eighteen inches long by twelve inches wide by twelve inches high, inside measures. The cover, *a*, is hinged to the upper story and represented as turned back. To make the hive substantial and lasting, it should be made of good inch lumber, free from knots and other defects. A shoulder, on which to hang the frames, must be formed on the inside upper edge of the side-boards of each story. This can easily be done by the buzz-saw (which, by the way, is an almost indispensable machine for bee-keepers who are their own mechanics), by cutting out a strip half the thickness of the board by five-eighths of an inch deep. To prevent the bees from gluing the frames fast, a strip of tin should be tacked on the inside, so that the edge projects a little above the shoulder, thus presenting a sharp edge on which the frames can rest, leaving the bees no chance to glue them fast. This construction is the same for all hives with hanging frames, no matter what their other dimensions may be. To prevent the rain from oozing in, and that the hive may be tight in every respect, the outside upper edges of each story are beveled and a narrow shoulder made on which the story above can rest, this having a corresponding beveling in the bottom.

The bottom board, *d*, is not fastened to the hive, and the entrance is a groove in the bottom board made in the form of an acute angle, so that by drawing the hive back, the entrance can be contracted at pleasure. The slighting board is marked *e*; it can be either loose or be joined to the bottom board, as desired. On the whole, it is a convenient hive that is used somewhat extensively by successful bee-keepers throughout the country.

The above cuts, together with those that appeared under the Apiarian in the RURAL of June 7th and 14th, are from Cook's Manual of the Apiary, Professor Cook having kindly permitted us to use them.

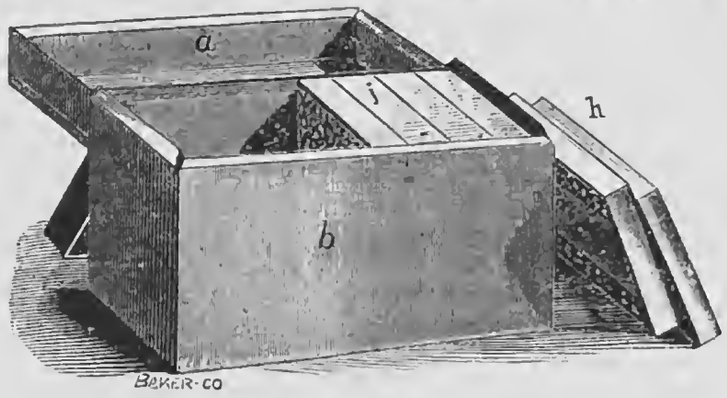


FIG. 2. UPPER STORY.

HOW TO MAKE NUCLEI AND ARTIFICIAL SWARMS.

Mr. G. M. Doolittle, the well-known successful bee-keeper of Borodino, N. Y., writes us the following as being the best method of forming a nucleus and making artificial swarms. "To best form a nucleus, go to a populous colony and select a frame of brood that has plenty of young bees coming out of the cells, and take it, with adhering bees (don't get the queen), to an empty hive and place it therein. If this frame does not have plenty of honey, get a frame of honey with adhering bees and place this next to it. Contract the hive by means of a division board to the wants of the one or two combs, and confine the bees to the hive for forty-eight hours, when the hive entrance should be opened near sundown. The next morning, after the bees are released, a queen cell, reared in a populous colony and which is nearly ready to hatch, should be given them.

The best plan for making artificial swarms, as considered by some of our best bee-keepers, and one which is especially adapted to securing large yields of honey, is as follows: About twelve days before your main honey harvest go to a hive, which I will call No. 1, and shake all the bees and the queen from their combs into a new hive, filled with empty frames and provided with starters of foundation, or, still better, if you have them, empty combs. Place the new hive where No. 1 stood, and put the boxes from No. 1 on the colony thus made. Thus you have a very strong swarm, containing all the bees and queen from a populous colony and the partly filled boxes from No. 1, the bees being ready to take advantage of the honey harvest when it comes. Now take the combs of brood taken from No. 1 and set them on No. 2 stand, having previously removed No. 2 to a new stand a rod or two away. Go to your nucleus (all apiarists should have nuclei with laying queens on hand at this season of the year) and get the comb the queen is on, and take it, bees and all, and shake them off in front of the hive formed of the combs from No. 1, and let them run in; next put on boxes, and the work is done. Swarms should not be made at any time when the bees are not flying briskly, as we depend upon the bees returning from the the fields to make up the swarm. Thus you have two colonies, one composed of a full hive of combs and brood, a good young queen, and workers to protect her, and all the working force from No. 2, making a big, strong stock, which will produce a large quantity of honey. The other, No. 2, has a hive of combs and brood, their old queen, and boxes partly filled, but have lost their working force. In from eight to twelve days they are stocked up with workers again, and are also in fine shape for the harvest."

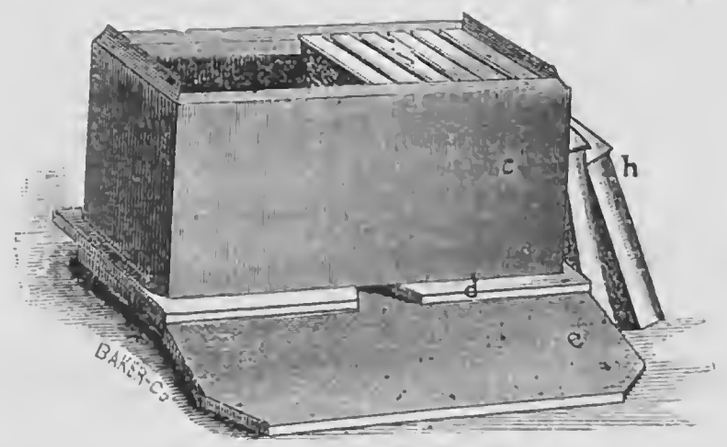

FIG. 1. LOWER STORY.

The Poultry Yard.

HOW MANY EGGS CAN A HEN LAY?

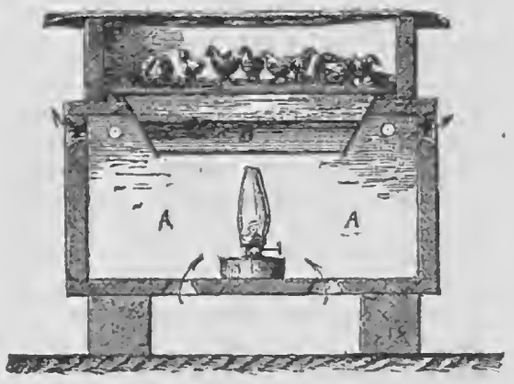
AN estimate upon the subject by Geyelin, and indorsed by Prof. Miles, was published in the RURAL of January 11th, 1878, which if correct, would tend to discourage poultry-keeping. I have a few facts and figures that may be of some service to readers of the RURAL. On the 1st of November last, my flock of poultry consisted of 47 pullets, hatched from the middle of May to the first of July of last year, and 18 hens hatched the previous year, besides cocks. The total number of eggs laid from November 1st, 1878, to May 31st, 1879—seven months—was 4452. Now, Geyelin says that hens, the second year, will lay from 100 to 120 eggs each. Allowing his highest estimate to be correct, my two-year-olds should have laid 1260 eggs in the seven months, leaving 3192 eggs to be credited to the one-year-olds; or nearly 68 eggs each. Supposing that the 18 old ones had laid, in seven months, the highest number Geyelin allows in a year, it would still leave nearly 50 each for the others, or about twice and one-half more than his highest estimate. By this *excess* is where the profit comes in. Six of the hens died in the winter, which lessened the number of eggs; but such accidents must be expected, so in my figuring I consider them as all living.

My hens have also hatched out 170 chickens, while eight more hens are nearly ready to come off. My hens are a mixture of Brahmas, Houdans, Buff Cochins and White Leghorns, etc., the latter largely predominating. The cost of feed—which has all been purchased—in the seven months, has been $37 78. At Geyelin's estimate, it would have been a losing business, but as the facts are, there is a fair, though not a large margin of profit, besides a considerable amount of first-class manure, which, in my opinion, is of consequence.

NELSON RITTER.

A HOME-MADE ARTIFICIAL MOTHER.

NOTICING several inquiries of late in this paper for artificial mothers and incubators, I send the present design of a home-made one, which can be constructed at very slight expense. The entire design is shown in section (except the chicks) in the sketch below. It consists of the wooden box A—a good soap or candle box will answer the purpose well—in the top of which a round hole is made of just the right size to set therein a common milk pan B, partly filled with water. Over the pan put a sheet of tin or iron; or a piece of old zinc can sometimes be found, which has served its mission under the kitchen stove and can



now be utilized for this purpose. On this place several thicknesses of cotton or wool, on which place the chicks. Around this, on top of the first box, place another shallow one without top or bottom, to confine the little fledglings. Over this throw a blanket etc. In the lower box and under the pan of water, place a small kerosene lamp which should be so regulated as only to warm the water to a comfortable temperature for the little innocents above. When the water is once warm, the smallest nursery lamp will suffice. Holes should be made in the top and the bottom of the box to supply air.

This arrangement, if properly attended to, will make a very good incubator. A few holes punched in the metal plate over the pan, would supply moisture—a great desideratum. A thermometer placed in the incubating chamber should be kept at from 105 to 109 degrees Fah.

Ontario Co., N. Y. WM. ROBT. BROOKS.

THE BEST FOWL FOR THE BOSTON MARKET.

THE perusal of Mr. E. P. Powell's article entitled "The Best Fowls," and published in the RURAL of May 31, leads me to send a few words on the same topic from this quarter.

In settling the question as to which breed is the best, he enumerates certain points which should be taken into consideration, the first of which is, "Eggs, their weight and number." As filling this condition, he mentions as among the best, the White Leghorn, Plymouth Rock, Brahma and Houdan, in this order. Now I maintain that the Light Brahma is ahead of both the Plymouth Rock and Leghorn in the size and number of eggs, laying, as she does, nearly throughout the whole year.

His third point is, "Quality of fowls for table use," and in this connection he gives the first place to the Plymouth Rock, placing the Brahma second. The Light Brahma, however, is certainly the best fowl for the Boston market. To obtain the best price there, the bird must be yellow-legged, white-feathered and fat—white, because the pin feathers necessarily left in dressing are less conspicuous. The young roosters should *not* be inclined to couple with the hens at an early age—a great fault with the Leghorns and Plymouth Rocks, and one that seriously injures their market qualities. Boston market has, I think, a weakness for fat meats; I certainly never saw any poultry meat there so fat as to injure its sale, and I have dressed a great many fowls for that market. That the chicks should be yellow-legged, good-sized, fat and smooth, are the only recommendations they need for the Boston market. There are a few English residents who would pay the highest price for five-toed, or Dorking chicks, but the demand for them is

so small that dealers prefer the Brahmas by long odds.

Mr. Powell's sixth point is: "Their shape and color, or their beauty," and he says that he would class the Dominiques, Plymouth Rocks, Black Spanish and Leghorns as especially handsome. Now my idea is that all beauty is in the eye of the beholder, and what more beautiful sight in the poultry line than a flock of well-bred, well-fed Brahmas ranging in the pasture or feeding upon the lawn! They always remind me of the South-Downs among sheep and the Short-horns among cattle. The rule by which I should judge of beauty on the farm is the old adage, "Handsome is that handsome does," and certainly no fowl has done better with me than the Light Brahma. Birds of this breed, as bred in this neighborhood, have no more waste in the way of necks, wings and feathers than have the Plymouth Rocks. They do not scratch as much as any of the other sorts, but range off in the fields like turkeys. As mothers they are excellent, their large, well-feathered bodies affording to the young chicks plenty of much-needed warmth in winter and early spring—the most profitable seasons for hatching them for market in this part of the world. T. G. LINCOLN.

Bristol Co., Mass.

The Querist.

ANSWERS TO CORRESPONDENTS.

"Bugs" and Beetles.

H. F. B., Kalamazoo, Mich., asks how insects are classified, what the difference is between a bug and a beetle, and if our striped visitor from Colorado, the potato "bug," is really a "bug" as it is popularly called.

ANS.—The order *Insects*, which comprises all those little animals having six legs, the body divided into three distinct regions, and which are generally provided with wings, is divided into seven suborders and all insects are classed under these according to their several characteristics, the more highly organized being placed first and the others following in regular order terminating with the Neuroptera, which are the most degraded among insects. Thus wasps and bees, the highest of insects, belong to the suborder Hymenoptera. Then come Lepidoptera including butterflies and moths. Next come Diptera, insects having but a single pair of wings, including the flies. Then follow Coleoptera, (beetles), Hemiptera (bugs and lice), Orthoptera, (crikets and grasshoppers) and Neuroptera of which the dragon-flies are the most common. It will be seen that beetles and bugs belong to different suborders, and that beetles stand the higher of the two. The beetles are easily recognized by the two horny shells or forewings (elytra) which cover the hind wings, and also by having the first segment of the thorax or breast, called the prothoracic ring, greatly enlarged. The gentleman from Colorado, has these characteristics and is therefore a beetle and not a bug. The Hemiptera or true "bugs" have the mouth-parts modified into a sucking tube, the body is generally flattened and is more angular than that of the beetle, and only the first or basal halves of the forewings are horny, while many of them are entirely wingless. These characteristics will be seen in the squash-bug.

Raising Cream in a Spring Milk-room.

W. E. M., Wallsville, Pa., asks the very best method of raising cream in a milk-room through which there flows, from a large cold spring, a stream capable of being made as deep as desired. If deep setting is recommended, he inquires whether the milk should be set in the water, when first strained; and how long should it stand before being skimmed.

ANS.—With such facilities for water, deep setting would be very desirable, as it greatly diminishes labor and facilitates the rising of cream. Deep setting implies *cold* setting, since if deep, the milk must be cold to prevent changing. Cold setting raises cream soonest and most perfectly, and makes a butter which pleases the average taste, and which keeps reasonably well. Hence, we would set in water when fresh, and cover and submerge after the milk has come to the temperature of the air. Twelve to twenty-four hours, according to the temperature of the water, will be long enough to stand before skimming. When milk is set shallow at about 60° in a dry and pure atmosphere, the cream undergoes a ripening process by which new flavors are developed that give the butter an exquisiteness that can not be reached in deep setting, which must be too cold for the ripening process to go on. It is so seldom that the pure, dry atmosphere of the right temperature can be found, that cold setting is generally advised.

Cyclamen and Geranium Culture.

Mrs. J. B., Owasco, N. Y., wants to know how to grow the Cyclamen; she has raised some from seed, but they do not seem to do well. She has set her "Lady Washington Geranium" in the ground, and has no luck in raising slips from it; she would like to know what is the matter.

ANS.—Cyclamens are easily managed. Give the young plants a mixture of fibrous loam, leaf-mold and well decomposed manure in equal parts, with the addition of some sharp sand. Keep the plants in small pots at first, and repot as often as they are filled with roots. During summer, the pots should be sunk in the ground out-of-doors, and watered carefully till the leaves begin to fade, when they should be allowed to rest. In the fall, repot the plants, remove them to the greenhouse or plant room, and water sparsely till they begin to grow; then put them in a warm, sunny place, and water more freely. Cyclamens are among our most valued plants for winter blooming. The "Lady Washington Geranium"—by which we suppose is meant one of the large-flowering Pelargoniums—should be pruned closely after flowering, the pot put on the side in a shaded place, and receive no water for a few weeks. in the beginning of September it should be repotted in fresh sandy soil, and again started to grow. Cuttings can be made in the spring. A flat box, on the bottom of which are a couple of inches of leaf-mold, and this covered with an inch and a half of white, sharp sand, will make a convenient bed for cuttings.

Shrinkage of Packed Butter, etc.

S. S. R., Athens, Tenn., asks, 1, whether packed butter shrinks by holding it some months, and when does the shrinkage begin. 2. Two cows are own sisters; both were served by the same bull, and he inquires what relations are the calves.

ANS.—1, Butter often shrinks by holding from the evaporation of water in its composition, if water is retained in washing. Salt often causes a considerable separation of water from butter, causing it to shrink away from the sides of the package which contains it, occasioning an accumulation of brine. This often occurs when butter has an unusual amount of water in its composition, and is highly salted. Butter also shrinks when exposed to the air, by reason of the oxydation of the carbon in its soft parts occasioning an escape of carbonic acid gas, and the vapor of water which results from the splitting of the fats by the attack of oxygen upon their carbon. The shrinkage is too variable to admit of any rule for estimating it. 2. Half-brothers or sisters, according to their sex. We have no term to express the difference in consanguinity between the offspring of the same male by females related, and females not related by blood.

Canker in Fowls.

W. J. Z., Washington Co., Pa., says: "Our chickens are afflicted with a disease known hereabouts as 'sore head.' It appears to commence in the mouth; the tongue and roof of the mouth, and finally the head become covered with yellow scabs, and the birds get entirely blind. What is the name and what the remedy?"

ANS.—The disease is usually called "Canker." It sometimes affects only the mouth and throat, but more frequently, as in this case, extends to the eyes and head. With a piece of hard wood, about the size of a lead pencil, the end of which should be made spoon-shape, remove all the "scabs" you can, on their first appearance; wash the head, mouth and throat with a solution of chlorate of potash, or vinegar and water, equal parts. Then powder the sore places with flour of sulphur. Repeat daily or oftener. Give soft feed; if the fowl refuses to eat, make the food into pellets, one or two inches long and half an inch in diameter, and put them down the bird's throat.

Destroying Squash-Bugs and Cut-Worms.

D. H., New Milford, Pa., has trouble with the squash-bugs; they and the cut-worms are destroying his squash vines, and he wishes to know how to get rid of them.

ANS.—We know of no better remedy for the squash-bugs than to catch and destroy them, as we have often recommended in answer to similar questions. Paris-green has been recommended by some, and we doubt not it would prove efficient, but it is by far too dangerous a remedy to apply to plants of which the fruit or anything above ground is eaten, and we cannot sanction its use for this purpose. The bugs have the habit of concealing themselves under small objects lying about the plants; hence, placing small boards, chips, pieces of bark, etc., around the plants may induce them to crawl under these, where they, on examination early in the morning, may be caught. The cut-worms should be dug for and picked out by hand. They will also conceal themselves in small bunches of fresh grass placed about the plants.

Seeds that Won't Germinate

M. F. J., Uniontown, Pa., asks why certain flower seeds from the RURAL refuse to germinate. Some were planted early and some late, but both lots are alike obstinately determined not to send a shoot above ground.

ANS.—We have never raised Callicarpa from seed. Yuccas germinate freely. We cannot even guess why yours have failed. Is your soil mellow, drainage good? Have you kept it moist? Are you sure it has not been permitted to dry out? Perhaps you have watered it too much. We have not the least trouble with them, and have now many plants five inches high from the same seed. No, the Hibiscus will not bloom until the second year.

Rust-proof Wheat.

S. A. M., Scooba, Miss., asks whether there is any kind of rust-proof wheat,

ANS.—We do not know of any. If such a variety were discovered or produced, it would be highly popular and a blessing to agriculture.

Miscellaneous.

M. F. McC., Darlington, Pa., sends us numbered specimens of plants for name.

ANS.—No. 1. Gillenia trifoliata, of the Rose family. No. 2. Tradescantia Virginica, common Spiderwort. No. 3. Œnothera fruticosa, Evening Primrose family. No. 4. Valeriana officinalis, Valerian family. No. 5. Please send us a better specimen. No. 6. An Artemesia—must have flower. No. 7. Spiræa opulifolia (now removed to Neillia), Ninebark.

C. H. H., Norwich, (there are seven of them in the country) asks where can Magnolia trees be purchased, and whether they will live in the open air in his latitude.

ANS.—They may be purchased of any nursery. Spring is the best time for transplanting—indeed the only time when they can be transplanted with success. If our friend will advise us of the State in which he lives, we will be glad to name species which are suited to the climate.

W. N., Hancock. Wis., asks the relative prices of Lop-eared, Himalayan and Angora rabbits.

ANS.—The Lops are the most valuable good specimens being worth from $5 to $10 per pair, and extra fine animals suitable for exhibition bringing as high $20 to $25. Himalayans and Angoras are more easily bred and much lower in price; fine specimens being sold at $5 per pair.

D. H. H., Caldwell, Texas, says that in his section the leaves of corn alone are called fodder, and he asks whether in returning account of Blunt's corn, the whole stalk, except the ear, is to be included in that term, or the leaves merely.

ANS.—The leaves and stalks, less the ears.

U. S. T., Ontario, Canada, has planted his premium-corn on ground surrounded by Pearl Millet, to prevent it from mixing with yellow corn, and he asks whether he has infringed the rules of fair-play.

ANS.—We should say, "No."

S. F. B., Buckeye Center, Ill., asks where can a work on archery be bought.

ANS.—Messrs Scribner & Co., of this city publish an excellent work, treating of every part of the subject—price $1.50.

J. P., Guilford Conn., asks how to destroy rose-bugs.

ANS.—We have never known so many rose-bugs as during the present season. We really do not know what to advise.

J. T. M., Lysander, N. Y., sends us a grass, asking for its name and if it has any value for pasturage.

ANS.—The grass is Millet Grass (Milium effusum). It has no value as a forage plant.

Miscellaneous.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 30.—JUNE 20, 1879.

Fertilizer Analyses.

279. Lister Brothers' Ground Bone. Sampled by Experiment Station, May 26th, from stock of R. B. Bradley & Co.

288. Ground Bone. Royal Jennings, agt., Trumbull, Ct. Sampled and sent May 30th, by Fr. G. Heublein & G. Goessinger.

	279	288
Nitrogen	2.80	3.85
Phos. Acid	10.63	19.46
Estimated value per ton	$23.10	$37.57
Cost per ton	30.00	32.00

280. Stockbridge Grass Top-dressing. Sampled by Experiment Station, May 26th, from stock of R. B. Bradley & Co.

281. Forrester's Cabbage Fertilizers.

282. Forrester's Potato Fertilizer.

284. Forrester's Strawberry Fertilizers. Samples 281, 282 and 284 were received May 28th, from M. S. Baldwin, Secretary Farmer's Club, Naugatuck, Ct.

	280	281	282	284
Nitrogen as Am'nia	3.14	5.99	3.90	2.41
Nitrogen as nitrates	2.79			
Nitrogen, organic	1.17	.28	.73	.60
Sol. Phos. Acid	3.79	3.85	.37	8.22
Rev. Phos. Acid	.30	2.21	5.09	2-12
Insol. Phos. Acid	.36	.45	1.63	.85
Potash	7.52	7.44	9.06	5.91
Chlorine	7.51	2.03	2.66	2.10
Est. val. per ton	$46.10	$51.21	$43.67	$46.66
Cost per ton	50.00	40.00	47.50	42.50

Cost per ton of 288 is reckoned from price per hundred weight, viz., $1.60.

Cost per ton of 280 is reckoned from price per bag of 200 lbs., viz. $5.00.

Sample 279 contains 21.6 per cent. of matters soluble in cold water, mostly "salt cake" (?).

The potash of 280 exists as muriate and is reckoned at 4½ cents per pound.

The potash of 281, 282 and 284 is reckoned at six cents per pound.

S. W. JOHNSON, Director.

WHAT OTHERS SAY.

PRICKLEY COMFREY.—In 1878 a correspondent of the London Gazette planted some of the above plants in a corner by his piggeries. It was a piece of land under trees, and would grow nothing but weeds. He planted in March and it was ready for first cutting in June, and was cut four times last summer, principally for the pigs, a cow preparing for Christmas, and calves. Although the above stock live on the best of grain and cake they eat the comfrey once a day greedily. He has now in a pigstye fourteen caged lambs that suckle a small cow, get cake and grain and prickly comfrey twice a day since the beginning of April, and are doing very well. He considers it a most valuable plant; it seems to take hold of the ground so that neither wet nor drought affects its growth, and it will produce green food for eight months in the year. He thinks it is quite a treat to see the little lambs enjoying their comfrey and also considers it ornamental, and believes no other plant will grow the same amount of produce.

PRIMARY CAUSE OF YELLOWS.—Our friend Mr. E. J. Williams, tells the N. Y. Tribune, that every season quantities of peaches of all questionable sorts are sent to the New York market from the south. If in very bad order they are overhauled, the rotten and unsalable are thrown out, divested of their flesh, the pits washed clean, dried and stored away; in some cases the pits are the only part of the shipment from which anything is realized. At the close of the season these pits are barreled up and exposed for sale labeled "Prime Southern Peach Pits," and find their way to all parts of the country.

Here he contends is to be found the primary cause of yellows and premature decay of peach orchards, so disastrous and discouraging to planters in all sections, for, like consumption in the human family, which is often hereditary, it does not develop itself till arriving at maturity, and an impoverishment of the soil is favorable to this development.

ROADSIDES CULTIVATED.—Mr. Gennert, writing to the American Cultivator from California, says that while he was riding with a farmer to examine the beet fields, he was involuntarily reminded of the intervale land around Fryeburg, Maine, foul with weeds wherever you turn, though richer than any land he had seen yet. He found every patch of land utilized. On the public roads alongside the fences, that part which is not actually cut up by the wheels is, with rare exceptions, sown in grain; although even sugar beets are planted there in some spots. He asked his friend, with whom he was riding, if that paid. He replied, "Well, it just about pays for the labor; but if these strips were grown thick with weeds, which would be the case if not cultivated, it would give us a great deal more work to keep the fields clean."

THE FARMERS' LAWN.—Mr. Hyde says, in the Massachusetts Ploughman, that no one begrudges the chickens a yard in which to run, flirt and frolic, and are not children entitled to equal privileges with the chickens? Whatever makes home attractive, if it is no more expensive than a lawn, is not wasteful. If we wish to keep our boys on the farm, and to train our daughters for farmers' wives, we must make the home pleasant and farm life something besides mere drudgery. We know nothing that adds such a charm to a country home as a lawn; and when, after the labors of the day are over, the boys and girls assemble upon it to play croquet, and the grace of motion and the exhilaration of social life are added to this thing of beauty, the scene is delightful, and if anything will make the farm attractive, this will.

CURIOSITIES IN POMOLOGY.—The Hartford Post says: "some years ago one of our citizens bought and set out some thrifty young apple trees. From one of them he neg-

lected to remove the wooden label which was attached to one of the limbs by a copper wire. Two years later he found that the copper wire was imbedded and out of sight in the bark of the tree, and that year the limb was so heavily loaded with apples that he was obliged to prop it up, while there was not a blossom or apple on any other limb. Last year one of his neighbors, when his apple trees were in blossom, carefully girdled some limbs on several trees, and the blossoms produced no fruit on the limbs thus treated, but this year those limbs have blossomed full, and no blossoms are on the limbs that bore last year. Pomologists may profit by further experiments in that direction."

THE FOUR INDISPENSABLES.—To establish beet-sugar works with reasonable certainty that they will pay, four things are indispensable, Mr. Gennert says in the Pacific Rural Press. These are: Beets, money, fuel and water. Of each of these it requires a liberal supply; if either of them is wanting or but scantily supplied, failure certainly will be the result. Besides a liberal supply of these four articles, all of which exist in great abundance in California, it requires men who understand the business and also the English language, and know the country well enough to avail themselves of the great many advantages which the United States offer to the beet-sugar industry.

BAD EXAMPLES.—A correspondent of the Maine Farmer says that we have a class of farmers among us who do not pursue farming as a means of support, but simply as a pastime. These so-called farmers do not feel the effect of an experimental failure as we do who are obliged from necessity to count the cost of every step before we take it. He is sorry to say we are too apt to follow the lead of such farmers.

PURE WATER FOR LIVE STOCK.—The Chicago Times says that the best dairymen aim to have a constant supply of pure, cold water in the pastures where cows feed during the day and in the yards where they rest at night. It seems to us that there is no interest so great that is looked after so heedlessly by the average farmer, as that of pure water for farm stock of every kind.

DEGENERACY OF AGRICULTURAL FAIRS.—"And so," says the New England Farmer, "the 'farmers' fairs' have, in too many instances, been given over into the hands of those who have very little interest in the welfare of the farming community."

MICHIGAN has been sending large quantities of strawberries to Ohio, and the finest fruit offered there this season. So says Colman's Rural World.

TRUE—And those who pause to rescue a man or woman on the downward road, are the exceptions and not the rule.—The Western Rural.

BOOKS RECEIVED.

TWELFTH ANNUAL REPORT of the Secretary of the Connecticut Board of Agriculture, 1878-9. T. S. Gold, Secretary, West Cornwall, Conn. This Report, of 408 pages, is both interesting and highly instructive. It contains much less dry records than are usually found in such works; but more instructive matter. Among the valuable articles it contains may be mentioned a lecture by Prof. W. H. Brewer, on Varieties of Cultivated Plants, occupying twenty pages, and full of valuable information; another, by Prof. D. C. Eaton, on Hybrids and Hybridism, in which, in thirty pages, is epitomized the latest and best information on the subjects treated of; Farming as a Business, by J. M. Hubbard, in sixty-two pages, gives many practical points to practical farmers; while our friend J. J. H. Gregory, in an address of thirty-two pages, tells all about the Culture of Vegetable Seeds. An interesting extract from this address appeared in the RURAL a couple of months ago. Seed-breeding, by Dr. E. Lewis Sturtevant, is probably as valuable a contribution as can be found in the work, and will well repay a perusal of the forty-six pages in which the Doctor expounds the results of his investigations. History of Animal Concretions; Vitality of Seeds; Propagation of Nursery Stock; Report on Diseases of Domestic Animals; Report on Farms, together with a very useful list of Analyses of Fertilizers, etc., etc., make this a work which should be sought and carefully studied by every Connecticut farmer. The Analyses of Fertilizers are by Prof. S. W. Johnson, Director of the Connecticut Experiment Station at New Haven, and are of the same nature as those published nearly every week in this paper. Appended to the Report of the Board of Agriculture is a Report of the Experiment Station, of 128 pages, containing a summary of the work done thereat during the year, and affording an excellent illustration of the value of such institutions to agricultural science and practice.

QUINBY'S NEW BEE-KEEPING; a complete guide to sucessful bee culture, by L. C. Root, is the title of the latest work on bee-keeping, published by the Orange Judd Company, 245 Broadway, N. Y. Price $1.50. Mr. Quinby, the late well-known apiarian, published a book on bee-keeping in 1866, of which the volume before us is a revised and enlarged edition. Many important discoveries and inventions having been made in the art since the first publication, the author contemplated the revision of his work; but, dying before his design was carried ont, this duty fell to his son-in-law and business associate, Mr. L. C. Root, who has ably completed the task. The book gives a lucid and popular explanation of bee-keeping, and is well worthy of a perusal by all who are interested in the subject. It contains 270 pages, is printed in clear type on tinted paper, and is handsomely bound in cloth.

CATALOGUES, &c., RECEIVED.

MR. J. F. Mancha, formerly of Delaware, has, we learn by the pamphlet under notice, moved to Claremont, Virginia, where he has, with others, formed a colony. Surry County, where the tract of 12,000 acres is located, is an engaging spot. Commercial facilities are unusually good, and the situation is adapted to raising the crops that find profitable markets in New York and other northern cities. The terms, we believe, are extremely reasonable, but any one in a migrating mood, will receive gratuitous information in the little pamphlet sent us.

INDIANA AGRICULTURAL REPORT for 1878. Alex. Heron Sec. Indianapolis, Ind. This is a neatly gotten-up work of 432 pages. The index promises well for the contents; but we have not yet had time to examine it sufficiently to do more here than to acknowledge its receipt.

DESCRIPTIVE CATALOGUE of Southern and acclimated Fruit and Ornamental Trees, Grapevines, etc., cultivated and for sale at the Pomona Hill Nurseries, Greensboro, N. C., J. Van Lindley, proprietor. Early peaches for market orders, a specialty.

AMERICAN ASSOCIATION of Nurserymen, Florists and Seedsmen. Our next issue will contain three columns of condensed original reports.

Dairy Husbandry.

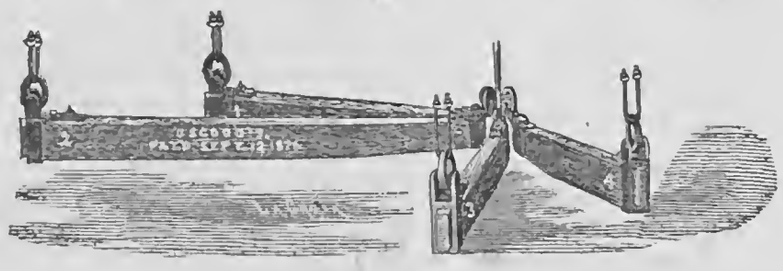
CREAM RISING.

T. H. HOSKINS, M. D.

In my reply to the criticisms of Mr. O. S. Bliss (RURAL, p. 329), a typographical error, at bottom of second column, makes me say that the butter globules are, by the force of gravitation acting upon them through the milk, "extended" upwards; whereas I wrote that they were "*extruded* upwards, as we extrude the seeds from a grape by pressing it between the thumb and finger." I offer this correction as making the sense more clear, but not in the hope that Mr. Bliss will thereby be made to understand my illustrations any better. What I write upon this subject is for the consideration of fair-minded if not impartial readers, and therefore I trust that Mr. Hardin will see that I answered in that article some, at least, of the points in my previous communication to which he seemed to except. My suggested experiment of the beads in the sand was not intended to be parallel in all its conditions to the case of butter globules rising in milk, but only to demonstrate the single fact that the globules might be brought to the surface without anything that could be called a circulatory current; that the only movements really called for by the conditions, are the closing together of the milk beneath the globule and the moving aside from its path of the milk above, as it makes its way upward in consequence of the prevailing pressure of the heavier milk upon the lower semi-circumference of the globule. This will be self-evident to any one competent to discuss the question at all.

No. 3.

A correspondent, addressing me directly, says that while "I should expect the milk used by you in your experiments" (grade Jersey milk) "would conduct itself exactly in the manner reported as regards the rising of the cream, yet I doubt if the same results would be found to follow similar trials with the milk of Ayrshire, Short-horn, or common cows." This is fair and courteous criticism, and to meet it I have arranged to place my apparatus in the hands of one of our most intelligent dairymen, who has a large herd of cows, most of which have no Jersey blood. He will test their milk carefully, and report for the benefit of RURAL readers. With that report I will furnish a sketch of the apparatus, and a description of my method of experimentation. Readers of the RURAL will then have all the facts in the case before them, and, if so inclined, may repeat and verify them for themselves. I study and write upon these subjects solely for the advancement of my own and others' knowledge; and though I have no objections to the criticisms of parties like Mr. Hardin and Mr. Bliss, I address myself chiefly to the intelligent and practical dairymen who read the RURAL.



No. 4.

Field Crops.

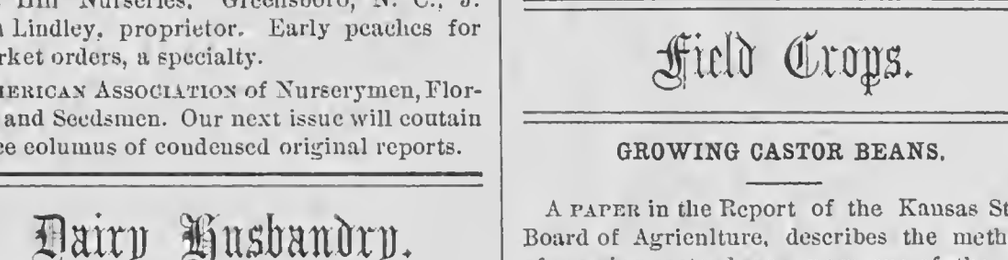
GROWING CASTOR BEANS.

A PAPER in the Report of the Kansas State Board of Agrienlture, describes the methods of growing castor beans, now one of the staples of that productive State. Some of the peculiarities of the process will interest many who have only been accustomed to see how

"Oats, beans, peas, and barley grow."

The smaller bean—the sort grown as a crop—attains to a hight of eight or 10 feet in upland, and has purple stalks, bluish green leaves and green spikes. The ornamental kind, of rich purple and scarlet, grows like a tree, and children climb in the branches six or eight feet from the ground. The field beans are planted four feet apart and thinned to one in a hill. The wagon into which the ripe spikes are thrown, goes along every seventh row bending but not breaking it, if it always goes in the same direction. Sometimes this row is planted with a low crop, as white beans.

The racemes are gathered as soon as part of the pods open and discharge their seeds, as they do under the influence of the sun. A great many are scattered and lost in this way, although five or six successive gatherings are carefully made. The gathered racemes are spread on floors where, in five or six days, they open, and the seeds are popped or expelled to the distance of some feet. Large floors are necessary as the racemes must be laid only one deep. Often the floor is made by putting old hay or straw on a square of old prairie sod burning it thoroughly, and then sweeping off the surface. The grasshoppers won't touch these plants, the chinch-bug avoids them, heavy rains don't hurt them, and they endure drought well. The beans sicken children who are tempted to eat of them, and care is taken not to have any mixed with the feed given to horses. The average yield is 15 to 20 bushels, and they sell at about a dollar a bushel. Formerly, the bean was largely imported from India. The demand for the oil increases, especially for lubricating purposes. Two quarts of seed will plant an acre. G. W.



No. 5.

Industrial Implements.

OSGOOD'S PATENT SCALES.

THE application of steel bearing stirrups and sockets, adjusted for attachment to wooden beams for scale levers, so materially reduces the cost of large scales as to bring them within the reach of farmers, and prove to them a profitable investment. The low price at which they are sold may make it of interest to farmers to know something about their construction.

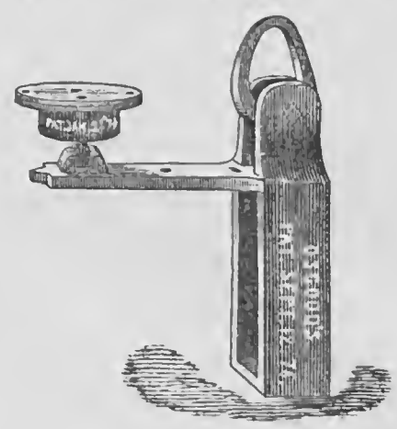
No. 1.

Cuts Nos. 1 and 2 show the stirrups, which are fitted with steel pivots for attaching to wood beams, in order to sustain and accurately transmit weights to the scale-bar.

No. 2.

Cut No. 3 shows a lever with the irons fitted to it. A tenon is made on each end of the lever to fit into the stirrups; and the measure which fixes the distance between these irons is represented on the top of the lever, extending between the irons.

Four levers thus fitted are shown in Cut No. 4, and these are then attached to the wood frame and brass weigh-bar, as seen in Cut No. 5.



No. 6.

Cut No. 6 shows one of the stirrups with the rubber-packed self-adjusting sockets on the fulcrum pivot. There are four of these steel sockets attached to beams upon which the load rests.

When the parts are put together, as seen in Cut 5, each lever is adjusted and sealed with 1,000 pounds of U. S. S. Weights, so that it will weigh accurately on any part of the platform. The irons are then marked, detached from the wood, and boxed with the measuring rods, so that the parts can be attached to any wood anywhere, and weigh any load as perfectly as if the levers were all iron.

The difference between this and all other wood lever scales is, that the stirrups and sockets are constructed in a new and ingenious manner, which admits of their being sealed at the shop and reset anywhere with the same trustworthiness as iron lever scales.

The wood levers when suspended and covered by the platform, can not warp or twist to impair their accuracy, and we cannot see any more objection to the use of wood levers with these iron fittings, than to iron levers with a wood frame and platform to which the irons are attached. We should suppose the wood levers would last longer than any other part of the scale, as they are in contact with nothing but iron.

The direct action of each lever with the scale-bar is so plain and simple, that if the pivots are properly fitted so that the scale will weigh correctly when set, it must continue to do so until the bearings are worn out; this, of course, depends upon how hard the scale is used. For farm uses one of these scales with rubber-packed bearings, will last twenty years by renewing the frame and platform; and the entire cost of timber and scale will not often exceed $40. The directions for building are plain and simple, and the scales can be set in complete order in two days. They are manufactured solely by Osgood & Co., at Binghamton, N. Y., who send them on trial, desiring to have them subjected to the most severe tests before payment is made.

Everywhere.

RURAL SPECIAL REPORTS.

MAINE, Dixmont Center, Penobscot Co., June 23.—The wheat crop in this section bids fair to be a full average one. Corn is very small and backward. This has been a poor spring for corn—cold rain, with frosts on the 8th and 9th, which did some damage to beans and tender plants. About the usual amount of potatoes was planted. The bugs are quite plentiful on some farms, and may damage the crop. The hay crop is quite good—especially on new ground. The fruit crop will not be very good, Last season we had an unusually full crop, which is one cause why trees did not bloom fuller this season. S. B.

NEW HAMPSHIRE, Dunbarton, Merrimack Co., June 23d.—Wheat and potatoes in this section are looking well. The Beauty of Hebron which the RURAL sent me, is in blossom. Corn is not looking as well as usual, on account of so much cold weather. There will probably not be more than half a crop of apples. G. O. W.

MASS., Greenfield, Franklin Co., June 22.—Corn looks badly. Potatoes are poor, but the "bugs" are abundant. Oats look well. Not much wheat is raised here. The hay crop is good; I have one field of orchard-grass that will average five feet. Apples will be an average crop. Quinces set well; so did pear trees, but they blighted afterwards. Cows are plentiful here, and are selling for from $35 to $45. Butter is low—18c.; eggs, 12c. Peach trees were almost all killed last winter, as was a large Concord grape vine on my house. The weather has been cold, wet and frosty all through May and June. A. H.

NEW YORK, Corning, Steuben Co., June 26.—According to present appearances, the hay crop will not be nearly as good as last year, owing to the drought in May. Spring grain is also injured to some extent from the same cause, as well as winter wheat and rye; but winter wheat, as a general thing, was not sown early enough last year in this section. Many delayed sowing till late, hoping thereby to defeat the Hessian fly, and consequently will defeat their own interests by harvesting a short crop. If wheat cannot be sown early, it had better not be sown. Just now it is a fine growing time, with frequent showers keeping the ground moist and in good condition. The apple crop will be short in some localities, by reason of the frosts, which were quite severe in some places, on the 6th and 7th of this month. There seem to have been many colonies of bees lost in this vicinity the past spring from some disease. Nearly all who keep bees have lost more or less, and in some cases their whole stock, and this while they were well supplied with honey. A great many more potatoes have been planted than in many years before, and they are looking well. The Colorado beetles as yet have been far less troublesome than formerly, and we hope their number will not again be so numerous. Strawberries, also, were much injured by the late frosts; but the prospect is fair for an abundant crop of wild raspberries, as well as of blackberries, huckleberries and blueberries. The corn crop is behind time; but, as a general thing, there is a good stand on the ground, and of excellent color, so that if the season is now favorable, it will be likely to come out all right at the end of the season. I find I planted my Pearl Millet too early, consequently it did not come up as well as I could wish, and now it is not of so good a color as I like. Wool is a good product to turn off this year, and, as butter is low, it will be strange if many do not reduce their number of cows and get more sheep, which will be a poor change to make, I believe, for then probably the price of wool will be low and that of butter high. I am very much pleased with the Willows received from the RURAL Grounds last year. They are making a good growth and the foliage is nice. Wool is selling for 35@37c.; eggs, 12c., and butter, 10@14c. F. H. D.

N. J., Harbourton, Mercer Co., June 23.—The hay and wheat crops are a little below the average. Corn is short, owing to cool nights. Potatoes look well, although there are plenty of "bugs." All kinds of fruit are scarce, except Smith's Cider apples, here and there. E. H. B.

PENN., Darlington, Beaver Co., June 21.—Wheat is about half a crop. Corn is very backward. Potatoes are good. Oats, the same. Fruit is about one-fourth of a crop. Meadows are short. R. J. E.

OHIO, Duncan's Falls, Muskingum Co., June 25.—Wheat is about half a crop; the ears are well filled, but the growth is light on the ground. Corn came up badly; much of it had to be replanted, and it has been injured by wire and cut-worms; very cold weather causes it to be small. "Bugs" and potatoes have a hard fight for the mastery, but Paris-green settles the former. The fruit crop is very light, except small fruits, which are doing pretty well. Grass is not more than one-third of what it was last year. Our dry weather seems to be confined to the vicinity of Zanesville, as good showers have been quite frequent south and east of us in this county. W. A. C.

OHIO, Martinsville, Clinton Co., June 23.—Spring is late. Corn is backward, with a poor stand. Oats are short. Wheat is fine—will be mostly harvested this week. There is not so much straw as last year, but the wheat is evener on the ground and better headed. Small fruits are in abundance, blackberries excepted. No peaches, no plums. Grape-vines were badly winter-killed—will give about a fourth of a crop. No cherries of any consequence. The prospect for apples is very good—plenty of summer apples. We cannot tell about potatoes yet. A larger acreage than usual is planted. H. B.

OHIO, Galion, Crawford Co., June 20.—June so far, has been wet, but the month of May was very dry. The wheat crop looks splendid. Corn is a little backward on account of the cold, dry weather in May; we had to do a good deal of replanting, but I think the warm rains now will bring it out all right. Potatoes look well. The apple crop will be poor this fall, as there are but few trees that have any at all. No peaches. Small fruits are abundant. The hay crop will be a little light. Wheat is selling for $1.06 per bushel; oats, 33c.; hay, $6 a ton; wool, 35c. per pound; butter, 10c. per pound; eggs, 10c. a doz. B. F. R.

OHIO, Atlanta, Pickaway Co., June 22.—This has been the latest season ever known here. Corn not all up yet. Some farmers have planted the fourth time. Wheat is a fair average crop; it will be fit to cut in about a few days. Oats are a short crop. Grass is good. Potatoes are fine and there is a large acreage of them. All the grass sown this spring was lost. Apples will be a good crop; cherries, a light one. Peaches and plums are total failures. A. L.

OHIO, Port Clinton, Ottawa Co., June 20.—Wheat looks fine—corn is backward. Spring grain is coming forward since the rains. Owing to the dry weather in May hay will make ¼ less than a crop. Late rains are making the potato crop a success. Wool is selling freely at 35 and 36 cents. Apples will be a quarter of what we had last year. Peaches are half a crop. Small fruit plentiful. L. M.

OHIO, St. Clairsville, Belmont Co., June 23.—Wheat has been injured considerably by late frosts and drought; but will yield a moderate crop. Corn and potatoes are doing very well. The fruit crop has been greatly injured by a severe winter, most of the smaller varieties having been killed entirely. Oats and hay are badly injured by the cold, dry weather of May and June. S. B.

IND., Pennville, Jay Co., June 23.—We have had wet weather during the last six weeks, but April and the first part of May were very dry. We had an uncommonly cool spring. The prospect for corn is as poor as I ever saw it at this time of the year. It was a difficult matter to find corn that would grow. There is a good crop of wheat—nearly as good as last year's. It will be ready for harvesting about the first of July. Potatoes look well. The potato bugs are not doing much damage. Grass is good. There has been too much rain for flax. Oats look well on high ground. Apples and cherries are plentiful, and there is a good prospect for grapes. No peaches. Gooseberries and currants are abundant where they have not been destroyed by worms. E. T.

IND., Hall's Corners, Allen Co., June 20.—The prospect for wheat in this county was never better, and more than an average acreage was sown last fall. Corn is backward in consequence of poor seed, yet an average crop is expected. Oats look well—not as much sown as last year. Potatoes bid fair for a good crop. Fruit is not as plentiful as last year, except small fruits, which are in great abundance. This is the "off year" for apples in this part of this county. W. H. H.

ILLS., Buckeye Center, Stephenson Co., June 20.—Small fruits in this part of the State are a good crop; other fruit, a medium one. S. F. B.

MICH., Kalamazoo, Kalamazoo Co., June 21.—The prospect for wheat in this county is good. Corn is backward and small. Potatoes promise better than usual. Fruit will be about half a crop. J. T. C.

WIS., Freedom, Outagamie Co., June 20.—The prospect for a full wheat crop, both of winter and spring wheat, is good in this part of the State. The cool, dry weather, though favorable to the growth of wheat, has not been so good for corn. A frost on the night of June 17th, cut much of the corn to the ground. Potatoes and other tender crops were similarly injured. We have not had rain enough to make a good hay crop. We shall have a partial crop of fruit. Small fruits are coming on finely. Oats promise well. The army-worm or caterpillar (?) is doing some damage to fruit and forest trees—this is the second year we have had them with us. There is a slight improvement in prices of most kinds of farm produce compared with the figures at this time last year. Wages of farm hands are low—from $10 to $16 per month and board. All crops now are needing rain badly. E. N.

MINN., Champlin, Hennepin Co., June 23.—We have had an abundance of rain this spring and early summer, so far. Wheat, oats, and all kinds of small grain promise fair for a bountiful harvest Corn and potatoes are doing well. Small fruit will be quite plentiful, but apples, plums, and the like, will be scarce, as they were injured by frost. C. H. L.

MINN., Preble, Filmore Co., June 21.—All kinds of grain are looking first-rate. Potatoes I never saw looking better for this time of year. Fruit is rather poor—some trees are badly affected with blight. S. S. S.

IOWA, Washington, Washington Co., June 22.—We have a fair prospect for crops of all kinds. Fruit was much damaged by late frosts. M. S. W.

COLO., Bent Canyon, Douglas Co., June 21.—The wheat crop of Colorado looks most promising. Corn and potatoes are side-show crops in this State; but all crops are looking splendid, and farmers are all feeling in good spirits. There is no fruit to speak of grown in Colorado. H. T. S.

VA., Wellville, Nottoway Co., June 23.—Wheat is an average crop. Corn is rather backward, but stands very well; a large area has been planted. Early potatoes are almost a failure, on account of dry weather; late potatoes are suffering from the same cause. The peach and apple crop prospects are good. Small fruits are not much cultivated. O. C. D.

KY., Owensborough, Daviess Co., June 21.—The wheat harvest is nearly over; the quality of the grain is very good so far as I have seen. The weather is very cool for the season. Planters are backward in getting out tobacco on account of the lack of suitable sets in the early part of the season and of a suitable season now. J. W. S.

TENN., Humboldt, Gibson Co., June 21.—We are now having cool dry weather, very fine for thrashing wheat and hay-making, both of which occupations have been very lively for the past week. The acreage, yield and quality are above an average—cotton, corn, oats, tobacco and all growing crops look well, and if there are sufficient rains in July and August, all will be good. All have been well cultivated and are clean and seasonable up to the first of this month. A dry June almost always insures a good crop in our State, provided we have the later rains. The spring was backward, and cut-worms troublesome, but now crops have about caught up, and look as well as we could wish. Strawberries and raspberries are half a crop, but the amount the shipments realized was nearly equal to the prices for a full crop. Blackberries are very promising, natives not cultivated. Tons could be gathered from every waste place not in cultivation. Enough are gathered and put up in various ways for home use, only, and are very fine. They are put up in almost any way. If we had more North Carolinans, large quantities would be dried for market. Garden truck and potatoes are good. The cantharides, or striped bug, commenced stripping the vines, and generally stop their growth. Does any one know how to get rid of them or a remedy for them? [The only remedy we know of is to shake or brush the insects off the vines into a broad tin pan, or to catch them by sweeping the plants they frequent with a deep muslin bag-net. They should be killed by throwing them into scalding water for a few minutes; then, if they are spread out on sheets of paper to dry, they may be sold to apothecaries for medical purposes, as it is found that our native species of cantharides are as effective for blistering purposes as the Spanish fly?—EDS.] Every few years our crops are badly damaged by the pests. We always succeed well with the sweet potato, however. Apples, peaches, plums, &c., amount to almost nothing with us. Grapes look unusually fine now; but, as with every thing else, we can't tell what the future will be. B. F. T.

MISS., Scooba, Kemper Co., June 14, 1879.—We might have had some of the Beauty of Hebron potatoes on the table one month ago, but I wished to save the seed and have let them fully mature. I dug them to-day, and intend planting them again for a fall crop, and if they do well, I will advise you. The Pearl Millet looks fine and would do to cut now, but as I wish to save the seed I will not cut it. The Defiance Wheat is rusting badly, as all the white wheat does in this country. The birds and rust are the great enemies we have to contend with. The Blunt corn promises fairly. J. A. M.

FLA., Rixford, Suwannee Co. June 20th.—The general outlook for crops is good. Corn generally is doing well. Cotton is rather backward, but healthy—the long staple is mostly grown here. The vegetable business has proved a success, though it had to be learned. The transportation companies have given better facilities than heretofore but they are yet far from perfect. Florida will soon be the spring garden of the United States. The orange crop is promising, but I judge the trees are not as heavily fruited as last year. G. C. R.

TEXAS, Caldwell, Burleson Co., June 18.—If it doesn't rain soon, corn will be beyond help. A neighbor and myself are plowing cotton; and although it is not growing much, it looks fresh and green and holds its fruit, while those who follow the Texan plan of waiting for rain before plowing, have sickly-looking cotton which is shedding its fruit. The RURAL has already saved me $100, owing to my taking advantage of hints contained here and there in it. The children have some flowers planted at the ends of my cotton rows in sand three feet deep. I have plowed the ground five times. The rows are 4½ feet apart, and I plow 14 inches from the row and the last time, 18 inches deep. The flowers thus treated are the scarlet Cypress vine, the indigo and sky-blue Morning-glory, the Balsam vine, white and red Ricinus, Chater's Hollyhock, Mignonette, and Touch-me-not. It is only necessary to look ten steps away to where the same flowers are cultivated by deep digging, to see how superior frequent and deep plowing is to hoeing, however well done. D. H. H.

TEXAS, Circleville, Williamson Co., June 19.—Our section of Texas has suffered from a severe drought; consequently, crops are short. Wheat and oats will not average more than half a crop—say from five to ten bushels per acre. I suppose oats will yield some more, but the grain is light and the ears not well filled. Corn is very much injured. We grow potatoes in this part of Texas only for early use, and the yield was small. Fruits likewise turn out to be scarce; they are quite scattering on the trees and kept back by the drought. Crops are better in other sections, but we can not tell exactly yet what they will be, but there is a slim prospect for good crops in Texas. J. E.

TEXAS, Salado, Bell Co., June 17.—We are having a severe drought this year, in all this part of Texas, we have had but one good rain since January. The yield of wheat is fully an average one in spite of the dry weather. Oats are a fair yield. Potatoes are fine, where the right sort and good seed were planted. The fruit crop is inferior on account of dry, cool weather in spring, and unless the rains come very, very soon, corn will be a failure. E. L. M.

TEXAS, Lockhart, Caldwell Co., June 18.—Wheat is being thrashed out, and is turning out from two to fifteen bushels per acre. It will average seven or eight—less than half a crop. Dry weather caused the shortage. Corn will average about twenty bushels per acre—injured by chinch bugs and dry weather. Potatoes have matured and have been eaten up—a sorry crop. Fruit, half a crop. S. K. M.

CANADA, Cornwall, Ont., June 22.—Crops are doing well here. Hay promises to be heavy. Corn is very backward on account of frost. Early potatoes were killed by the same cause. The potato "bugs" are not so bad this year as last. W. S. T.

Industrial Societies.

PREMIUM LISTS RECEIVED.

We have received premium lists of the following fairs:

Fortieth Annual Cattle Show and Fair of the Franklin County Agricultural Society, to be held at Farmington, Me., Oct. 7-9. V. L. Craig, Sec.

Twentieth Annual Cattle Show and Fair of the Hoosac Valley Agricultural Society, to be held at North Adams, Mass., Sept. 16-18. H. Clay Bliss, Sec., North Adams.

Thirty-eighth Annual Exhibition of the Housatonic Agricultural Society, to be held at Great Barrington, Mass., Sept. 24-26. H. T. Robbins, Sec., Great Barrington.

Sixth Annual Exhibition of the Natick Farmers' and Mechanics' Association, to be held at the above town, Sept. 30 and Oct. 1. C. H. Mansfield, Sec., Natick., Mass.

Fifth Annual Fair of the Washington County Agricultural Society, to be held at West Kingston, R. I., Sept. 16-18. J. G. Clark, Sec.

Eighth Annual Horse, Cattle and Poultry Show and Fair of the Meriden Agricultural Society, to be held at Meriden, Conn., Sept. 17-19. Levi C. Coe, Sec., West Meriden.

Cattle Show and Exhibition of the Windam County Agricultural Society, to be held at Brooklyn, Conn, Sept. 23-24. Frank Day Cor., Sec. Danielsonville.

Exhibition of the New Haven County Agricultural Society, to be held at New Haven, Conn., Oct., 1-3. C. H. Augur, Sec, Whitneyville.

Thirty-ninth Annual Fair of the New York State Agricultural Society, to be held at Utica, Sept., 8 to 12. T. L. Harrison, Cor. Sec., Albany.

Twenty-fourth Annual Fair of the Otsego County Agricultural Society, to be held at

Cooperstown, N. Y. Sept 22-24. H. K. Jarvis, Sec., Cooperstown.

Fifth annual Exhibition of the Hampton Agricultural Society, to be held at Bridge-Hampton Long Island Sept 22-24. Addison M. Cook, Sec. Bridge-Hampton.

Thirty-seventh Annual Fair of the Washington County Agricultural Society to be held at the Society's grounds between Sandy Hill and Fort Edward N. Y. Sept 3-5. Frank B. Davis, Cor. Sec., Fort Edward.

Twenty-seventh Annual Exhibition of the Bradford County Agricultural Society to be held at Towanda, Pa., Oct. 1-3 Jno. F. Fox, Cor. Sec., Towanda.

Thirtieth Annual Fair of the Ohio State Board of Agriculture, to be held at Columbus, August 25-29. Jas. W. Fleming, Act'g Sec., Columbus.

Twenty-first Annual Fair of the Erie County Agricultural Society, to be held at Sandusky, Ohio, Sept. 23-26. T. F. Spencer, Sec., Sandusky.

Thirty-third Annual Fair of the Mahoning County Agricultural Society, to be held at Canfield, Ohio, Oct. 7-9. Jared Huxley, Sec., Youngston.

Twenty-fourth Annual Fair of the Gallio County Agricultural Society, to be held at Gallipolis, Ohio, Sept. 3-5. John V. Vanden, Sec.

Thirtieth Annual Fair of the Columbiana County Agricultural Society, to be held at New Lisbon, Ohio, Sept. 30 and Oct. 1-3. Richardson Arter, Sec.

Twenty-fifth Annual Fair of the Marion County Agricultural Society, to be held at Marion, Ohio, Sept. 30 and Oct. 1-3. Jas. E. Crow, Sec.

Sixth Annual Fair of the Northern Indiana Agricultural and Horticultural Society, to be held at Fort Wayne, Sept. 22-26. I. D. G. Nelson, Sec., Fort Wayne, Ind.

Third Annual Fair of the Eastern Indiana Mechanical and Trotting Park Association, to be held at Connersville, Ind., Sept. 2-5. A. B. Claypool, Sec.

Tenth Annual Fair of the Hamilton County Agricultural Society, to be held at Cicero, Ind., Aug. 26-29. L. O. Clifford, Sec.

Eighteenth Annual Fair of the Bridgeton Union Agricultural Society, composed of Park, Putnam, Clay and Vigo Counties, to be held at Bridgeton, Ind., Aug. 25-30. Dempsey Seybold, Sec.

Ninth Annual Fair of the Knox County Agricultural and Mechanical Society, to be held at Vincennes, Ind., Oct. 13-18. E. R. Steen, Sec., Wheatland, Ind.

Twenty-Third Annual Fair of the Russellville Union Agricultural Association, to be held at Russellville, Ind., Aug. 25-30. G. S. Durham, Sec., Russellville.

Twenty-Fifth Annual Fair of the Gibson County Horticultural and Agricultural Society, to be held at Princeton, Ind., Sept. 15-19. Newton Skelton, Sec.

Twenty-eighth Annual Fair of the La Porte County Agricultural Society, to be held at La Porte, Ind., Sept. 24-26. H. C. Shannon, Sec.

Seventh Annual Fair of the Cass County Agricultural, Horticultural and Mechanical Association, to be held at Logansport, Ind., Sept. 23-27. D. W. Tomlinson, Sec.

Seventh Annual Exhibition of the Inter-State Exposition of Chicago, Ill., will open Sept. 3 and close Oct. 18. Jno. P. Reynolds, Sec.

Tenth General Exhibition of the Northern Wisconsin Agricultural and Mechanical Association, to be held at Oshkosh, Wis., Sept. 15-19. R. D. Terrey, Sec., Oshkosh.

Twenty-sixth General Exhibition of the Wisconsin State Agricultural Society, to be held at Madison, Sept. 8-12. Geo. E. Bryant, Sec., Madison.

Twenty-fourth Annual Exhibition of the Mahaska County Agricultural Society, to be held at Oskaloosa, Iowa, Aug. 26-29. Ben. McCoy, Sec.

Twenty-second Annual Exhibition of the Humboldt County Agricultural Society, to be held at Humboldt, Ia., Sept. 17-19. S. H. Brewer, Sec.

Twenty-first Annual Fair of the Des Moines County Agricultural Society, to be held at Burlington, Ia., Sept. 23-26. C. M. Garman, Sec.

Twenty-seventh Annual Fair of the Scott County Agricultural Association, to be held at Davenport, Ia., Sept. 1-5. C. W. Verder, Sec., Davenport.

Twenty-sixth Annual Exhibition of the Iowa State Agricultural Society, to be held at Des Moines, Sept. 1-5. Jno. F. Shaffer, Sec., Fairfield, Ia.

Tenth Annual Exhibition of the Poweshiek County Central Agricultural Society, to be held at Malcom, Ia., Sept. 9-11. J. H. Duffus, Sec.

Twenty-second Annual Exhibition of the Warren County Agricultural Society, to be held at Indianola, Ia., Aug. 26-28. Mel. W. Park, Sec.

Nineteenth St. Louis Fair and Exposition. Premiums, $50,000. No charges for competition or room in any department. The Industrial Exposition opens Sept. 22; the live stock, fruits, etc., Oct. 10. The Exposition and Fair closes Oct. 11. G. O. Kalb, Sec.

Thirteenth Annual Exhibition of the Nebraska State Board of Agriculture and State Horticultural Society, to be held at Lincoln, Sept. 8-12. D. H. Wheeler, Sec., Plattsmouth, Neb.

Fourth Annual Exhibition of the Kansas Valley Fair Association, to be held at Lawrence, Kan., Sept. 2-5. N. O. Stevens, Sec., Lawrence.

Sixth Annual Fair and Exposition of the Neosho Valley District Fair Association, to be held at Neosho Falls, Kan., Sept. 22-27. R. P. Hamm, Sec.

Fourth Annual Fair of the Kansas Central Agricultural Society, to be held at Junction City, Kan., Sept. 30 to Oct. 3. A. P. Trott, Sec., Junction City.

Eleventh Annual Fair of the State Agricultural and Mechanical Society, to be held at Columbia, S. C., Nov. 11-14. T. W. Holloway, Sec., Pomaria, S. C.

Third Annual Fair of the Harrison County Fair Association, to be held at Marshall, Texas, Sept. 30 to Oct. 3. W. W. Heartsill, Sec., Marshall, Texas.

ANNUAL FAIR LIST.

THE following list has been compiled from original sources and will be found, we believe, very accurate. Not having heard from *all* the secretaries of local organizations, we shall shortly publish a supplementary list that will, with the present announcement, make the list of annual fairs unusually complete and trustworthy.

STATE AND INDEPENDENT.

American Institute, New York	Sept. 17, Nov. 22
American Pomological Soc., Rochester	Sept. 17, 19
Arkansas, Little Rock	Oct. 20, —
California, Sacramento	Sept. 8, 13
Canada Central, Guelph, Ont	Sept. 15, 19
Capital State (Texas), Austin	Oct. 28, Nov. 1
Central Ohio, Mechanicsburg	Sept. 2, 5
Central Wisconsin, Watertown	Sept. 22, 27
Central Nebraska, Hastings	— — —
Colorado, Denver	Sept. 23, 27
Connecticut, Hartford	Oct. 14, 17
Delaware, Dover	Sept. 22, 28
Fat Stock, Chicago	Nov. 10, 15
Georgia, Macon	Oct. 27, Nov. 1
Illinois, Springfield	Sept. 29, Oct. 4
Indiana, Indianapolis	Sept. 29, Oct. 4
Iowa, Des Moines	Sept. 1, 5
Inter-State, Chicago	Sept. 3, Oct. 18
Kansas Central, Junction City	Sept. 30, Oct. 4
Kansas City Exposition, Kansas City	Sept. 15, 20
Kentucky Assn., Frankfort	Sept. 2, 7
Michigan, Detroit	Sept. 15, 19
Minnesota, St. Paul	Sept. 1, 6
Nebraska, Lincoln	Sept. 8, 12
New Jersey, Waverley	Sept. 15, 20
New York, Utica	Sept. 8, 12
Northern Ohio, Cleveland	Sept. 1, 5
Northern Indiana, Fort Wayne	Sept. 22, 26
Northern Kentucky, Florence	Aug. 26, 30
Northern Iowa, Postville	Sept. 16, 19
Northern Nebraska, Fremont	Sept. 23, 27
Northern Wisconsin, Oshkosh	Sept. 15, 20
North-west Agl. Assn., Dubuque	Sept. 8, 12
New England, Worcester	Sept. 2, 6
North Carolina, Raleigh	Oct. 15, 18
Ohio, Columbus	Aug. 25, 29
Pennsylvania, Philadelphia	Sept. 8, 20
Rhode Island, Cranston	Sept. 9, 11
St. Louis, St. Louis	Oct. 5, 11
Southern Ohio, Dayton	Sept. 22, 26
Southern Kentucky, Glasgow	Oct. 7, 10
South Carolina, Columbia	Nov. 11, 14
South-west Wisconsin, Mineral Point	Sept. 2, 5
Tri-State, Toledo	Sept. 8, 13
Vermont, Montpelier	Sept. 9, 11
Virginia, Richmond	Oct. 28, 31
Wisconsin, Madison	Sept. 8, 12

COUNTY AND LOCAL.

MAINE.

Franklin, Farmington	Oct. 7, 9
Lewiston, Lewiston	Oct. 7, 9

NEW HAMPSHIRE.

Sullivan, Claremont	— — —

MASSACHUSETTS.

Bristol, Taunton	Sept. 23, 25
E. Hampden, Palmer	Sept. 16, 17
Essex, Lynn	Sept. 30, Oct. 2
Franklin, Greenfield	Sept. 25, 26
Hingham, Higham	Sept. 23, 25
Housatonic Valley, N. Adams	Sept. 16, 19
Housatonic, Gt. Barrington	Sept. 21, 27
Natick, Natick	Sept. 30, Oct. 2
Worcester, South Sturbridge	Sept. 11, 13
Worcester, N. W., Athol	Sept. 30, Oct. 2

RHODE ISLAND.

Washington, West Kingston	Sept. 16, 18

CONNECTICUT.

Fairfield, Norwalk	Sept. 23, 26
Meriden, Meriden	Sept. 17, 19
Milford and Orange, Milford	Sept. 10, 12
New Haven, New Haven	Oct. 1, 3
Windham, Brooklyn	Sept. 23, 26

NEW YORK.

Broome, Whitney's Point	Sept. 23, 26
Chautauqua, Jamestown	Sept. 9, 12
Essex, Westport	Sept. 16, 18
Franklin, Malone	Sept. 29, Oct. 2
Genesee, Batavia	Sept. 30, Oct. 2
Gouverneur, Gouverneur	Sept. 2, 4

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, JULY 5, 1879.

THE LOWLY SHALL BE EXALTED.

A DAY'S ramble in the forests or fields, with eyes to see with, and with the perceptive or observing faculties brought into use—for we often see that which we do not observe—will be sufficient to convince any one that we are neglecting the culture of beautiful native plants, merely because they are common, while we are paying large prices for foreign ones less beautiful, but rare.

Take the family of Ferns, for example, with its hundreds of varieties, large and small, coarse and fine, differing in style and shade of color to that extent that a large area could be devoted to Ferns alone while we should still have but a single specimen of each, but such specimens as many lovers of plants in other countries would be glad to possess at almost any price. Then, see the little care they need. Being perfectly hardy and doing better in shade than elsewhere, they may be said to take care of themselves. Once place them in a proper position and they will soon be things of beauty and joys for a long time, if not forever. No home, whatever its size, either in country or in city, should be without a collection, large or small, as is convenient, of our native Ferns.

Then, again, there are hundreds of our native grasses that "waste their beauty on the desert air." Grasses that will hold their own as to beauty with many of the imported varieties. They lie, usually, unseen and unsought in hundreds of byways and unfrequented nooks. We are glad to say, however, that there is a probability of their being brought into more general notice. One gentleman residing near New York, who knows a good thing when he sees it, whatever may be its rank or station, sent some specimens to Europe a few years ago and seems likely to benefit by the venture, as they are becoming quite popular there, and he is now commencing their propagation for export on quite a large scale. We noticed at the recent Horticultural Exhibition in this city, that many visitors stopped at the table on which was a large assortment of wild plants, flowers and grasses that had been gathered and arranged by Dr. Hexamer, and it was amusing to hear the exclamations of wonder that were excited. "Can it be possible," said one, "that these are growing wild all about us, and that we have never noticed them?" We doubt if those who saw them will ever be entirely blind to Nature's common beauties again, and Dr. Hexamer did a good thing, if only in an educational way, by making his exhibit.

We saw, some years ago, at one of the many pleasant summer resorts on the shores of Lake George, a small bouquet of wild flowers gathered by a lady in one of her mountain rambles, that, arranged with taste, was exquisitely beautiful. She was a stranger in the vicinity, and appealed to a woman, an old resident, for the names of some of them. The woman regarded them with a look of scorn, and merely replied: "Oh, them's some kind o' blows!" [In some parts of New England, and adjoining portions of New York, "blows" is used to signify blossoms or flowers.]

Of the plants in our own garden, one that we prize highly, and which excites the admiration of all visitors, is Fumitory, the seeds of which were sent us by a friend who gathered them in the Alleghany Mountains. A graceful, climbing vine, biennial, growing from self-sown seeds, it is without its equal for giving an elegant and tasteful effect to vases of cut flowers. If the Dandelion, the Buttercup, and the Ox-eyed Daisy, were only to be had by importation from China or Japan, they would be eagerly sought for. Some have found that the Buttercup produces double flowers by the slightest cultivation, and have given it place because it differs from the common wild one; and many a country maiden would be surprised to see with what pleasure a city girl possesses a few Daisies. They *are* pretty when scarce, else our friend Allen could not have sold, as he did, the few flowers he forced to blossom last Easter for $1.50 per dozen.

No doubt it would astonish readers of the RURAL if they could know how much is annually paid for American plants that have found an abiding place abroad, and are returned with new names, to be highly prized and cherished as rare novelties. A new name sometimes adds immensely to the sale of a plant, as some high-sounding title gains admission for persons without merit to a certain class of society. A friend, residing near New York, whose name would be well known to many Ruralists, told us of a visit made to his grounds by a lady possessed of more conceit than wisdom. She had bored him for an hour with silly questions as to the name of this or that plant, usually claiming that she had it at home and had forgotten its name. Passing a modest little weed that had been by oversight allowed to remain in the border, she inquired, "What is that?" "*Roadsidii Vulgaris!*" was the reply; "Have you it?" "No," she said, "we had it last year, but lost it. I did not recognize the plant, but remember the name distinctly, and must beg you will send me one at the proper time for transplanting, for it is perfectly lovely."

It is not to such that we must look for the elevation of our native plants to the position to which their merits entitle them, but to those who appreciate the beautiful wherever found. If a system of exchanges could be introduced, by which the plants common in one section could be sent to places where they would be rarities, it would aid much in carrying out the desired end.

RELATIVE INTELLIGENCE OF FARMERS.

WHILE we shall continue to insist, until new light breaks in upon us, that there are a good many profitable things in their business yet to be learned by the farmers of America, and that a good education of the right kind is required by every young man who aims at excellence in the pursuit of agriculture,—while we hold these statements to be self-evident, yet well worth being kept before the people—we still believe that the farming class really give as much attention to the science of their art, and read up as well on their business as any class in the country, and much better than some.

Take, first, those classes which receive a special education—the so-called professional classes—and compare them with the farmers in this respect. Beginning with the ministers, and taking all the denominations together, how many of them had a sufficient preparatory education, are sound theologians, or men of real breadth of culture or catholicity of thought? Take the physicians, and what proportion of the men in this profession are thoroughly skilled in anatomy and physiology, competent and reliable diagnosticians, safe and effective in their therapeutics, ready and apt in surgical practice, sound hygienists, careful observers and earnest students? Among our lawyers, how many of them deservedly stand high with their brethren on account of their sound knowledge of the principles of law, extensive acquaintance with the statutes, skill as advocates, reliability as counsel, or for general juristic ability? And what proportion in all these professions are to any great extent noted for their love of knowledge outside of their immediate needs? How many patronize their professional journals better than the farmers patronize the agricultural press?

When we go outside of the learned professions, and inquire into the state of things among business men and artisans, how do we find it? How many merchants know more of their business than its routine? How many are acquainted with the laws of trade and finance as laid down by the great writers on these subjects? Are the works of Adam Smith any more likely to be found in the hands of the average merchant than are the writings of Liebig in those of the average farmer? What, even, do our bankers know of scientific finance; or how many of our statesmen (so-called) are there who are students of the works of the leading authorities on subjects relating to the art of government, either in monarchies or republics?

Do the manufacturers, as a body, make a study of the literature, rich and varied as it is, of the branches of knowledge in direct relation with their respective industries? And when we come down to hard workers in the useful arts, the mechanics of the country, how many of them take and read their trade journals, or study the hand-books written for their practical instruction?

Looking over the whole field in this way, we are compelled to award to the farmers a very high comparative position. While they are far behind where they ought to stand, and where they might easily stand, they cannot be regarded as laggards when put in comparison with most other classes. To be sure, in a country where land is so plentiful and cheap, and where consequently it is so easy for every industrious laborer to become the owner of land, we necessarily have a vast number of illiterate men engaged in tilling the soil. But with all this, a close investigation will show that the farmers as a class compare favorably with any other as lovers of knowledge, and as progressive workers in their art and business.

THE REWARD OF ENTERPRISE.

GREAT efforts have been made for some years past to make the culture of the Angora goat profitable. Goats have been kept and bred, but not one in a thousand has paid with its fleece for its feed. The fleece has not met with a stable market; and where but few of the animals have been kept, the mohair was found unsalable and worthless. Competition with a foreign and imported article, which came to hand in more presentable shape than the native product, and the neglect of the manufacturers of mohair goods and braids had to be contended with. At last those who had invested large sums of money in goats and pastures became determined to find a way out of the difficulties with which they were beset, and as there was a will there *was* a way. A factory was established in San Jose, California, which in a few years passed from an experiment to a success, and the Angora Robe and Glove Company has an established business, and employs fifty operatives; half of which number are women. A tannery for dressing goat skins is connected with the factory, and this has made a market for the skins, which heretofore were without value, because there was no use for them.

This successful effort at combination, to utilize an agricultural product, is worthy of note and emulation. We greatly need a diversity of products, and to secure home markets for these as well. There are many promising ventures just now in abeyance. Sumac is an article of general use, and our native product, if gathered about this time and properly prepared, is equal to the best foreign. We have some native textile plants of the most valuable kind, but none seems inclined to experiment on their growth and manufacture. We *can* make beet sugar if we will, and we can do many other useful things profitably. The enterprise and the money are needed; the latter can be had if the former is forthcoming.

WEEVIL-EATEN PEAS.

THE Country Gentleman says:

WEEVIL-EATEN PEAS.—The RURAL NEW-YORKER insists that very few seed peas infested by the weevil will grow. The experiment was made of selecting seventy peas that contained the insect, and carefully planting them. Only one out of seventy grew, producing a sickly plant. These peas had been undoubtedly pretty thoroughly cut by the insects; but when they have not destroyed the plumule the peas will grow.

We do not know to what extent the peas were "cut by the weevil." We selected, as we found them, seventy peas that had been inhabited by the grub of this insect, from a quart or more, and planted them as we would any other peas. It *might* have happened that we hit upon those in which the embryo had been destoyed. But this seems improbable. "If the plumule is not destroyed, the peas will grow." Suppose *all* of the cotyledons are destroyed—will they then grow? We think not and believe it will be found (1) that weevil-eaten peas are generally worthless; that (2) they are injured in proportion as the cotyledons are injured (of course always supposing the plumule is not eaten) and that (3) at least nine-tenths of such peas, taken as they come, will not germinate at all. Since we published our experiment we have received a dozen letters or more, stating that our experiment was not trustworthy. We are therefore trying another experiment with 100 weevil-eaten peas, planted with much care in moist soil, and if necessary to settle the question, we will try still another. It is important to *know* whether weevil-eaten peas are good or worthless. If the latter, it is not right that farmers or gardeners should pay the full price for seeds, one-tenth at least of which will fail and which might easily be rejected by the seedsman. If wrong, we shall "own up." It is easy to arrive at the truth in the matter.

THE FARMER'S NEED.

"THE cultured man," says the Prairie Farmer, "is the reading man, and the reason why the farmers as a class are not cultured men, is because they do not read."—The farmer who depends upon farming for the support of himself and family is obliged to work very hard. We ask the question, "Is there any class of people that work as hard as farmers do, that read more?" The benefits which Agricultural Colleges may confer upon agriculture will no doubt be recognized more generally in the future than they have been in the past. We believe that if the money expended on colleges which fit our young men to practice law and medicine were expended upon agricultural colleges, the country would ultimately be the gainer. We want, also, primary agricultural schools, that shall fit the pupil to enter the agricultural college. The fundamental principles of what is called an education are the same. It is the adaptation of these principles to a special pursuit that calls for special study of all facts that bear upon it. The object of an agricultural education should be to produce the best results with the least labor. Give our farmers' sons the education, therefore, and there will be lack neither of inclination nor of time for all necessary study and reading.

AGRICULTURAL JOURNALISTIC CANDOR.

IS IT EXTRAVAGANCE?—"The RURAL NEW-YORKER, of June 14th, replies to the remarks made on the above subject in the Farmer of May 31st. "but carefully avoids mentioning" the source of the criticism. The reply is courteous, and harmonizes with the general tone and teachings of that journal, which, we are free to admit, are truthful and wholesome."

We wish to thank the Ohio Farmer for the candid words embodied in the latter part of the above paragraph. We would to Heaven that there were more leading agricultural journals that place the good of agriculture so far above selfish considerations that, regardless of personal likes and dislikes, they could afford to praise where praise is due.

BREVITIES.

Sow buckwheat.

PLANT plenty of cabbages. They will furnish a most valuable green food for all the animals of the farm during winter.

OUR friend Mr. Peck expresses the opinion that the Wilson Strawberry is at about the hight of richness in sugar and acid.

DURING the heat of summer commence work early and continue it late—but take a good, wholesome rest in the middle of the day.

READERS of the RURAL, are you exerting your influence against horse-racing at "Agricultural" fairs? Or do you approve of it?

THE currant worm may be destroyed by scattering over the bushes a mixture of a pint of white hellebore, a pint of flowers of sulphur and a peck of sifted coal ashes.

IT is not too late to plant Cat-tail ("Pearl") Millet. Seeds sown now will germinate in four days, if the ground be moist, and the plants will soon overtake those sown earlier.

OUR rye is a splendid crop. It is not hard to find straws six feet high and we have just measured one (June 25) that is six feet nine inches from the surface of the ground to tip of the spike.

ATTENTION is called to Mr. Downing's remarks about Stuart's Golden Apple. He says he thinks "it worthy of notice." From the specimen Mr. Downing sent us, we think it worthy of a good deal of notice.

MR. CHARLES DOWNING writes us, too late for insertion elsewhere, that the cut of Stuart's Golden Apple is a trifle inaccurate, one side being a little too large. The fault he attributes to the imperfection of the specimen sent to us as a model.

MANY of the old farmers about us use the leaves of the Red Cedar (Juniperus Virginiana) in place of sulphur and kerosene for ridding nests and henneries of lice. They say the remedy is very effective. Perhaps perches made of the wood would serve the same purpose.

MR. SEALY, a florist near the Rural Farm, thinks highly of the new double Geranium "Jewel." The individual flowers are small, but the petals are enduring, and it is, therefore, one of the best varieties for bouquets. The color is a deep crimson, the leaves small and the plant dwarf.

LAST summer about this time or a little later, we dug up about 50 of the suckers of Raspberries and set them to form a sort of boundary between two parts of our garden used for different purposes. They all lived, were not as much harmed by the winter as older plants of the same varieties, and many of them are now in bearing.

WE planted in the afternoon of June 19, a plot of Blunt's corn 33 feet square—or one-fortieth of an acre. The corn was soaked for 16 hours in water. Two-thirds of it are now (June 25, noon) an inch above ground. We have no doubt this will overtake the one-quarter of an acre planted five weeks or more ago. Instead of coating the seed with tar, to provide against the depredations of crows, we surrounded the plot with a string, tied upon poles six feet high, on which at distances of two feet, long narrow strips of tin were tied. The fluttering of these tins and their reflection of light may serve to keep the crows at a distance. Whether they will intimidate crows or not, we are positive they will frighten horses, as one of our men learnt while plowing an adjacent field. The horse, at first surprised and affrighted, became uncontrollable as flash after flash of sunlight struck upon his eyes. He wheeled about and ran twenty yards or more, before the man, who was dragged along between the rows of corn, could regain his feet and restrain him.

Literary Miscellany.

ONLY GOING TO THE GATE.

LIKE a bell of blossom ringing,
Clear and childish, short and sweet,
Floating to the porch's shadow,
With the faintest fall of feet,
Comes the answer softly backward,
Bidding tender watcher wait,
While the baby queen outruns her,
"Only going to the gate."

Through the moonlight, warm and scented,
Love to beauty breathes a sigh,
Always to depart reluctant,
Loth to speak the word "good-bye";
Then the same low echo answers,
Waiting love of older date,
And the maiden whispers softly,
"Only going to the gate."

Oh, these gates along our pathway,
What they bar outside and in!
With the vague outlook beyond them,
Over waves we have not been.
How they stand before, behind us!
Toll-gates some, with price to pay;
Spring-gates some, that shut forever;
Cloud-gates some, that melt away.

So we pass them going upward
On our journey one by one,
To the distant shining wicket
Where each traveler goes alone—
Where the friends who journey with us
Strangely falter, stop and wait,
Father, mother, child or lover,
"Only going to the gate."

AN UGLY GIRL.

(Continued from page 414.)

CHAPTER XXVIII.

UNDER THE SPELL.

NOEL scarcely knew how to reply to Herr Rudolsheim's strange questions; but who can resist the longing inherent to our natures to pry into the inscrutable?

"If you can indeed do this——?"

"Try me," said the Herr. "I do not boast of the power that I think I possess. I have admitted that I may not succeed in what I do propose to attempt; but what then? You shall jeer at me if you will, and I—knowing what I know—shall still be able to bear your sarcasm with stoicism."

"I must confess that I have no faith in your skill." Noel frankly told him.

"So be it; then will mine be the greater triumph if I convince you. But stay; here is the good Jephson with your lamp. Now can I scrutinize your looks, and ascertain if your nerves are in condition for the enterprise."

He felt Noel's pulse, and nodded approval of its regular pulsations.

"It is well; you are neither fluttered nor feverish; still, it will be but a wise precaution that you should swallow a few drops of wine, if your physician does not forbid it."

Satisfied on this score, he bade Jephson bring some, poured out a glass for Noel, another for himself, and then, putting out his hand to extinguish the lamp, asked:

"Shall it be now? Are you prepared?"

"Stay," exclaimed Lord Carlsforde. "Before we go any further, let me know precisely what it is you are promising to do."

"To exert a power—latent in all of us—that of influencing the minds of others. I shall will that Miss Carlsforde comes here to you, and answers you when you address her."

Noel laughed outright, for he had overcome the impression made upon him at first by Herr Rudolsheim's earnestness.

"You are promising marvellous things, *mein Herr*. I can only say as I did before, if you can achieve this, I will never doubt again."

"So well so good," said the German, unmoved by his scoffing tone. "I ask again, are you ready?"

"Must your experiment be made in darkness? Is this the opening scene of some little drama you have arranged for the purpose of mystifying me and amusing yourself? And where do you intend to take *your* stand while it progresses?"

"I shall seat myself here by you; I shall keep my finger on your wrist, that if I detect any symptoms of an excitement that may be prejudicial to you, the spirit I have summoned may depart and trouble you no longer."

As he spoke, Herr Rudolsheim drew his chair closer to the easy one in which Lord Carlsforde was reclining. He sat for a minute or so steadily gazing into the eyes that at first returned his gaze as unblenchingly, then wavered and ached so strangely that Noel was forced to close them. When he opened them again, the room was in darkness, except where, betwixt the curtains of the window, a ray of moonlight had stolen and gleamed upon the oaken panelling of the walls with a faint, phosphorescent light.

* * * * *

If Noel's sensations might be relied on, hours elapsed while he sat there, no sound breaking the stillness, save the regular breathing of his silent companion. Yet he neither felt impatience nor astonishment; from the moment the Herr's eyes had looked into his, a curious, but not unpleasant lassitude had crept over him, enchaining his limbs, though leaving his mind free. He could not have raised a hand or turned his head; he was not even sure that he could have spoken had he wished it; but he did not; every emotion seemed to have been soothed to rest by the potent spell that entranced him. He would have declared himself to be under the influence of some delightful dream, if he had not known but too well that he was as thoroughly awake as when the Herr first startled him with the proposition that Miss Carlsforde should be drawn thither by the mysterious power he professed to possess.

Yes, he was awake; he knew where he was sitting; he could have repeated every word of the conversation that had occurred previous to the extinguishing of the lamp. He could even speculate with amusement on the crestfallen look the German's face would wear when forced to acknowledge that he had failed, that the spirits had refused to obey his summons, and this long watch had resulted in——nothing.

But Noel retracted that word, for the same feeling that he remembered to have experienced in the library was now upon him. He felt—though he could not tell why—that he and the Herr were no longer the sole occupants of the room. Did the German sleep that he sat so motionless? or did he not share the unearthly sensation with which the young man's blood was now beginning to chill?

The pleasant languor, so like the early hours of convalescence after a long illness, yet even more delightful than they, was gradually giving place to less agreeable sensations. A peculiar faintness, felt first in the extremities, was rendering him cold and benumbed, as if life was gradually leaving him. He found himself mechanically counting the throbs of his own heart, and conjecturing how much longer that vital organ would continue to pulsate. But these considerations brought with them no terror, no uneasiness; the brain appeared to have fallen under the same deadening influences as were affecting his body, and he was calmly awaiting the end. Nay, so utterly did all personal considerations cease to move him, that he continued to notice, as before, the only signs Herr Rudolsheim gave of his presence, his regular inspirations and the gentle pressure of his finger on Noel's wrist.

But now a long-drawn sigh floated towards him, and immediately the shadowy figure of a woman stood where the moonbeams flickered on the wall.

Then the Herr had kept his pledge. Ada Carlsforde, constrained by the will of another, had come hither; but was it in the spirit, or actually in the body? Ah! this he could not tell.

At one moment, nothing but the barest outlines of a female form were visible; at the next, he would see it distinctly, for the moon shone forth brightly and illumined the space in which, with drooping head, and features shrouded by the dark drapery enveloping her, she stood; but even as he gazed a cloud passed over the sky, the vision faded, and so intense was the gloom that he could not say whether it had entirely vanished or no.

Had she indeed gone away beyond recall? Oh! why could he not avail himself of the opportunity for which he had so often yearned! Why was he unable to address her—to adjure her to stay and hear him defend himself from his slanderers? He made a desperate effort to rise from his chair, but it was useless; he had lost the power to do so. Every limb was inert, as if paralyzed; his pulse began to beat feebly; he could no longer see, for his eyes were growing dimmer and dimmer. Was this, could this be death?

A hand, the soft, tremulous hand of a woman, fell lightly on his own, but he could not clasp it. From thence it fluttered to his brows, and gently pressed them; but now everything became indistinct to Noel Carlsforde.

After what appeared an interminable interval, he heard, or fancied he heard, a wail of agony, a piercing voice shriek wildly that he was dying; and then hot tears fell like rain upon his face. He tried to struggle out of the thraldom in which he was held, but in vain, for his convulsive throes only exhausted him and increased that distressing sensation of faintness which seemed to him, as well as to others, to herald his last moment.

But soon some one—was it the Herr?—held a bottle emitting a powerful odor to his nostrils, and Noel was relieved. He felt that he was falling into a calm, delicious sleep, and awakened from it to find Hillian Gray, her aunt and Jephson hanging over him with faces expressive of the deepest solicitude.

"Such an extraordinary attack! and what could have occasioned it?" Mrs. Hurst began to ask, as soon as she saw that she was recognized. "Never, in all her experience, and it was considerable, beginning with Hillian's mother, and never idle a week after she expired, poor dear! so peaceful, so beautifully resigned, and the best of advice, but not able to save her, the complaint being hereditary——"

But here Noel gently put the garrulous lady aside, that he might be able to see the spot where the figure had appeared.

"Is she gone?—quite gone?" he asked, in his disappointment. "What must she think of my silence? What could have taken possession of me?"

"He rambles a little, poor young man, doesn't he?" Mrs. Hurst demanded, in an audible whisper. "I thought so from the expression of his eyes. I told you, Hillian, that his brain was still suffering from that fall. Have you sent for Dr. Monson? If not, pray do so, for I have known cases where delirium commenced in this manner, and in a few hours four men were not strong enough to hold him; and Jephson isn't as young as he was, and the footman might not be of much use, especially without a straight waistcoat to fly to."

Noel could not help laughing, for Jephson was listening, open-mouthed in his dismay, to Mrs. Hurst's ominous speech.

"I am not mad enough to be dangerous," he said, addressing himself to Hillian, who had been vainly endeavoring to silence her aunt. "And I feel so much better that I do not think there will be any necessity for disturbing Dr. Monson. It is true that I have had a strange attack, but——"

Here he paused in some perplexity, and then inquired eagerly for Herr Rudolsheim.

"I am here," was the quiet reply; "very much grieved, like the rest of your friends, to see you so indisposed, and, like them, greatly relieved by your recovery."

"Thanks; but tell me——"

"We are not alone," the Herr murmured; and Noel curbed his impatience till he had succeeded in convincing Mrs. Hurst and Jephson that there was no danger of a recurrence of his illness, and they had consented to follow the example of Hillian, who had glided away as soon as she saw that her services were no longer required.

"Now," cried Noel, when the door closed behind them—"now let me hear all you have to tell me about Miss Carlsforde."

"But, my best friend, what can I have to tell you?" the Herr demanded, with an astonished air. "I will that she should come hither; I wait with you the issue of my attempt to influence her; your nerves, already weakened by your accident, play you little tricks, and suddenly you swoon, alarming me so much that I turn up the lamp; I dash water in your face, I shout for aid, and my cries bring everyone to the room who was within hearing. Is not this all I have to tell you?"

"But Miss Carlsforde came here. I saw her," Noel asserted, positively.

"Where, and when? With Madame Hurst and her niece? Then, was I too much engrossed with you to perceive her entrance? This is unfortunate, for I have great ambition to know the daughter of my much-esteemed friend, the late Viscount."

Then the Herr had not seen the figure that had stood, in the moonlight. Noel drew his hand across his brows, and knew not what to think.

Was the German in league with Miss Carlsforde to mystify him, or was all he had seen, or thought he saw, but an illusion of his own excited brain?

"You look dissatisfied," the Herr observed. "Is it because our experiment failed? Shall we repeat it? But no; I have blame myself too much for commencing it. I will not tempt you to peep into the world of spirits again."

When he had repeated his regrets for his share in what had occurred, and gone away, Noel recalled Jephson. He had just remembered fancying that the glass of wine he had swallowed seemed to have something unusual in its taste, and might, therefore, be answerable for the extraordinary sensations he had undergone. But Jephson repudiated the notion indignantly. He never brought any but the best vintages to his lordship—had he not received Dr. Munson's orders to that effect?—and the decanter of Burgundy, then on the table, was the same that had been served to his lordship on the previous day.

Growing at last quite weary of speculating as to the cause of the attack, Noel retired to rest, convinced, however, that it was no ethereal spirit, but Ada Carlsforde in the body, whose hand had timidly touched his own. But this conviction rendered him more provoked than he could express; what, indeed, could be more annoying than to know that he had not been able to seize the only chance he was ever likely to have of convincing her that he was not the heartless, unfeeling fellow some one or other had represented him.

CHAPTER XXIX.

PREPARING TO DEPART.

A LETTER from Irene arrived on the morrow to give Noel fresh food for thought, and revive all that distrust of Clement Dunforth the young man's frank manner and ready acquiescence in his wishes, had lulled.

"Maggie is recovering nicely," she said; "which is fortunate, for nurse has had bad news of the illness of her daughter, and is forced to leave me. Mamma is my patient now; you know she never will wear good stout boots, because she says they spoil her feet, which are really very pretty ones, and as she has twice been caught in a shower this week while taking her daily walk, she has contrived to catch a bad cold; but I shut my lips tightly when she makes an aggravating speech, and never suffer myself to be provoked into retorting, so we are getting on pretty well. It is fortunate that between the children and mamma I have so much to do, or else I think I should fret a little, dear Noel, for Clem's letters are really unkind ones. They are full of complaints of me, though what I have done to deserve them, I cannot tell. I am a silly, thoughtless girl, brother mine; I see that more clearly since I have been brought in contact with Hillian Gray, whom I should love dearly, if I were not obliged to doubt her. Yes, I am heedless and ignorant, but Clem has known this from the beginning of our acquaintance; why, then, does he lecture me so severely, now that I am doing my best to become more worthy of him? I ask him, but he only answers evasively, hinting that I am treating him unkindly, neglecting his wishes, and so on. Has some one been telling him anything to my disadvantage? or is it—I am almost ashamed to say this, for fear it should sound unjust, but I cannot help asking myself—is it possible that I have appeared to such disadvantage beside Hillian Gray that Clem—— I need not write any more; you will understand me. If I am right, tell me so at once; you know how I hate to be kept in suspense, and you need not be afraid that I shall give you cause to be ashamed of me. Neither Clem, nor the girl he prefers to your little sister, shall ever know how many tears his conduct has cost

"Your loving, but sorrowful,

"IRENE.

"P. S.—Don't rave out when you read this, and take up the cudgels on my behalf, for, after all, Noel dear, I think it is my pride that is wounded more than my heart."

"Thank Heaven that she is able to discover this already!" exclaimed her brother, as he re-folded the letter. "It will pain me less to see her depressed by the mortification of being jilted, than the unhappy wife of a man whose principles are so doubtful as Clement Dunforth's. Yet how am I to reconcile Irene's complaints of his unkindness, with the affectionate manner in which he spoke of her at our last interview, and his readiness to cease visiting at Carlsforde, as soon as I hinted that it might annoy his betrothed? There must be something in the atmosphere of this house that affects all of us. When I am once more in town, and Dunforth also returns thither, I will watch him closely. Before I quit England, I will take care to ascertain whether he is really attached to Irene, or forsaking her for another."

Although he would not mention even to himself the name of Hillian Gray, it galled him terribly to think of her as the successful rival of Irene. Another day, and he should have quitted Carlsforde, never perhaps to behold its inmates again; but what perplexing recollections he would carry with him of the hours spent beneath its roof! Miss Carlsforde hovering near, watching over his comfort, ready to interfere in his behalf if he were neglected by her dependents, yet never becoming visible, and, when courteously entreated to see him, recoiling in suspicion and alarm, as if his gratitude were but the cloak for deeper designs. Hillian, again so gentle, so gracious, so eager to help him forget his sufferings, treating him as if he were a dear brother, yet as soon as Clement Dunforth came on the scene, shrinking into herself, and, if compelled to address him, speaking with the chilling constraint of one who feels herself injured, and justified in resenting it.

With her he was determined to have an explanation before quitting the Park. He would not ask for it; that might put her on her guard, and give her time to decline it. As for Miss Carlsforde, he despaired of conquering her prejudices, therefore contented himself with writing a note of farewell, to be left for her as usual in the library. He had expostulated and entreated in vain, and he came to the conclusion that a quiet reiteration of his willingness to do for her any friendly services in his power, was as much as could be expected from him.

When his note was written, he sat with it open before him for several minutes, his commiseration for the unfortunate girl inducing him to ask himself if there were really nothing to be done but leave her to her forlorn, helpless self.

"Pshaw!" he suddenly cried, as he snatched up and directed an envelope. "What possesses me, that I persist in forcing my friendship upon a person who is just as eager to avoid me? It is because her hand touched mine so timidly the other night, and her tears—were they *her* tears, though;—were wet upon my forehead when I revived from that lethargy? She is not so very friendless, after all. She has her guardian, who must soon be here; and Mrs. Hurst and Hillian, who may be true to her, though false to others. When I am far away—I, who have unwillingly disturbed her life and agitated her with fears that her father's will was an unjust one—she will overcome these morbid fancies; and before long I shall hear of her settling down to pass her time happily and usefully on her own property."

When Noel had summoned Jephson, and made the few arrangements necessary for his journey on the morrow, he had a fancy to carry his letter to the library, and leave it there himself. He could now walk tolerably well with no other aid than that of a walking-stick; and, emerging from the apartments in which he had so long been a prisoner, he slowly descended to the hall below.

His spirits rose with the exertion. What though the strange will of the late peer had left him too poor to support his title? It had not robbed him of his energy or his youth. Nay, it gave him at least the power to shake off the incubus Mrs. Estcourt had proved herself. By settling on her the small sum Mr. Whitely was ready to pay over to him, he should be free from the burden of her support, and in other lands he would seek the fortune denied to him here, and forget Hillian Gray.

But when this last thought arose, a sigh broke from his lips. Would it be so easy to forget her? Would not her image haunt him wherever he turned his steps?

"Not if she becomes the wife of Clement Dunforth," he muttered "Then shall I think of her only as either the falsest or the weakest of women, and thus learn to despise her."

He moved slowly on, and, opening the door of the library, found Herr Rudolsheim its sole occupant. He was so surrounded with books, and so absorbed in the contents of the *tome* from which he was transcribing, that he did not see Noel till he stood beside him.

"Ah, ha!" he exclaimed, at last; "then you have come to return my visits—you invade me in my den. Is it not so? *Ach Himmel!* but I could not wish myself a better wish than to be immured here for weeks, months, with these my friends"—he patted the books—"to bear me company. But I am too busy for conversing. You will generously excuse me if I proceed, lest I lose the train of thought this passage has evoked. You will amuse yourself with reading till I am at leisure to enjoy your society. What shall I bring you? Periodical?—newspaper?—pamphlet?"

"Nay; I will not let you disturb yourself to do either!" cried Noel, pressing him back into the seat from which he would have risen. "I had a fancy to pay a parting visit to this room; that is all;" and as he spoke he could not help thinking that he should have dearly liked to penetrate the mystery of the concealed door; but that would have involved an intrusion on Miss Carlsforde, and must not, therefore, be attempted.

"Then you are leaving us? When? To-morrow? I am sorry to hear it, although my own stay here will be brief. But do not say that I shall see you no more. Will it be an impertinence to inquire your plans?"

"No; for I am sure your questions are kindly intended," Noel replied; and, as concisely as he could, he explained to the Herr how he had determined to go abroad.

"But there are four, five great continents to choose from. To which of them do you direct your steps? Pardon again my inquisitiveness; but I have good friends in Asia, the two Americas, and even in Africa, who might be of help to you, unless you are already independent of it."

"By no means; and I shall accept your kindness with gratitude," Noel eagerly replied. "I intend leaving England; but what to do or where to go cannot decide; and the only person who has offered to further my intentions is one to whom I would rather not lie under any obligation."

The Herr nodded significantly.

"I comprehend. You speak of that wonderful young man, Mr. Dunforth. It is for you that he is moving heaven and earth to procure a berth now vacant in the office of one of our West Indian governors, is it not?"

"It may be so; yet it is odd that he did not apprise me of it," said Noel, surprised to hear this.

But the Herr, with one of those shrugs that mean so much, answered:

"Not so, my good friend. If he say to you there is a clerkship vacant, but the pay is poor, the island unhealthy, the governor an irascible old military man, whose appointment was given him because he was troublesome to the ministry, and they would fain be rid of him, you might fain say to yourself, '*this wonderful young man seeks to be rid of me also*;' but if he secure the berth for you, and come, open-armed, crying: 'Rejoice, brother of my betrothed! my exertions have procured you the opening you seek; you may climb to fortune if you will, for I have found you a situation in the palace of Sir Somebody; and this palace is placed upon a lovely tropical island, where you shall repose on flowers, and quench your thirst with the juicy melon, or the exquisite pine-apple,' what should you say but thanks?—what should you think but that he is the kindest of men?"

"Mein Herr, you distrust Clement Dunforth?"

"I have studied his character, and——" another shrug.

"How can I be in his way?" queried Noel, thoughtfully.

"How shall I, a stranger, tell you?" retorted the German. "That it is so, my eyes, my ears, have convinced me; but for the why and wherefore, I cannot say."

Noel mused again; but still he would not yield to suspicions that seemed so groundless.

"Mein Herr," he said, with a forced smile, "it is one of our English maxims neither to speak ill of the dead nor the absent. Clement Dunforth is not here to defend himself, or explain what may seem tortuous in his proceedings; so I will defer my judgment till I see him again. Then I will not part with him till he has given me convincing proofs that he is the upright, honorable man to whom alone the happiness of my young sister ought to be entrusted."

"You are right in this," said his hearer; "for Miss Irene is charming in her frankness and vivacity. If I have obtruded my studies of human nature upon you too boldly, forgive me. I shall hope that in this particular one I err, and that Monsieur Dunforth will prove himself altogether excellent. But you say we abuse the absent. How do you mean? Mr. Dunforth is here at this moment."

"Here!" exclaimed Noel.

"Not in this room certainly," the Herr replied; "but at Carlsforde. You know it not? Ah! now I bethink me his visit was not intended for you. I saw him pass the window; I inquire for him, that I may ask the favor of conveying for me a letter to the post at Corby, and I am told that he is engaged; he is with Miss Carlsforde."

More startled than before, Noel inquired if he was sure of this.

"I am very sure," said the Herr, composedly. "Did I not tell you he is wonderful, this young man, Dunforth? He has fertility of resource, invention, enterprise, quite astonishing. Look into his brains, and my life upon it, you would discover that he suggests to himself the possibility of wooing and wedding that heiress whom you, with your nicer sense of honor, decline to court."

"He could not be villain enough to dream of this!" exclaimed the incensed Noel.

"Why could you call him villain?" asked the German, tranquilly. "Unless, indeed, he is committing some treachery——"

"Good heavens! do you forget that he is positively engaged to my sister?"

"And that he is always whispering sweet nothings in the ear of the *fraulein* Gray? No; I forget nothing. I am curious to know how he will thread his way through the intricacies of a game that requires playing with so much skill."

"He shall be foiled in it before he goes any farther. I will not be a passive spectator of such villainy!" cried Noel, more excitedly than before. "Where is he?" and he strode towards the door. "I will insist on seeing him immediately. How dare he show himself in this house, after promising me that he would intrude here no more!"

Herr Rudolsheim began to inculcate the wisdom of calming himself before he took any steps in a matter of such importance; but Noel, who scarcely heard him, was already at the door; and, smiling furtively at the young man's vehemence, the savant returned to his books, and forgot him.

CHAPTER XXX.

AN ANGRY INTERVIEW.

Noel returned across the hall to the pleasant summer parlor, in which he learned from a servant he encountered that Mrs. Hurst and her niece were accustomed to sit. It was empty; but, as he stepped slowly and painfully towards the long French window that looked into the gardens, it opened, and Hillian Gray appeared. She looked confused when she first saw Lord Carlsforde; but, quickly recovering herself, congratulated him on his appearance downstairs, and drew forward the easiest chair she could find for his use.

Insensibly Noel's angry feelings were softened by the spell her presence always cast upon him. Besides, if it was as he feared, and Clement Dunforth's wily tongue had won him a place in her heart, was she not as much to be pitied as Irene? How would she bear it if she were obliged to learn that he had only courted and flattered her, that he might, by her means and influence, work his way into the good graces of her patroness? She—Hillian—must be undeceived, as well as Miss Carlsforde; and then Noel bit his lip impatiently, and asked himself how it was to be done?

If he asserted that Clement was a dishonorable fellow, attracted by Miss Carlsforde's wealth, Hillian, prejudiced against him already, would most probably refuse to believe it, and the heiress might prove just as incredulous. Besides, what proof had he to give of his assertions? None. Clement was still writing punctually to his betrothed, and the hints and suggestions of Herr Rudolsheim were all that Noel had to urge against him.

He gave such a weary sigh, that Hillian, who had retreated to a flower-stand, where she found employment in nipping off the dead leaves from some geraniums, looked quickly round.

"Has the exertion of coming down stairs proved too much for your lordship? Shall I fetch you some wine? or will you lie down on this couch?"

"I will go back to my room," said Noel, rising with difficulty. "I must have time for thought, time to decide how to act, and what I ought to say."

Hillian looked concerned, and even alarmed, at the agitation under which he was laboring; and when she saw that he was about to quit the room, she hurried to offer him the support of her arm.

At first it was coldly refused; but when one quick glance showed Noel how the tears were springing into her soft dark eyes, her hand was suddenly grasped, and she was drawn towards him.

"Hillian, we may not meet again, for in the morning I shall bid adieu to Carlsforde forever."

"Are you in earnest?" she gasped. "No—no, you only say this to—to betray me into admissions that I will never, never make."

Her hand was instantly released.

"I will not ask you what this speech means," said Noel, speaking now in sorrow more than anger, "I have heard enough to know that you as well as Miss Carlsforde have been taught to think ill of me. Think so still, if you choose. I might ask you if a single action of my life since I have resided here warrants you in believing aught to my discredit, but I will not. To combat charges made in the dark, would degrade me, and I should lose my temper in the effort. Only, while you doubt me, beware that you place not too much faith in my traducer."

"Stay, sir," cried Hillian, proudly, "and hear this much, if you will hear no more. If I have learned to think you not so entirely the honorable gentleman as Lord Carlsforde's successor should be, it was through your own act."

"Indeed! May I know what that act was?"

"The unmanly one of introducing into this house, as a spy upon me, Mr. Clement Dunforth, whom you had already employed to search into my earlier life. To hold over me the fear of exposure, by hinting at your knowledge of the only follies that ever disgraced it, was cruel indeed."

"I introduced Dunforth, that he might annoy or injure *you*? You—Hillian, whom I——But what am I saying? You were present when Irene divulged her engagement; you knew that it was not by my desire he came here."

"I know that you did not appear to wish it; but I have since been assured that an arrangement had been secretly made for his coming."

"Who dares say that I could be guilty of such deliberate treachery to the generous girl who thought no trouble too great in waiting upon and watching over me? But I will not ask—in fact, I need not; there has been more villainy at work than I suspected; and I am not the only dupe of it."

"Prove that you are innocent——" Hillian began; but was sternly interrupted.

"Innocent of what? Are you going to be so obliging as to detail to me all of which I am accused, expecting that I shall protest that I am not guilty of this or the other? I tell you again, I will not stoop to defend myself from any charges brought against me thus. I will not even bid you tell me what they are, lest they make me a murderer at heart, if not in deed."

"My lord, you know not what you are saying," faltered the terrified Hillian.

"I know that Clement Dunforth—a judgment be upon him!—has poisoned the mind of the creature who was dearer to me than all the world. Yes, Hillian, now that I am parting from you and England, now that you have taken from me my only hope—shall I tell you what that hope was?—will it gratify you to know how I dwelt on the thought that some day, if fortune smiled upon my efforts, I might come and ask you to share my home? And now that you have robbed me of that hope, I declare to you that never by thought or deed have I proved myself undeserving of the love I once hoped to win."

Hillian sank on the nearest seat, and covered her face with her hands; but she did not speak, and Noel, having thus unbosomed himself, suddenly became calm.—To be continued.

MAGAZINES.

ST. NICHOLAS FOR JULY has eighty extra pages and more than eighty illustrations. It opens with a country story, Dru's Red Sea, illustrated by Walter Shirlaw with a picture—the frontispiece of the number—which shows the young heroine on the roadside startled by an old traveler. Next comes Nid-Nodding, a summer poem by Lucy Larcom, followed by an illustrated account of cod-fishing from a small row-boat on the banks of Newfoundland. Farther on comes Blown Away, a thrilling story, with a spirited picture of a thrilling railroad incident. Boys and girls both, will take interest in the paper entitled, How to make a Hammock, with its ten plain diagrams, and clear descriptions of the process. Blossom-Boy of Tokio, an article by Professor William Elliot Griffis, tells of the curious ways of Japanese children, and contains thirty-two drawings by Japanese artists in their odd style. Mr. Moncure D. Conway contributes a story—The Child and the Image—suggested by an actual occurrence and illustrated with two pictures by W. J. Hennessy. The Fourth of July element finds expression in a stirring Patriotic March, a piano piece for four little hands, composed by William K. Bassford; in Rattle-te-bang, verses with hmzzas and drum beats in every line; and in Hay-foot! Straw-foot! an amusing picture of the drilling of an awkward squad of recruits. Glories, by Sarah Winter Kellogg, with seven of Addie Ledyards's lovely pictures, narrates the happy fun of two children in a game with morning-glory blossoms. A Jolly Fellowship, Frank R. Stockton's serial story, takes his heroes through an exciting diving episode, and leaves them aboard a burning ship; and Eyebright, the continued tale by Susan Coolidge; brings its chief character to the threshold of an adventure in a sea-cave. Funny verses, comical pictures, gay jingles, a page of bright contributions from the young folks themselves, and Departments brimful of good things, help to complete a number exactly suited to summer-holiday reading.

ABOUT MACARONI.—The first stanza of the old song entitled "Yankee Doodle" runs:

"Yankee Doodle came to town
Upon a little pony;
He stuck a feather in his hat,
And called it macaroni."

It is about this expression, "macaroni," I wish to write what I have found out by asking questions and reading in books.

In England, during the reign of Queen Elizabeth, most of the dandified things of that time—such as table-forks, etc.—came from Italy, and were called "macaroni," which is Italian, derived from a Greek word meaning "very dainty."

About the time of Oliver Cromwell, appeared a verse which some have thought was meant to make fun of him. The verse runs:

"Yankee Doodle came to town,
Upon a Kentish pony.
He stuck a feather in his hat,
And called it macaroni."

But history says Cromwell came from Huntingdon; and I think he was not the kind of a man to wear feathers and brag of them. He was stout, red-faced, and rather rough; not slim and foppish.

In Sheridan's play, "The School for Scandal," are these lines:

"Sure, never were seen two such beautiful ponies;
Other horses are clowns, but these, macaronis.
To give them this title, I'm sure can't be wrong,
Their legs are so slim, and their tails are so long."

Washington Irving tells us that, in the War of the Revolution, some Maryland regiments, who wore very gay uniforms, were known as "The Macaronis;" and he adds that "they showed their game spirit." So, it seems, they could fight well, besides dressing well.

Another author says: "A hundred years ago, the slang for a certain sort of fop was 'macaroni.' He was distinguished chiefly by the strange way in which he dressed his head; and he wore feathers in his hat."

This is all I have been able to find out about the word "Macaroni," used in the song "Yankee Doodle;" and it seems to mean something or somebody very dainty or finical, and to have very little to do with the food called "macaroni," although that also comes from Italy.—*St. Nicholas for July.*

PROBABLY the most important feature of the July SCRIBNER (and one to be continued in the Midsummer Holiday number) is the reprint of the celebrated engravings, made several years ago by Mr. Henry Marsh, for Harris's "Insects Injurious to Vegetation,"—a volume issued by the Massachusetts State Board of Agriculture, and necessarily at such expense as to put it beyond the reach of the general public. The papers in SCRIBNER are entitled "Summer Entomology," the first dealing with moths and butterflies, with most beautiful and accurate illustrations, the drawings having been approved by the late Professor Agassiz. In order to bring out to their utmost the delicate gradations and softness of these cuts, they will be printed upon extra-calendered paper. It is no exaggeration to say of these engravings that they have never been equaled in Natural History work.

SCRIBNER'S MONTHLY for July: The American on the Stage, Illustrated, J. Brander Matthews; Friend Barton's Concern, Illustrated, Mary Hallock Foote; Evening, John Vance Cheny; The Water-Cure, Austin Dobson; Brazil. III. An Indian Village on the Amazons, Illustrated, Herbert H. Smith; The Sphinx, Elizabeth Stuart Phelps; Haworth's. Chapters XLI-XLIV., Illustrated, Frances Hodgson Burnett; Two Couples: White and a Yellow, William M. Baker; Madame Bonaparte's Letters from Europe. (Conclusion), Eugene L. Didier; Summer Entomology. I. Tramps after Moths and Butterflies, Illustrated, Edward A. Samuels; Thomas Moore, Richard Henry Stoddard; American Museums of Art, James Jackson Jarves; The Metric Reform, Frederic Brooks; The Whip-poor-will, Henry S. Cornwall; Flowers for Song, Thomas W. Parsons; Trinity Parish, Illustrated, William H. Rideing; The Delusions of Clairvoyance, George M. Beard; The Flooding of the Sahara. (With Map), John T. Short; Edison's Inventions. II. The Carbon Button and its Offspring, Illustrated; The Confession, Joel Benton; Topics of the Time. Engraving on Wood—Mr. Riddle's Book—College Instruction; Communications. Thoughts upon the Education of Women—The New Museum in Rome; Home and Society. Decoration of the Dinner Table (Sacharissa)—A Military Education at West Point (W. H. Rideing)—Hints to Young Housekeepers. VII. (Mrs. S. W. Oakey); Culture and Progress. Matthew Arnold on Equality—The Epic of Hades—Seiss's Miracle in Stone and Voices from Babylon—Gosse's Studies in the Literature of Northern Europe—Plato on Socrates (The New Translation)—Boyesen's Falconberg—Mansfield's Personal Memories—Cable's Old Creole Days—Stockton's Rudder Grange—A New Edition on Longfellow—Mr. Marshall's Recital's; The World's Work. Novel Method of Testing Iron Wire—New Salt-Water Condenser—Improved Refrigerating Apparatus—The Horograph—Improved Violin—A New Gun—Removing Metalic Substances from Grain—New Method of Making White Lead—Proposed Treatment of Hop Vines for Fiber; Bric-a-Brac. The Heart of a Rose (H. W. Austin)—Studies in Style (Irwin Russell)—Adrienne (J. W. W.)—College Comicalities (Arthur Penn), drawings by Hopkins—Union Square: 7 P. M. (J. B. M.)—Speaking Features (N. H. D.)—The Hit of the Season (drawing by W. M. Davis, Jr.)—Metrical Gymnastics (H. C. Bunner.)—Punch and Judy at Rockaway Beach (drawing by H. P. Wolcott).

THE SUCCESS OF CLAIRVOYANTS.—In a paper in the July Scribner on "The Delusions of Clairvoyance," Dr. George W. Beard, of New York, writes as follows:—The practical success of clairvoyants, public and private, is the result of these three factors: 1. guess-work reduced to a science and an art, 2. coincidences, and 3. trickery.

Guessing is at once a science and an art,—a science, because it may be regulated by certain principles. The familiar "guessing game" illustrates what can be done by guessing scientifically carried out; with the privilege to the guesser of but twenty chances, he may yet, beginning with the kingdom to which the article belongs, reach the most minute object before his list is exhausted. Success in this game, as all who have played it know, depends much on practice. Clairvoyants devote their lives to the practice of this game, for they play it with every victim they meet.

The subject of coincidences is one that has excited far less attention among the students of history or of human nature than it deserves; little, indeed, has been written upon it. Among those who have given the subject any thought, the most erroneous impression prevails that it can be brought under the laws of pure mathematics. In the life of every active human being are frequent, almost daily occurring, coincidences, which those who give any attention to them may, if they choose, make the basis of most absurd delusions. Usually we give no more attention to these occurrences than an exclamation of surprise, and then forget all about them. We are talking of a person whom, perhaps, we rarely meet, and have not seen for a long time; suddenly he appears. A thought—out of the ordinary course, it may be—enters our mind; we express it, when behold! the same thought has just been passing through the mind of our friend. We meet with a certain experience, and then we remember, or fancy we remember, that the same experience has happened to us in a dream. Of all these daily and hourly happening coincidences, clairvoyants skillfully avail themselves, and in that direction they are aided by the ignorance and eagerness of their victims.

The trickery of clairvoyants consists mainly in the art of making their victims unconsciously reveal, by word or look, facts of personal history, and then, at the proper time, in re-imparting the information to them. In this way they gain the credit, even among persons of keen intellect, of being endowed with divine powers.

In drawing out the facts of personal or family history, clairvoyants do not always ask direct questions, but rather make statements with an implied interrogation, to which the victim, oftentimes entirely unconsciously, responds by word or look or gesture, or perhaps by all three; and, at a later stage of the interview, these secret facts are artfully given back to the victim, who has no recollection of having previously imparted them, and will not believe that he has done so, but prefers to believe that he is in the presence of Divinity.

It is not only possible but easy for a practical adept to draw out in this way minute and elaborate details of secret family history. A few years ago, while connected with one of the public institutions of this city, I made a number of experiments in this line. I told the patients afflicted with various forms of nervous and allied disorders, not to tell me about their symptoms, nor give me any facts in their cases, but to let me tell them; and then I would proceed to indicate, after the manner of a clairvoyant, the locality of their maladies, and the history of their troubles. In the majority of cases I was successful, and made out the diagnosis to the satisfaction of those who sought my advice, and with good reason, for nothing that I could do prevented them from telling me, although I asked them no questions; unintentionally and unconsciously, they would guide me at every stage of the interview. By a little practice any one could easily acquire this art; and long study, such as professional clairvoyants bestow upon this subject, develops great skill in thus managing and deluding the unwary and non-expert.

THE July number of LIPPINCOTT'S MAGAZINE which opens the twenty-fourth volume, is of a thoroughly popular character, and the variety and beauty of the illustrations, as well as the excellence and vivacity of the reading matter, show the steady advance which has marked the course of this periodical. The opening article, by Dr. Felix L. Oswald, is the first of a series entitled Summerland Sketches; or, Rambles in the Backwoods of Mexico and Central America.

The second article has for its subject Stratford-on-the-Sound, a village of Connecticut. An article on Jefferson and Rip Van Winkle,—At and After the Play is written by an intimate friend of the great actor, Mr. L. Clarke Davis, who has gathered from his own lips the chief material for this biography. The illustrations, besides exhibiting Rip in each act of the play, include a portrait of Jefferson seated in his studio, and views of his beautiful country-seat among the hills of the Passaic.

The name of Thomas Hughes, author of Tom Brown's School-days, must always command attention, and the article by him in this number of Lippincott's will have a particular interest for American readers, being an able defence of Franklin against the animadversions and prejudices still current in England. A Swiss Patrician, by Arthur Venner, is the title of a very entertaining paper on Bonstetten, in his youth the friend of Voltaire, in his old age of Madame de Staël. Not less readable and vivid is the fifth chapter of Miss Porter's description of life in a Southern village; while the three chapters of Miss Olney's serial, Through Winding Ways, lead up to a dramatic climax, which indicates that the end of the novel will be full of incident and striking situations.

Women's Husbands is also continued with no falling off in piquancy and interest. Susan M. Day has a pathetic short story called Telescopic Discoveries, and the Monthly Gossip, is full of sparkling matter, including a description of Society in Paris during the Last Season, which is from the pen of a fair *comtesse* holding a high position in exclusive circles.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

YEARS AGO.

She was seated close beside me,
On a May day, years ago;
Heart of mine, you must not chide me,
I was but a boy, you know.

'Tis no secret, I'll reveal it,
Heart of mine, 'twas long ago;
This lock of hair, if I did steal it,
I was but a boy, you know.

Was she pretty? Did I love her?
Heart of mine, 'twas years ago;
And that pang of bliss is over,
I was but a boy, you know.

"Was she rich?"—now that is funny,"
Heart of mine, 'twas long ago;
What cared I for lands or money?
I was but a boy, you know.

"And you parted—how you missed her"—
Heart of mine, 'twas years ago;
And you pressed her hand and kissed her,"
I was but a boy, you know.

Do I love her yet?—O olden,
Precious past, thou heart of mine:
See, this lock of hair is golden,
And the head that wore it—thine.

[*Picayune.*

THE WOMAN'S CLUB.

METHODS OF STUDY.

I have read with special interest the articles in the Women's Department of the Rural, encouraging and urging women, particularly farmers' wives and daughters, to give more attention to the cultivation of their minds and manners. I believe this is the one great thing needed to meet the restless longing which so many women feel for a higher purpose in life—to overcome the dissatisfaction felt with an endless routine of physical labor.

Is it not just this aim that will raise one above the mere drudge, and, as some one has said, "make one happy in oneself and in spite of oneself?" It is a fact, I fear, that most country ladies give very little attention even to the general intelligence of the day, and in many farming districts it is a matter of remark and wonder to find a really cultivated and intelligent lady. One reason for this, no doubt, is the amount of labor incumbent upon them; but another reason, quite as prominent, is a lack of interest in the matter. Any woman who feels an interest in knowing how a certain question is debated in Congress will take time to find out, even if it be by the omission of some extra fussing and scrubbing. A woman who becomes thoroughly interested in history will find time for its study, even if it be at the expense of an extra plaiting on her best dress.

Our excellent writer, Miss Harvey, tells us that a great deal is accomplished when a desire for broader culture is awakened. This is true; desire is, no doubt, the first moving cause, but unless a real interest speedily follows, we shall find it dreary work. Desire will be short-lived in most persons unless interest comes to its aid. Therefore it is important, in taking up a study, that one should begin so as to become thoroughly interested at the start.

Perhaps, as I confess that I am judging others somewhat by myself, I shall make my meaning clearer by giving an item of my own experience.

Early in life I had the laudable ambition and strong desire to become well versed in history. I supposed, to accomplish this, I must be perfectly methodical in my work—start out at the beginning, and come down through the ages, surely, even if slowly.

I can now say that slowly was the only modifier needed, for I surely never reached farther than an uncertain distance in the 1st vol. of Rollin's Ancient History. I am sure that I tried faithfully, but other duties looked more important, and the volume disappeared for long intervals and was drawn from its resting place always with a sigh. You can imagine the progress made under such circumstances. Probably I should at present still have been plodding in that first volume of Rollin's, or else have given up in despair, had I not been rescued by a friend who often laughed at my persistency and slow progress. This friend advised me to leave Rollin, and gave me instead "Yonge's Life of Marie Antoinette," a book as fascinating and exciting as a novel. It was strange how much more time I found for reading! This was the real beginning of my study of history, notwithstanding the years I had struggled with that first volume of Rollin's, and I believe it to be as good a beginning as any one can make. One cannot read of the intensely interesting events of the French Revolution without being fairly drawn into a love of history. What preceding influences could have brought about such a state of affairs? How was the terrible work of La Guillotine finally stopped? Through what succession of events did the French nation become what it now is? One cannot stop reading until they find out.

Meanwhile through the connection of France with other nations the field of interest widens until there is really no stopping place. But to return to Yonge I soon found that this historian wrote with the pen of a royalist and judged actions from a royalist's standpoint. His characterizing of La Fayette, whose name all Americans are taught to reverence, as awkward, ill-favored and treacherous set me to searching Abbott and other historians for their views concerning him. These, while they did not differ from Yonge in point of fact, attributed different motives to the same actions, and thus set my heart at rest with the conclusion that La Fayette was still worthy of our honor and that no thorough royalist could appreciate the feelings and motives of a thorough republican. However, it was not my intention to criticise Yonge, but simply to show how my interest grew and how I progressed when once rightly started. As a history of the events leading up to the Revolution I found Miss Pardeau's Louis XIV. most entertaining and instructive. Dickens's "Tale of Two Cities" completed the topics for that time, nor would it have been complete without this last. I could never have appreciated so fully the oppression and injustice which preceded the Revolution had I never read Dr. Manette's story, nor could I have realized the horrors which followed had I not gone into the midst of them with sweet Lucie Evremonds. So from my own experience I conclude that it is far better to read history by topic than by course, that it is well to read, if possible two authors upon the same topic, who look at matters from different standpoints—that poetry, biography, or a good novel, read in connection with the topic will give a vivid and familiar idea of people and circumstances. Also, that in taking up a study by oneself it is better to start out in the most interesting part. Much more will be accomplished in this way even if obliged to study backwards.

Dry facts and dates make a slow beginning, but fill in very easily and pleasantly when one has become really interested in the subject connected with them.

May August.

IGNORANT MOTHERS.

I want to congratulate the Club on the subjects selected for discussion. I've heard it affirmed by members of the hostile sex that "women didn't have an idea above cook stoves and soothing syrups, and that were they once allowed an opportunity to express their opinions through the medium of a newspaper, they would take up the entire space allotted them in exchanging views on the subjects of pie-crust, panters, and teething."

Our Club is a standing refutation of this masculine libel on our sex.

There seems to be a tendency on our part to become "most awfully" literary. Clubite after clubite rushes to the front with "methods of study," and if every woman reader of the Rural isn't duly impressed with the idea that knowledge is not only to be coveted, but to be striven for, it isn't the fault of these enthusiastic writers.

Margaret B. Harvey and M. A. B. have said some timely and just words for the sons and daughters of illiterate parents. From time immemorial the child who is ashamed of his ignorant, ill-bred parent, has been held up to the scorn and contempt of the world. The parent's self-denial, the privations she has undergone to give the child educational advantages, have been expatiated on at length, and we are called on to despise the unnatural monster of a child who dares to wince at parental blunders in grammar and etiquette. I never remember to have read the child's side of the case, until the two writers, mentioned above, drew attention to the fact that there was something to be said in behalf of the child.

When we remember that the whole tendency of life at school is to develop a love for learning and a contempt for ignorance, is it to be wondered at that the scholar should despise want of knowledge even in his mother? A bright girl or boy soon learns to regard the ill-bred, ignorant, ill-dressed mother as a nurse, a cook, a seamstress, a housekeeper, and—nothing more. Such parents are loved quite likely, but respected they *cannot* be. Children may crucify their self-respect and introduce such a mother to their educated companions, and appear with her at social gatherings, but what should be a pleasure is a source of keen mortification to them.

The lesson which the average wife and mother has to learn is, that her first and chief duty is to herself, for neither husband nor children has she a right to sacrifice herself. This isn't at all orthodox I know, but it's a true gospel for all that. The slavery of the wife in many and many a home throughout this free (?) country is more pitiful, more hopeless and more degrading than ever was endured by the negro in the days gone by.

Sisters, will you not make an effort to be the queens of your household—queens by right of a grand, fully-rounded womanhood—or will you be content to be simply "the hewers of wood and the drawers of water" in the kingdom of home?

Jo Marsh.

CHILD-HELP IN THE HOME.

Somehow, I feel in the mood for writing to the Club this morning and giving my experience with children. I have six, so you will excuse me if I *do* think I know just a little about them. Mine are all learning to work, to sew and to care for flowers or vegetables. They help me in my washing, ironing, mending, making, and in the general housework, and some in the baking.

I have three girls, one almost 14 and the other two are 12; the three take turns in the work, one helps about breakfast, sets the table, washes the dishes, etc., and a second one gets the dinner and takes her turn at dish-washing; then when tea-time comes, the third has her part of the work to perform. Sabbath day we have but two meals and that breaks up the order of work just enough so that one does not have to get the meal next week at the same time of day. That is, the one who gets breakfast Sabbath morning will have the dinner to get on all the other days of the week. I find it saves quarreling and equalizes the work. Of course, I have to superintend and suggest here and there, while I try to do something in some other way to help the work along. In the morning two smaller ones claim my attention, at noon I have the dinner to prepare when the children are at school. I arranged matters in this way at first, because we could not keep a girl on account of the extra expense, and I wanted time to rest and time for study, and beside, I was anxious that my children should know how to take care of themselves. They were willing pupils. It requires much patience and perseverance, but it pays well in the end. I believe that the children are happier, and they are certainly less trouble. In washing they began by washing some particular thing of their own that they felt anxious should look well, now they do more than their own washing and more than their own ironing. They can iron tucks, ruffles, puffs, and embroidery nicely and they are very careful about soiling their garments since they do their own washing. They have plenty of time to play, study, cut and make many small things of their own, and what belongs to their dolls, *all* by hand too! When they have learned to do all kinds of hand sewing, then there will be time enough to learn to do machine work. Teaching them to keep their hose in order has been the hardest trial to me of any, but now they take pride in mending their stockings nicely, so I have my reward. I taught them to sew before they were three years old. Children learn more readily when young and the habit once formed is never forgotten; they find so much amusement too, in sewing for their dolls. Try it, some of you overworked mothers with your small children, and report.

Maria.

LEAF FROM AN INVALID'S DIARY.

June 23, 1876.—One of those rarely brilliant mornings which I notice only two or three times in a year. Our homely front yard is enchanted ground. The young grass has a peculiar soft luster, which is lightened by the deep shadows picturesquely playing over it—ever folding, reaching, receding, like waves on a sea. Over all this the luxuriant leafage gives the effect of spaciousness, as if I were in some castle garden extending far and wide, and the edifice behind me were an ivy-grown stone building instead of a common country farm-house. The inclosure at one side, surrounded by rail-fence and over-shadowed by maples, becomes a beautiful park, in which the fawn-like little Jerseys are really young deer.

I linger under the fascinating spell. I seem to be enveloped by the witching beauty of the soft-shining, shadowy greenness, and dissolved in it. I am in Paradise, and the vision is too strong for my weak, mortal eyes; but as I turn away, the vision changes. It does not fade, but grows in splendor. As the sun mounts higher, the shadows steal away into themselves, the stretched-out limits shrink to less than their accustomed size, but the great world beyond grows broad and bright and beautiful. Not a cloud flecks the blue above. Air and sun and sky conspire to make a perfect day—one of those rarest, most brilliant days when a sheen overspreads everything. Fairy Land is dull in comparison. Even the men and the horses seem to walk on air, and the birds are hushed by the wonderful beauty. Every breath is an incense, and the language of the earth seems to be that of the Canticle:

"O, all ye fowls of the air, bless ye the Lord; praise Him and magnify forever.

"O, all ye beasts and cattle, bless ye the Lord; praise Him and magnify forever.

"O, all ye children of men, praise ye the Lord praise Him and magnify forever."

I feel grateful that I am an invalid, and so am privileged to stay out in this magical world, and I have a real commiseration for the sweet sisters who must work in-doors, though I know they pity me with better reason.

Then I become conscious of my own immediate surroundings; they do not match the magnificence of the day, and the incongruity gives a sense of degradation. I go in, feeling like the little girl who said: "Mamma, let me put on my white dress, it is such a shiny day." But my room is a dungeon. I can see nothing clearly. My eyes are blinded, and I soon escape back to the brightness, determined that this day, at least, shall be "a joy forever."

Zena Claybourne.

WOMAN'S SUNDAY WORK.

How true a picture of the lives of a majority of women, Bertha A. Winkler, portrayed in the last Rural when writing of "Sunday Rest for Women." I have frequently heard mothers say that Sunday was the most tiresome day in the whole week to them. In the main the fault lies with themselves; they have taken upon themselves this unnecessary burden and their husbands simply allow it and in fact never think much about it. I have very little sympathy for a woman with health and strength enough to attend church and Sabbath-school, who will remain at home to cook an extra dinner for company that may possibly come home with the husband, sons or daughters. Why will women suffer themselves to become such slaves to their families, and—to pride?

Our thoughtful young housekeepers of the Rural band may take a lesson to themselves, and by lessening their labors on Sunday be able to spend that day (as our Heavenly Father intended they should) as a day of sacred rest. I would not deprive myself of the holy Sabbath privileges, even though I had to set a plain cold dinner before my family and friends. When I wish to display my domestic skill I take some other day in the week, when I can do so with a clear conscience.

Late rising on Sunday mornings is a frequent cause of a mother's extra labors on that day; for the children must make haste to Sunday-school, and the morning work is left for mother's tired hands. At my father's house we were taught to rise as early on Sunday mornings as on any day in the week, and as preparations were always made on Saturday the labor of getting the Sunday meals was but slight. When old age comes the mother who has denied herself that rest, which is necessary to her health and well being, will not be any more respected or beloved by her family, than the one who attends church with her husband and children or otherwise takes her natural rest free from any extra care.

Mrs. Lou J. Abbott.

Faith Ripley—Some time ago I sent a request to the lady readers of the Rural, for a recipe for washing flannels, without shrinking. Not receiving the desired information as yet, I will send you the recipe that I have since received from a reliable source:

It is very essential to avoid hard water and resinous soaps. Wring without twisting (with a wringer) or not at all. Use water of the same temperature all through, or increase the heat, during the changes. Do not rub the soap upon the flannel, but mix it with the water. Flannel is of so porous a texture that it is easily cleaned in good suds without much rubbing. Hard rubbing tends to "full" the cloth, and to rinse in cold water flannel that has been washed in warm water is a sure way to shrink and harden it. From cold to warm, but never from warm to cold. One or two suds may be used, according to the degree to which the flannels have been soiled. When they have been rinsed, two persons should take blankets, one at each end, shake, and snap them well, to make them more soft and fuzzy. A good way to wash flannels is to soak them awhile in ammonia and soft warm water, before washing. To wash clouds—stretch them upon a board, fasten at the corners, then wash them with a brush with warm, soapy water; rinse with warm water.

Yours, Respectfully, Marian.

CORRESPONDENTS' CORNER.

This poem is sent in response to a request which appeared in "Correspondents' Corner," June 7th.

"OF ALL THE BONNY BUDS THAT BLOW."

Of all the bonny buds that blow
In bright and cloudy weather,
Of all the flowers that come and go
The whole twelve months together,
This little purple pansy brings
Thoughts of the sweetest, saddest things.

I had a little lover once,
Who used to bring me posies;
His eyes were blue as hyacinths,
His lips were red as roses;
And everybody loved to praise
His winning looks and winsome ways.

The girls who went to school with me
Made little jealous speeches
Because he brought me, loyally,
His biggest plums and peaches,
And ever at the door would wait
To carry home my books and slate.

They "couldn't see," with pout and fling,
"The mighty fascination
About that little snub-nosed thing
To win such admiration;
As if there weren't a dozen girls
With brighter eyes and longer curls."

And this I knew as well as they,
And never could see clearly
Why more than Marion or May,
I should be loved so dearly:
And so I asked him how was this;
He only answered with a kiss.

But still I teazed him, "Tell me why
I want to know the reason."
When from a garden bed close by
(The pansies were in season)
He plucked and gave a flower to me
With sweet and simple gravity.

"The garden is in bloom," he said,
"With lilies pale and slender,
With roses and verbenas red,
And fuchsia's purple splendor;
But over and above the rest,
This little heartsease suits me best."

"Am I your little heartsease, then?"
I asked with glowing pleasure;
He answered "Yes," and "Yes," again,
"Heartsease and dearest treasure;"
That the round world and all the sea,
Held nothing half so sweet as me.

I listened with a strange delight,
Too rare for words to capture;
Nor ever dreamed what sudden blight
Would come to chill my rapture:
Could I forsee the tender bloom
Of pansies round a little tomb?

Life holds some stern experience,
As most of us discover;
And I've had other losses since
I lost my little lover:
Yet still this purple pansy brings
Thoughts of the sweetest, saddest things.

[*Thomas Fulton, New York City.*

To the same correspondent I would say that "When Greek *joins* Greek then comes the tug of war," is the proper rendering of the quotation.

T. F.

Adverb vs. Adjective.

I am in favor of preserving the English language in its purity, though from early association with those who habitually murdered it, I am unable always to use the right word in the right place. I have as intense a horror of the hypercritical as anybody, and dislike to appear in the character of critic; yet I see occasions when I feel justified in doing so. The use of the adverb in the place of the adjective in such expressions as "Oats look badly," "Corn is looking well," "Wheat has looked splendidly," etc., etc., are all violations of good usage and grammar, which it behooves those who write for the public eye to discourage and denounce. I am aware that the habit of saying "looking well" when we mean "looking good" has become almost universal, but that does not make it correct. It is probably too well established, however, to be uprooted, but that is no good reason why we should go on to establish other errors, however analagous they may be to that one. One wrong does not justify another. It may be an argument in favor of the use of "well" as an adjective that the people have compelled the dictionary-makers to recognize it as such. I recollect hearing a prating pedagogue, in my youth, criticising an expression of Irving's: "Everything looked smiling about us as we embarked." He said "smiling" should be "smilingly." It is evident that schoolmasters of that type have been abroad quite too much of late. The masses of the people are always ready to defend errors and false doctrines which have become habitual with them. A thousand will array themselves on the side of habitual error where one will stand up for the abstract truth in language or science.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

LOG-CABIN SKETCHES; OR, JESSIE SEABRIGHT'S DIARY.—No. 7.

MAY MAPLE.

"Be it ever so humble, there's no place like home."

June 7th, 1879.—How forcibly these words struck me as I sauntered up the walk, leading my little boy, and closely viewing the thrifty plants my own hands tended with the most vigilant care. As my eye rested upon the little cabin, set down, as it were, in the midst of a green plain, with the dim old forest and its wealth of glossy leaves and tassel-like blossoms for a background, I could not help thinking that, taken as a whole, the scene was a bit of rural loveliness worthy of an artist's pencil.

Stepping into the cabin through the wide-open door, and surveying the room with a critical eye, I was sure I need not be ashamed of my humble home, even though the President and his lady wife should chance to call at my door. Since the last jottings in my journal, I had hung up some pretty engravings and a couple of handsomely-tinted chromos. The latter had been handsomely framed by one of our neighbors, who was a "jack-at-all-trades" with a large family, and more ambition to whittle and "potter about" than to labor. I had tried to make some cone frames with pasteboard for a foundation, and failed in the attempt; for the cones and shells were constantly falling off. But the jack-knife frames were made of bits of cherry wood, and, when oiled and varnished, were as pretty as need be, and far more satisfactory than any cone ones I could ever make. In payment for these I made the little girls some dresses. The engravings were small—one a bit of mountain scenery. This I surrounded with an evergreen, which we call "Traveler's Joy." I never learned its botanical name. It grows in the form of a miniature tree, from six inches to a foot in hight, near swamps and damp places, and is much sought after in some rural districts for decorative purposes. I also made a cross of bits of cedar wood, and covered it with the same evergreen. This I hung over the corner what-not.

A portrait of Dickens was framed with a handsome wreath of immortelles, given me by friends. Some large fungi, found on old hemlock and beech logs, when varnished, made handsome shell-like brackets for bouquets. The vases were wide-mouthed bottles or, more frequently, beheaded bottles, set in odd-shaped boxes of my own manufacture. These, when filled with sweet-scented wild flowers, that were kept fresh by an abundance of spring water, showed no jagged edges, and together added wonderfully to the cheery appearance of the room.

"I know what I fink," said Bertie, as he settled himself comfortably in his little "resting chair."

"Well, what do you think?" said I.

"I finks we have the p'ettiest home of any body. Mama, why don't Mr. Brown's folks have fings too?"

I didn't tell the little boy that Mrs. Brown had neither energy nor perseverance; or that she had rather sit down beside dingy walls to read sensational stories or gossip with some neighbor, than to spend time and strength in "fixing up" her house, and making it attractive. Yet I knew this to be the case. And I did not so much wonder that the Browns were always so anxious to "sell out," and go where they could see something new to talk about. Those who are so unwilling to exert themselves are very seldom content with their lot; and yet they invariably envy the neighbor who "has the knack" of "fixing up," and of making the best of everything.

TO SKELETONIZE LEAVES.

Select well-grown leaves, and examine carefully to see if they be perfect before soaking. Put into an earthenware dish or wooden tub, keep covered with rain-water and stand in the sun. In from two to three weeks' time the skin and fleshy part—epidermis and parenchyma—will be found to be pulpy and decayed. Provide yourself with some cards as large, or larger, than any of the leaves, a soft camel's-hair brush, as well as one a little stiffer. Gently float a leaf onto a card, and with the soft brush carefully remove the skin on one side. Have ready a pan of clear water, reverse the card in the water and slip it under the leaf so that the other side is uppermost. Brush this to remove the skin, when most of the parenchyma, or fleshy part will come with it, but if not it may generally be washed out in the water. If the soft brush fails to remove all the green particles adhering to the framework, the hard brush may be used, but with great care. Any brushing action or horizontal motion will surely break the veins, and the use of the stiff brush can only be successful in a perpendicular direction—a sort of gentle tapping—to loosen the tissue so that it may be washed out with the soft brush. Holly leaves make beautiful skeletons, but they should be soaked in a dish by themselves, as their spines are apt to damage the more delicate leaves.

TO BLEACH.

Prepare a weak solution of chloride of lime—dissolve one-half pound in three pints of rain-water, strain, and use one part of solution to one of water—put into a basin in which the skeletons may be put by floating them off the cards. We have found it best to prepare and bleach about half a dozen at a time. They require watching, and if allowed to remain in the solution too long will fall in pieces—from one to three hours will generally suffice. By aid of the cards, wash in two or three clear waters, and finally leave in clean water half an hour. Then take up on the cards or pieces of paper; arrange the skeletons as flat and natural as possible with the assistance of the soft brush, and before they are quite dry remove from the paper and place in a book or botanical press.

The unskilled novice will not be apt to be successful in her first attempt to skeletonize, for it is a tedious operation, and requires care and great patience to obtain satisfactory results. We have found the holly, English ivy, grape, rose and pear among those easiest to skeletonize, and we recommend the beginner to try them. Gather the latter part of June, or as soon as the leaves are fully developed.

REMEDY FOR A COUGH.

A friend tells us that a mixture of equal parts of Jamaica rum, honey and linseed oil, taken three times a day, a spoonful each time, is a most excellent medicine for a cough. In her own case, where the cough was brought on by an attack of pneumonia, she was entirely cured by its use.

DOMESTIC RECIPES.

Steamed Pudding.

Put two tablespoonfuls of sour cream into a pint basin; then fill up with rich buttermilk; add a little salt, a teaspoonful of salaratus, and flour to mix soft; roll out and spread with the preserves left from yesterday's tea. Place in a buttered tin and steam one hour and a half. Eat with a sauce of butter, sugar and boiling water, thickened with corn-starch and flavored with nutmeg.

To Clean Zinc.

Scour with sifted coal ashes; afterward rub with kerosine. Kerosine also gives a new look to oilcloths.

Sickness.

When going to sit up with a sick neighbor, take your night lunch with you, that you may not make any more trouble for the already tired and overworked family. In many cases I have found that it would ease the patient to bath in strong vinegar with a little warm water and then wrap in soft flannel. Put the lights out of the room, and, if possible, lie down yourself on a couch; it may induce sleep to the sufferer. Mrs. C. F. Reynolds.

Strawberry Blanc-Mange.

Stew nice, ripe strawberries, strain off the juice and sweeten to taste; place over the fire, and when it boils stir in corn-starch wet with cold water—two tablespoonfuls of corn-starch for each pint of juice; stir until sufficiently cooked; pour into molds wet in cold water and set aside to cool. To be eaten when very cold with cream and sugar. Raspberries may be substituted for the strawberries, although the blanc-mange does not look as nicely.

Mrs. Florister.

Ripe Currant Pie.

Line a pie-tin with a good crust and fill with a mixture of one cup of crushed ripe currants, one of sugar, two spoonfuls of water, one of flour mixed smooth with the beaten yolks of two eggs; bake; then cover with a merangue made of the whipped whites, and two tablespoonfuls of powdered sugar; return to the oven to brown. Housewife.

Bean Salad.

String young beans, cut into small pieces, wash and cook tender in salted water, drain well and add so much finely chopped onion as liked, with pepper, salt and vinegar. Serve when cold, and add a little olive oil or melted butter.

Potato Salad.

Chop cold boiled potatoes very fine; add enough minced raw onion to season, and pour over a good salad dressing. M. L.

QUESTIONS ANSWERED.

Chow-Chow, Stiffening and Ironing Silk.

C. J. H., asks for a recipe for making chow-chow; also how to iron a silk which has been colored, so as to give it a little gloss and stiffness.

Ans.—1. The best recipe for chow-chow that we have ever tried was given by Mrs. Beekman in the Rural of August 17th, 1878, which we will again publish. It is as follows: One peck of green tomatoes chopped fine; sprinkle one cup of salt over them and let stand over night; in the morning drain in a colander, add eight green peppers chopped fine, one cup of white sugar, cover with vinegar and boil twenty minutes. Chop fine six large onions; two bunches—the white part—of celery, with three or four red peppers. Add to the other ingredients, when cool and drained, a cup of mixed mustard, whatever spice you like and a pint of grated horse-radish. Put into a stone jar, cover with cold vinegar and tie down tightly.

2. Dilute ammonia with alcohol, sponge on the right side and iron at once on the wrong. Or, cut into shreds an old kid glove, as near the color of your silk as possible; pour over a pint of water and boil until reduced to half the quantity; strain, add a tablespoonful of alcohol and sponge and iron as above. Sponging with flax-seed water will also give a gloss and stiffness to an old silk.

News of the Week.

MISCELLANEOUS.

Monday, June 30, 1879.

The prospect of the appearance of philanthropic Northern steamers on the Mississippi to carry colored people away to Kansas has so alarmed the planters, that a convention of those of Washington Co., Miss., has drawn up an address to Northern "business men and benevolent societies," protesting against their lending countenance to any such scheme, on the ground that, though the negroes were not badly treated in Mississippi, their imaginations would be so fired by the proposal to carry them to "fresh woods and pastures new" that even the well-to-do would abandon their homes, and utterly disorganize the industry of the State. There is doubtless a great deal of truth in all this; but the sober and sensible and conservative planters who sign addresses of this kind ought to know that a little personal activity on their part in putting down lawlessness in the State would, in a very few years, make it as absurd to send steamboats to carry off its laborers as to send them up the Hudson River for a similar purpose. The negro is such excellent material for electioneering purposes at the North that Southerners need have little hope of taking him out of politics until they police themselves better. The movement which these Mississippi planters dread is the one promoted by General T. B. Conway, who is collecting subscriptions to enable him to take a steamer down the Mississippi to carry off intending emigrants, whom he is going to deposit in Wisconsin, General Butler having promised him 17,000 acres of land for the purpose; and he has, he says, agents in half a dozen States engaging employment for colored emigrants among the farmers. We sincerely trust, however, that none but the really destitute will avail themselves of General Conway's munificent offers. We are quite sure that a negro who owns anything will be better off in his own home than on General Conway's boat or General Butler's land-grant. It is a curious fact that at the meeting held in aid of the Conway movement in this city a couple of weeks ago the only person who spoke of war and seemed to be prepared for battle was a clergyman—the Rev. Dr. Newman. He assumed that the use of the Mississippi as "a highway" by the Conway boat would be resisted by force, announced, amid thunders of applause, that in that case "the people of the North would make it a highway." In fact, within a few weeks an extraordinary number of ministers have been heard sharpening their swords.

One of the heaviest "strikes" that have ever occurred in this country is now under way in Fall River, R. I. It is said to be mainly promoted by foreign labor agitators, and it promises enforced idleness for many weeks to 12,000 or 15,000 men, women and children, and the suspension of production amounting, in the case of 30 print-cloth mills, to 149,500 pieces weekly. All these strikes are, of course, in reality an attempt to manage very complicated business enterprises through universal suffrage; and the history of the co-operative movement in England seems to make it certain that in the existing state of human nature they cannot succeed. Official reports to the agent of the Western Associated Press at Memphis, Tenn., from the mayors and presidents of boards of health of Memphis, Vicksburg, Jackson, Miss., Canton, Miss., Shreveport, La., Collierville, Tenn., Hickman, Ky., Grenada, Miss., Helena, Ark., Holly Springs, Miss., Decatur, Ala., and Tuscumbia, Ala., all bearing the date June 20, state that the health outlook has never been more favorable. In no instance has there been any indication of a return of yellow fever. A return made by the Secretary of the Treasury shows that the exports of live cattle from this country have increased from 733,395 in 1868 to 5,841,653 in 1878, or nearly eight-fold. One-half the exports are to England. A Bohemian Sunday-school picnic at Chicago last Sunday week was disturbed by outside roughs, when a company of Bohemian sharpshooters recklessly fired into the rabble, wounding seven men and killing one. A number of the rifle-men have been arrested and held for murder.

The June report of the Department of Agriculture confirms the conclusions from our crop reports except a few slight cases, in which we are strongly disposed to prefer our own reports. According to it the average of oats has decreased about 4 per cent. The general average of acreage and quality is 81, against 103 last year. The condition is unfavorable in nearly all sections of the Union. The decrease in the acreage of rye is about 3 per cent. New England is full. New York only 80 and Pennsylvania 88. Barley is low, the general average being 85 while in 1878 it was 102. Corn is backward. Owing to drought in many localities the seed did not germinate. The condition of clover is very low all over the country, except in New England and the States bordering on the Gulf of Mexico. The prospect for a good crop of fruit is gloomy, the late frosts being fatal in many regions. There will be a short crop of apples, the average being low except in New England. The crop in the Atlantic States is fair. In the Gulf States the yield will be only half a full crop. Peaches suffered most from the frosts of May. In the Eastern States, and particularly in those where the culture is a specialty, the crop is represented as good, but in the Atlantic States south of Virginia it is a failure, and that is the case in the States bordering on the Ohio river, except a few localities.

The following reports from the southern cotton exchanges show the condition in which the cotton crop was 31: In Mississippi and Louisiana, acreage about as last year: crop generally good; but few hands gone to Kansas and the exodus fever nearly subsided; crop in Louisiana one or two weeks later, but in some parts of Mississippi as far advanced as last year; labor good. In Alabama there is an increased acreage of 1½ to four per cent; labor excellent; crop in some portions earlier than last year. In Arkansas there is a 2½ per cent increase of acreage; stands good; crop in some parts earlier, in others later, averaging about as last year; no loss of labor by the Kansas movement. Georgia reports three per cent increase of acreage; stands good; labor abundant; the plant small and somewhat retarded by the cool nights and heavy rains, but the weather now dry and warm; no loss of labor. In Florida the increase of acreage is two per cent; stands good; labor about as last year; crop two weeks later; the Sea Islands report a five per cent increase of acreage. The crop in North Carolina and Virginia is generally good, and the planting about the same as last year. In South Carolina a five per cent increase of acreage is reported; crop 10 days to three weeks later than last year, except in a few portions of the state, where it is earlier; labor good in half the districts, scarce in the rest.

Congress is very anxious to enjoy junketting tours at the public expense. Twelve sub-committees composed entirely or in part of Senators, and including in their membership about three-fourths of the entire body, have already been empowered to sit during the summer vacation. The majority of these committees are armed with authority to travel to distant parts accompanied by deputy sergeants-at-arms and other attendants, while their traveling expenses are to be provided for from the contingent fund of the senate. Although the House is a trifle more modest, in view of its larger membership, yet there, too, there is a large number of fortunate souls, who will be able to enjoy the summer months pleasantly at the public expense in making trips throughout the country, nominally in behalf of Uncle Sam's welfare, but really for their own enjoyment.

Judge Christian, of Virginia, has discussed the matter of summoning negroes on juries, in reply to a petition of some colored men, in a way which shows that the Civil Rights Act cannot really be used to give negroes a right to be summoned without some serious straining of the law. To summon a man because he is a negro Judge Christian has no difficulty in showing is just as much a violation of the law as to leave a man out because he is a negro, or to summon him because he is white. He says he summons men not because they are either white or black, but because they are qualified, and it would be hard to prove the contrary. Judge Rives, who caused five county judges to be indicted for not summoning negroes on juries, laid it down that this plea might be met by the presumption that where a judge habitually abstained from putting negroes on the panel he did so on account of race and color, and in violation of the act. But this, again, might be upset by showing that the negroes of a particular county supplied no men of sufficient intelligence and capacity. In fact, if the object of the act was to put negroes on juries, it is, as fatally defective in not directing the summoning of negroes on every State jury. Whether if it did so it would stand the Constitutional test, is another question.

The President has vetoed the Judicial Appropriation Bill on the ground that in forbidding any department or officer of the Government to incur any liability for the payment of general or special deputy-marshals "for service in connection with elections," and in making no appropriation for the payment of such officers, it deprives him of the means of executing laws now on the statute book and which it is his constitutional duty to execute, and the execution of which can be called for by any two citizens of any city or town having over twenty thousand inhabitants. The object of the majority in inserting this provision in the bill is to prevent the operation of laws which they are unable to repeal, but he points out with great force that there are only two lawful ways of overturning legislative enactments: "One is their repeal; the other is the decision of a competent tribunal against their validity." Neither of these being within the reach of the majority, there is something perverse in attempting to accomplish their object by reducing the Executive to helplessness in the presence of a duty of which they acknowledge they cannot relieve him. It must be said, however, that the veto would have more weight if there was any possibility of the President being called on to perform this duty before Congress meets again in December. As there is not, it must be treated as simply a contribution to the controversy now raging over the powers of the General Government in the regulation of Federal elections.

A few days since exciting rumors of cattle disease on the Divide, thirty miles south of Denver, Col., were current, and a long sensational telegram to a paper in this city depicted, in exaggerated style, the vast ravages of the malady, which was reported to be highly contagious. Investigation, however, goes to prove that there was needless alarm, no new cases being reported for ten days. Timely precautions have been taken, and

the President of the Colorado Cattle Growers' Association states that the infection is confined to a few small herds, and has not extended to the plains. The round-ups are nearly through. Cattle are reported in good condition generally, with less losses than formerly, and with a greater increase in calves than in average years.

FOREIGN.

Some weeks ago it was here mentioned that that old reprobate, the Khedive, had summarily dismissed the foreign members of his Cabinet, who were endeavoring to so manage the financial affairs of the country as to pay at least a part of the interest on the vast load of debt which the luxurious ruler's extravagance had piled upon the people. Well, since then France and England have been pressing hard upon the degenerate successor of the Pharaohs to force him, at first, to reinstate the deposed officials, then, to accept others in their stead, and finally, on the failure of these efforts, through the old fellow's pig-headed obstinacy, to compel him to resign. Lately the French consul at Cairo officially demanded that he should abdicate in favor either of his brother or son, and his demand was supported by most of the other foreign representatives. The Khedive promptly refused to give up power and opportunities for swindling his foreign creditors and oppressing his own subjects, and blustered a good deal about going to war if an attempt should be made to depose him. The Powers then appealed to the Sultan to force his obstinate dependent to comply with the demands of his creditors. The other day the Sultan issued a decree deposing the Khedive and nominating his son, Tewfik Pasha, as his successor. The old man will have a comfortable pension of £50,000, or about $250,000 a year, on which, with a moderate degree of economy, he should be able to live pretty well. He has been ordered to quit Egypt, and, refused permission to go to Constantinople, is said to be about to visit Smyrna temporarily, and then go to Paris, where he will reside permanently.

The troubles in Eastern Roumelia, now that the Sultan has agreed not to occupy the Balkans, have dwindled down to the question of what kind of head-coverings the new governor, Aleko Pasha, is to wear. The Sultan, who clings all the more tenaciously to the signs of power as the substance of it is vanishing, insisted on his wearing the fez, a red cap which has for forty years been the official head-dress of the Turkish Empire, to show that he was a Turkish officer. The Bulgarians, on the other hand, wished him to wear the "stove-pipe" hat of the western world, to show that he was not a pascha of the old type. Aleko himself appears to be a thorough Bulgarian at heart, and determined to administer the province for its own benefit, so he has adopted a compromise, suggested, it is said by the Russians, by wearing the Bulgarian calpak, or fur cap of the peasantry.

Once more there are numerous reports that the war in South Africa is drawing to a close. Cetawayo has again sent in envoys to ask on what terms his surrender would be accepted. He has been told that he must disband his army, not assemble it again for five years, pay two beeves for every male subject, make over a large number of these to his disloyal chiefs who have already submitted to the British and resign a strip of his territory. It is confidently expected that he will accept the terms. Never in any land has a band of naked savages opposed such an always vigorous and often successful opposition to the invaders of their country, as have the Zulus. The resistance of the ancient Britons against Cæsar's legions was nothing to it. The Zulus have shown themselves braver and more skillful than the Britons though certainly, hardly more civilized, while the English army opposed to them, is proportionately more numerous, and infinitely more powerful than Cæsar's. Indeed it would have found much less difficulty in destroying the Roman legions than it has met with in saving itself from the Africans. The death of the French Prince Imperial, in the late skirmish will make this war historical, even if no other thing connected with it would have so distinguished it. But the army held in check now by Cetawayo is greater than the British army that defeated Napoleon at Waterloo or than that which won the battle of the Alma, in the Crimea, and nearly double the size of that which has lately brought the Afghan war to a triumphant termination.

The American consul at Lyons, France, confirms the former reports of the failure of the silk crop in France, Italy and Spain. The excitement of the speculation in silk is extreme in Lyons, Milan and and other silk markets. Notwithstanding these great failures in the silk harvest, the consul is of the opinion that in the world at large the demand will not exceed the supply and that consequently present prices cannot be sustained. The gathering of the Cuba sugar crop is completed. The product will be 115,000 tons greater than last year's crop, notwithstanding the enormous loss of cane by fire. £35,000,000 is a great deal of money. So much lies in bullion in the Bank of England. The London Times says it is the largest amount ever recorded there. In all of the money centers capital is in excessive supply. The growth of it is more rapid than the call for new uses. Business will revive and give fresh employment, but this exhibition and others like it in other cities, prove that the wages of money must fall. The increase of capital must lead to the same results as an excess in the supply of labor—to wit, lower rates. That means better returns for labor, and then a brisker demand for money; and thus the new equilibrium will be established.

Weston, the pedestrian who has been known to the public on both sides of the Atlantic for eighteen or nineteen years as a walker of long distances, has accomplished the feat of carrying off the Astley champion's belt, which Rowell took away from this city only a few weeks ago. The triumph is the more welcome because in these trials of endurance hitherto the duty of upholding the American fame has generally fallen into the hands either of pure-blooded Irishmen or American citizens of Irish parentage, thus preventing the contest from throwing any light on the much-debated question whether the stamina of the Anglo-Saxon race had undergone any diminution in this country. The interests of American pugilism are, in fact, attended to almost wholly by Irish gentlemen, and O'Leary, who brought the Astley belt to this country, and Ennis, who made such a gallant effort to prevent its being carried back by Rowell, were to all intents and purposes, Irishmen. Weston, however, is a genuine Yankee, born and bred in Rhode Island, and his making the best time on record—550 miles within six days—is a pure gain for the United States, and a consequent source of despondency to the United Kingdom, which on this occasion was represented by "Blower" Brown. But the London public, doubtless knowing what was coming, stayed away in a shabby manner from the spectacle, so that the profits on the gate-money only amount to $3,000, in contrast to the $19,000 or $20,000 carried off by Rowell from this city.

Our folks are "blowing" mightily about Hanlon's late victory over Elliott, England's champion oarsmen, but for this triumph we have even less cause for self-glorification than for the successes of our Irish-American athletes; for Hanlon is a Canadian who has whipped our best sculler.

VARIOUS.

Winterheim, a large Icelandic colony in western Minnesota, expects an addition of 300 from Iceland in August.

Senator Gordon's sheep ranch in Georgia comprises 40,000 acres. Negro convicts will enclose it with a stone wall, seven miles of which have been completed.

William A. Brewer, a lecturer on religion and temperance, married a woman of 70 at Ossipee, Mass., lived with her until he had got possession of her $700, and then ran away.

Mount Hood, Oregon, has lately been giving out volumes of smoke from a long extinct crater, where ordinarily a smell of sulphur and a slight warmth only indicate inward fire.

Dr. Spencer, a dentist at Platte City, Mo., was shot and killed by a man whose wife he had kissed while she was in his operating chair, partly under the influence of chloroform.

Packages warranted to contain the means of sure death for potato bugs, without poison, were sold at a fair in Illinois. Each contained two blocks of wood, on one of which was written, "Place the bug on this block and smash him with the other."

A terrific thunder storm passed over the central and northern part of Connecticut, from west to east, Sunday afternoon, and caused much damage to crops, corn especially being beaten down. Some trees and houses were struck by lightning, but no lives were lost. In Hartford the streets were deluged. It was the heaviest storm of the summer.

The Land Agents' Record states that the real estate sales in England, officially reported from January to April, 1877, were £3,166,065. For the period of 1878, £2,149,795; for the same period of 1879, £1,016,270. The decrease is attributed to the unwillingness of owners to sell at the low prices which prevail.

Five outlaws were hanged by a mob in Henry County, Ky., several years ago, and until lately that section was free of robbers. A new gang, however, has proved its existence by a particularly fiendish crime. Raiding on a farmer's premises at night, they murdered three persons and burned the buildings, for the sake of stealing things worth less than $500. Gov. McCreery says, in a proclamation offering a reward, that Kentucky cannot afford to let the criminals escape.

The failures of farmers are becoming alarmingly frequent in England. In 1870 they numbered 229; in 1875, 354; in 1876, 480; in 1877, 577; in 1878, 815, and in the first half of 1879, no fewer than 614. In addition, the facts are well known that farmers in many counties are now losing their capital, that landlords find great difficulty in reletting at any price, and that the remissions of rents have only met a portion of the difficulty. If the land of England becomes less and less able to compete with that of other countries in the growth of meat and cereal crops, the alteration in the conditions will have an effect not only on the persons immediately concerned, but on England as a whole.

As a general thing Ladies who make any pretentions to refinement desire to have *soft white hands*. We believe there is nothing will tend more to produce this effect than the constant use of MURRAY & LANMAN'S FLORIDA WATER mixed with the water in the basin. It removes redness and roughness. The ladies of Cuba and South America were the first to discover the extraordinary virtues of this floral water as a cosmetic and have long since discarded the use of all others.

$500 will be paid for any case that Hop Bitters will not cure or help. Doubt not.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, June 28th, 1879.

BEANS AND PEAS.—All varieties of beans, excepting black, are weaker to sell. Holders of extra well-kept qualities and a few standard marks decline to sell lower than at our last, but there is no demand of moment for either export or local use. Green peas steady, must be choice to bring $1.85; general rates, $1.75@$1.80; Southern B. E. have sold at $2.60 per 2 bush. bag. Canadian nominal at 75c., bulk and and bond. Marrow beans, prime, $1.35; fair to good, $1.25@1.32½; medium, prime, $1.30@1.32½; fair to good, $1.20@1.25; pea, $1.20@1.32½; white kidney, $1.25@1.40; do., red, $2.05@2.80; black, $2.25@2.30.

BROOM CORN.—There has been a steady demand and the stock in store has been gradually reduced. The tone is firm for all grades and slightly in sellers' favor.

Brush and short broom, choice, ₱ lb, 5½@6½c. do., common to good, 4½@5½c.; hurl, good to choice, 4@4½c.; do., common to fair, 3½@4c.; red and crooked, 2½@3½c.

BUTTER.—Supplies are lighter, but there is an abundance of good unsold stock, and the market continues to feel the weight of the previous heavy deliveries. In a word, there are more sellers at the inside rates than at the extremes. The outlook is for a cheap season; local consumption will fall off as the summer advances, and from present appearances shippers will not render the coveted aid in working down the surplus. The light exportation of the week is partly accounted for by the fact that cold room on the steamers has been scarce; and there has been very little done for foreign use during the past three days. State half tubs still turn out fine. The market and grocery trade is using State very freely in preference to Western, as at prices for either there is plenty of margin for retail profits.

State pails and half tubs, choice, 13½@14c.; good to prime, 12@13c.; fair to good, 10@12c.; firkins, choice yellow, 15c.; fair to good, 13@14c.; Welsh tubs, choice, 13@14c.; good to prime, 12@13c.; fair to good, 10@12c.; poor, 7@9c.; State creamery, best invoices, 16c.; good to prime, 15@15½c.; sweet cream, best, 15@15½c.; fair to good, 14@15c.; Western, best invoices, 15c.; good to prime, 13@13½c.; fair to good, 11@12c.; imitation creamery, 11@12c.; Western dairy, best invoices, 10@11c.; good to prime, 9½@10c.; fair to good, 8½@9½c.; poor to fair, 7½@8½c.; Western, factory, best invoices, 10c.; good to prime, 9@9½c.; fair to good, 8@9c.; poor to fair, 7@8c.; grease butter, 3½@4½c.

Receipts, for week, 42,743 pkgs.
Exports, 10,607 do.

CHEESE.—Low interior prices have given buyers here a position of dictation, and they have to be met, as the quality of general stock is such as must be suddenly disposed of.

State factory, full cream, fine colored, 6@6½c.; fine white, 6@6½c.; good to prime, 5@5½c.; fair to good, 4@5c.; half-skimmed, 3@4½c.; skimmed, 2@3c.; farm dairy, fine, 5½@6c. good to prime, 5@5½c.; fair to good, 3½@4½c.; skimmed, 2@2½c.; Western, factory, full cream, flat, fine, 5½@6c.; good to prime, 4½@5½c.; fair to good, 4@4½c.; half-skimmed, 3@4c.; skimmed, 1½@2½c.

Receipts for week, 96,545 boxes.
Exports, 91,000 do.
Liverpool cable, 35s@36s.
Steam, 35s.

DRIED FRUITS.—Market unimportant at this period of summer. All items more or less nominal.

Apples, Southern, sliced, 2½@3½c.; quarts, 2@2½c.; evaporated, fancy, in cases, 10@11c.; fair to good, 8@9c.; State, sliced, good to prime, 2½@3½c.; quarters, 2½@3½c.; Western, quarters, 2½@3½c.; quarters, 1877, 1½@1½c. Peaches, N. C., peeled, choice, 9@10c.; good to prime, 7½@8½c.; Georgia, peeled, choice, 8@9c.; peeled, fair to good, 6@7c.; peeled, pr. to fair, 5@6c.; unpeeled, halves, 3@3½c.; quarters, 3c. Plums, State, 1878, black, 8@10c. Blackberries, 1878, prime, 4½@5c.

Exports since June 1st, 21,844 bbls.; in '78, 8,311 do.

EGGS.—Receipts for week, 7,849 bbls.; do., last week, 9,078 do. Trade is extremely slack considering the small supplies and the easy range of prices; even best N. J. have declined. The weather has turned hot and unfavorable for carrying stock. Near points, 15c.; State and Penn., 13½c.; Canadian, 13½@14c.; Western, choice, 12@12½c.; poor, 11c.

FRESH FRUITS.—The list has become quite varied during the week. The weather is warm and most items have to be pushed for a quick sale. Early Hawes apples, Southern, ₱ bbl., $2.50@$3; common green, 50c.@$1.50. Strawberries are almost over; Oswego, crates, 9c.@13c. qt.; Oneida, 7c.@10c.; choice up-river, 11c.; other, 6c.@8c. Antwerp raspberries, 8c. qt.; cups, 10c.; native do., 4@5½c.; black caps, 6@11c. Cherries, plenty for the moment; fancy table, 9c. ₱ lb.; good, 6@8c.; sour and common, 3@5c. Currants, 5@6c. Gooseberries, $1.75@$2 ₱ bush. Whortleberries, 14c. qt.; boxes, $2@2.50; wild Blackberries, Southern, 8@10c. qt. Flor. Watermelons, $25@35 per 100. Geo. goose plums, ½ bush. pkg., $2@2.50. Bush plums, qt., 5@6c. Prime Geo. peaches, $2@3 ½ bush. crate. N. C. Hales, $1.50@2.50. Peanuts quiet, but there has been a fair trade. Va. hand-picked, $1.40@1.45; prime to fancy, $1.27½@1.35; good to prime, $1.20@1.25; shelled per lb., 5½@5¾c. Hot-house B. Hamburg and Muscat Grapes, 75c.@$1 per lb.; Sweet Water, 50@75c.

FLOUR.—The flour market closes quiet but firm for the low grades, and quiet and more or less depressed and irregular for the better grades. The features of the market were in fact about the same as for several days past. Corn meal was in moderate demand and steady. Quotations:

Flour, No. 2, per 196 lbs., $2.50@3.30; superfine State and Western, $3.50@3.90; shipping extra State, etc., $4@4.15 Western spring X, $3.95@4.20; Western spring XX and XXX, $4.25@6; "patent" Minnesota, $5.50@8; Wisconsin and Minnesota rye mixed, $4.20@ Western winter shipping X, $4.35@4.65; Western XX and XXX, $4.75@6; city shipping extras and fancies, $4.15@5.25; Southern shipping extras, $4.50@5; do., bakers' and family brands, $5.25@6.25; rye flour—superfine State, $3.30@3.50; corn meal—Western, etc., $1.90@2.35; do., Brandywine, $2.50@2.55.

GRAIN.—The wheat market was irregular: red winter was easier, but No. 2 spring and generally held at 1c. advance. There was only a small business, however, either on the spot or for future delivery. Sales on the spot at $1 18 for car lots of No. 2 red; $1 15 for ungraded red; $1 15 for No. 3 spring; 92½@95c. for No. 3 do.; 75c. for rejected do.; $1 14½ for mixed winter; $1 12 for ungraded red State, and $1 16 for extra white. Futures, $1 15@$1 14 for No. 2 red for July, $1 00 for Aug. and $1 10 for No. 1 white for Aug. Corn was irregular, opened lower and closed a shade firmer; trade was quiet throughout. Sales on the spot at 40@43½c.; for ungraded mixed, 43c.; for steamer do., 43c.; for No. 2 do., 47c; for low mixed, 44½@45c; for yellow Western and 49c. for No. 2 white. For future delivery sales at 42½c.; for steamer for June; 44c for do. for Aug., and 45½c. for No. 2 for do. Rye was dull and nearly nominal at 61½c. State and Canada, and 60@61c. for Western. Oats were dull and lower. Sales including Western and State mixed at 35@38½c.; do., white, 37½@42c.; No. 2 mixed, 37½@38c.; No. 2 white, 38@38½c.

VISIBLE SUPPLY OF GRAIN AT THE PRINCIPAL POINTS OF ACCUMULATION.

	1879. *June 21.*	1879. *June 14.*	1878. *June 22.*
Wheat, bush	13,893,032	13 930,328	5,352,467
Corn, "	11,516,571	11,666,721	8,151,349
Oats, "	2,051,644	1,981,291	1,886,883
Barley, "	441,396	531,285	1,044,832
Rye, "	434,402	458,265	404,100
Totals	28,336,049	28,567,890	16,839,631

HAY AND STRAW.—The market is quiet, but receipts run light and there is no change in prices. Receipts of new hay expected next week.

Hay, prime timothy, per 100 lbs., 75@80c.; medium, 55@70c.; shipping grades, 40@50c.; clover, good, 45@50c.; inferior, 35@40c. Straw, No. 1 rye, 50@55c.; No. 2 rye, 35@45c. Oat straw, 35@45c.

Exports since Jan. 1st, 32,464 bales; in '78, 34,091 do

HOPS.—The tone of the market continues strong. Brewers buy fairly and exporters have shown a better disposition to operate. English advices report the fly as having appeared in the yards, and the markets as exhibiting a better tone for American hops. State advices continue to report an unfavorable appearance of the vine and a reduced acreage. It is said that Madison Co. alone has 500 acres less this year than last. Prices in the interior are higher than here. We note a fancy sample sold to a brewer at 14c., but such lots are very rare. To bring that rate the hops must be perfect in all respects.

Crop of 1878—State, strictly choice, 12@13c.; good to prime, 8@10c.; fair to good, 7@9c.; poor to fair, 5@7c.; good to prime, 3@5c.; poor to good, 2@3c.

POULTRY AND GAME.—In cooped stock, chickens show the most marked decline. Fowls sold high early in the week, but are drooping again with free receipts. Turkeys dull and low. Geese in light demand. Spring ducks, 60@75c. @ pair.

Chickens, best, per lb., 18@19c.; small, 14@17c.; fowls, N. J., 11½@13c.; Western, 10½@11c.; Southern, 10@10½c.; roosters, old, 5@6c.; turkeys, 8½9½c.; ducks, choice, ₱ pair, 60@70c.; others, 30@45c.; Geese, N. J., Pa. and State, $1.25@1.50; others, 75c.@$1.12; pigeons, 35@40c.

Prime dressed is steady, with moderate receipts. Turkeys, prime small, 14@18c.; fair to good large, 10@11c.; chickens, Phila., 20@25c.; State and Western, 17@19c.; fowls, N. J., choice, ₱ lb., 13@14c.; State and Western, dry-picked, 12@13c.; scalded, 10@12c.; Phila. dry-picked, 14@15c.; ducks, spring, Phila. dry-picked, ₱ lb., 20@23c.; spring, small, 15@18c.; old, Phila. dry-picked, 12@14c.; squabs, dressed, ₱ doz., $2@2.25.

Wild pigeons are the principal birds in market. Stall-fed, $2@2.25 per doz; baited, $1.75; flight, $1.50 Ice-house, Eng. snipe and plover, $2@2.25 per doz., small snipe, 4@50c. Frogs' hind legs, 12@18c. per lb; Squabs, per doz., $2@2.25.

PROVISIONS.—The following are the closing quotations. There is a fair spot business; futures in pork easy and dull.

Pork—Mess, Western old, per bbl., $9.25@9.50; do. new, $10@10.25; prime new, $9.75@10; extra do., do., $8.50@8.75. Lard—Steam Western, per 100 lbs., $6.35@6.37½; prime city, $6.¾@6.2¾. Hams—Smoked city, per lb., 9½@10½c.; pickled, Western and city, 8½@9½c. Shoulders—Smoked, city, 5½@5¾c.; pickled, 4½@4½c. Rib bellies, pickled, 5@6c. Bacon—Long clear, Western and city, 5@5½c. Beef—Western, plain mess, $9.50@10.50; extra do., $10.50@11.50. Beef hams, per bbl., $17.25@17.75.

TOBACCO.—Seed leaf in moderate demand and sales for the week are only 765 cases, including Pennsylvania old crop, 9@18c., and N. E. do., 13@22c.; but mostly crop of 1878 at private prices. Kentucky remains rather slow of sale and business for the week is limited to 600 hhds., of which 450 for export. Prices are steady; lugs 3@5c. and leaf, 5½@14c.

VEGETABLES.—Norfolk is sending heavy supplies of new potatoes. Some lots are too hurriedly shipped, that is, too carelessly packed. Well-culled lots from any point get first call from buyers. L. I. new quotable at $3@3.25 ₱ bbl. Md. and Norfolk choice, $3@3.50; culls, $1@1.25. Over 30,000 barrels arrived per Friday's steamers. Old potatoes have no future interest. Garden stuff has an easy tone. Asparagus about run out. It has been largely canned this season. Cucumbers, Norfolk, ₱ crate, $1.25@1.50. Tomatoes, Norfolk, ₱ bu. crate, $2@2.50; Sav., do., $1.50@2; Fla., do., $2@2.50. Egg plant, Fla., $1.50@2.50. Beans, Norfolk round, ₱ bbl., $1.75@2; L. I. flat, ₱ bag, $1.25@1.50. Squash, Norfolk, ₱ bbl., $1.50. Green Peas, L. I., ₱ bag, $1.12@1.25. Asparagus, Oyster Bay, ₱ doz., $1.25@2. Cabbage, Jersey, ₱ 100, $4@6; Norfolk, ₱ bbl., $1.75@2. Onions, Va. and Md., ₱ bbl., $3.75@4; Bermuda, ₱ crate, $1.75 Beets, Jersey, ₱ 100 bunches, $1@1.25. Turnips, Jersey, new, ₱ 100 bunches, $1@2. Carrots, ₱ 100 bunches, $1@1.50.

WOOL.—There is a fair demand from manufacturers and prices continue to be held firmly. Receipts are quite free and holders generally free sellers at current rates. California wools a very fair movement and rule at steady figures, but our outside quotation is rather extreme, except for exceptionally choice lots. Texas spring grades are plenty and rather quiet at the rates asked. Pulled wools firm.

Ohio, Pennsylvania and West Virginia—X to XX, 38@40c.; No. 2 to No. 1, 36@42c.; coarse, 34@36c.; combing, 38@44c.

State and Western—X to XX, 36@38c.; No. 2 to No. 1, 35@40c.; coarse, 32@35c.; combing, 38@42c.; combing unwashed, 30@36c.

Southern—Medium, unwashed, 30@34c.

LIVE STOCK MARKETS

NEW YORK, Saturday, June 28.

BEEVES.—Receipts for the week, 10,976 head; do., last week, 11,598 do. There has been a weak, uninteresting market. Even with moderate receipts, some prime fat stock was left over. Liverpool quotes American beef 7d. per lb., which is favorable for exportation. Extreme range of prices for the week, 8@10c.; sales chiefly at 8½@9¼c.

COWS AND CALVES.—A car-load of Md. cows sold at $32 per head; a few State at $30@50, mostly at $41; an extra milker might bring $60, but it will not pay to seek customers.

VEAL CALVES.—Trade is only fair at 4½@6½c. for fair to extra milk and 2¾@3¾c. for buttermilk.

SHEEP AND LAMBS.—Receipts for week, 34,772 head; do. last week, 33,739 do. Supplies proved heavy, as 20 cars were unsold at the close; demand slight; quotations, 3½@4½c.; lambs, Western, Southern and State, 5@6c.; N. J., 6½@7c.

HOGS.—Receipts for week, 26,648 head; do. last week, 25,539 do. No sales alive; nominal rates given at $4@$4.20 for 100 lbs.

City-dressed, $5.37@5.87.

THE HUMBLE BEE.

R. W. EMERSON.

INSECT lover of the sun,
Joy of thy dominion!
Sailor of the atmosphere,
Swimmer through the waves of air,
Voyager of light and noon,
Epicurean of June,
Wait, I pray thee, till I come
Within earshot of thy hum—
All without its martyrdom.

When the south wind in May days,
With a net of shining haze
Silvers the horizon wall;
And, with softness touching all,
Tints the human countenance
With a color of romance;
And infusing subtle heats
Turns the sod to violets—
Thou in sunny solitudes,
Rover of the underwoods,
The green silence dost displace
With thy mellow breezy bass.

Hot midsummer's petted crone,
Sweet to me thy drowsy tune,
Filling of countless sunny hours,
Long days, and solid bank of flowers,
Of Gulfs of sweetness without bound,
In Indian wildernesses found;
Of Syrian peace, immortal leisure,
Firmest cheer and bird-like pleasure.

Aught unsavory or unclean
Hath my insect never seen,
But violets and bilberry bells,
Maple sap and daffodils,
Clover, catchfly, adder's tongue,
And briar roses dwell among:
All beside was unknown waste,
All was pictured as he passed.

AN ALLEGORY.

BY M. A. O.

DOWN among the blue-grass meadows and waving cornfields of old Kentucky I first saw the light. At that time when the early frost first tints the leaves all crimson, golden and brown—when the cricket underneath the door-stone sings his melancholy song, and the old farmers say one to another, "cool days for September." My advent into the world was in exact keeping with Topsy's idea of originality; I was not born, "I growed." Without father or mother, the great mother of all looked with compassion on my impotent condition, and wrapped a fleecy snow-white blanket about me, and I was rocked to sleep in the great cradle of the universe, and slept for months. I awoke with the realization that a great change was going on about me. I had outgrown my first feebleness, and the spotless cloak of infancy was exchanged for a dress of most imperial green. As the days sped by I grew in strength, and the rich, variable luster of my dress became the admiration of all. In its soft, low rustle, the farmer thought he heard sweet music.

But a rapid change took place. The torrid summer sun looked fiercely down upon me until my dress partook of the golden hue of that great luminary, when I stood forth like that sun himself, in pure, pale gold. Now more than ever before was my beauty bespoken by men. The uprightness of my bearing, the graceful yet modest poise of my head, and each little movement that I made, were objects for their admiration.

Thus passed those balmy, blissful days, which were by far of too short duration, for even while men bespoke my many charms, the grasping greed of their nature coveted my richness. Anon came a day of great confusion. Men went hurrying here and there, their shouts mingling with the tread of horses, and the clatter and clash of machinery, and ere long cruel irons forever separated me from that kind foster-mother, from whose bosom I had drawn the nourishment that supported and strengthened me, until I attained my full size. A new phase of life was before me. Helpless and prostrate I lay beneath the scorching rays of an August sun, when the strong arms of a man gathered me for a moment in a close embrace, while he bound me to others of my kind. We were then formed into companies and left standing on the field where we were slain. A couple of days later the hard-handed disciples of Ceres in the most uncourteous manner thrust our little company into rude wagons, and conveyed us to a homely building built of rough-hewn timbers and unplaned boards.

My stay here proved to be only the first stage of my bondage among mankind. The days passed until they numbered a month, and, only the patter of the raindrops on the roof and the shriek of the night-owl broke the monotony of my daily life. Then came another change. Human hands carried me into the very jaws of a riotous, monster who speedily disrobed me of my bright yellow dress, and I was cast aside arrayed only in a scanty covering of an unostentatious auburn color. My captors next sent me to a distant city, where without ceremony I was hustled on board a noble steamer. There were no parting handshakes, no good-byes, such demonstrations are not for my kind. Soon the bell rang out the final warning "all aboard" and we moved away from the wharf, and up the broad river, whose banks on either side presented an ever changing panorama of nature. We soon passed within the shadows of a flourishing town, and anchored beside a huge stone structure. A sound came from within like the dull, low, rumble of distant thunder, which increased to a deafening roar as I passed over the threshold. There I realized my utter helplessness. I was subjected to excruciating torture, and brought in contact with base material hard as the nether millstone. I was beaten and bruised until my heart was crushed within me and my whole nature changed. From this rack of torture I came forth clothed in pure white, and prepared for my final journey to the great metropolis.

Once on board the cars, we sped across the country like the shadow of a cloud, and my destination was soon reached. Here I was removed to a department where various apparatus for transfiguration were arranged, and here I met my appointed fate. By prolonged mingling with materials, heretofore unknown to me, my whole structure became changed. My particles were united into one plastic body, in which condition I was thrust into a fiery furnace. But the fervent heat, instead of proving my destruction as I had expected, tended only to increase my proportions, and to perfect my complexion.

The hour of my deliverance arrived. I now was clothed in a hard, shell-like, brown dress, and through my whole being pervaded a most exquisite perfume, which seemed to attract a little, hungry newsboy, who bought me of my master for a penny. To satisfy his hunger was the sole reason for which I had suffered so many transformations, been through the hands of so many different people, and traveled hundreds of miles—it was the object of my life. Thus ends the career of a kernel of wheat.

A WONDERFUL PET.

You have heard of wonderful dogs and horses by the score, but I fancy you have not often heard of a pet elephant. In India, where elephants are numerous, they are employed in different kinds of service, and I will now tell you a true story of one who was a pet.

Old Soup (for that was his curious name) was born more than a hundred years ago, and he lived about two years since on the banks of the river Ganges, near the city of Cawnpore. The story of his life would be a very interesting one, if he could only tell it; but, you see, he has outlived all his early friends, and so there is no one to tell it for him.

When Old Soup (or *Soupramany*, as the natives called him) was *young*, he was trained for war; and used to go out fighting and hunting with his black masters, and many a savage battle did he have with the hard-skinned, one-tusked rhinoceros.

Well, Old Soup was one day working with a number of other elephants and some soldiers in loading a ship with bags of rice. Major Daly was the officer in charge of the soldiers, and Old Soup and the other elephants belonged to him. This was just about the time of Old Soup's hundredth birthday, and as the elephants, one by one, marched up to the ship's side and delivered their bags of rice, Major Daly's little boy and girl stood watching the old fellows at their work.

What was the reason I cannot say—whether it was the heat of the sun, or the hardness of the work, it is impossible for me to tell—but all at once one of the elephants began to throw his bags of rice into the river, and the major soon saw that the animal had gone mad.

The mad elephant, having killed his keeper, turned and ran towards the major's children, who were hurrying with their nurses to get in-doors. How they would have fared if they had been left to themselves I cannot say; but old Soup was there, and when he saw the mad elephant chasing the major's children, he dashed in between them and fought the mad creature until he laid him dying on the ground.

It was a terrible fight. It lasted for an hour and a half; and though old Soup was conqueror in the end, he had many wounds to remind him of the struggle. His ears were badly torn, and his head bruised, and one of his tusks was broken off short; but he saved the lives of his master's children, and I am not surprised that they made him a pet after that.

But he became something more than a pet: he became a nurse as well, and often would he take the children out by the hour together; and the major said, over and over again, that he would far rather trust his children with old Soup than with any number of Hindoo nurses. He became quite a fisherman, too, and might often be seen on the banks of the Ganges helping his little friends to catch the golden teneh which abound in that river. One of the boys would bait the hook for him and take off the fish, but he would hold the fishing-rod with the tip of his trunk, and would land the fish as well as any one.—*Children's Magazine.*

THE HORTICULTURAL CLUB.

"Dolly Dutton" Sweet Corn.

I HAVE sent a package of sweet corn of the above new variety to each member of the club whose name and address I have on my list. It is said to be the earliest sweet corn ever introduced. It is a very dwarf growing sort, the stalks reaching a hight of from three to four feet. The ears are small, averaging from four to five inches; the kernels are of medium size, tender, very sweet and delicious. It ripens from seven to ten days earlier than the Early Minnesota. Plant it soon after you receive it, one kernel in each hill, and the hills one by two and one-half feet apart. Give it the best of care and cultivation, and be sure you save some for seed for next year. I shall be pleased to receive reports of how you planted it, and how your gardens are prospering. New members can join at any time. UNCLE MARK.

WHAT SHE THINKS OF THE CLUB.

DEAR RURAL:—With many wishes for your success among young and old, I think this Children's Club is a good thing, and will help both the little ones and you. I send the names of my two boys and a sister, one only six years old. They desire to join the Horticultural Club, and I hope to make farmers of them—to make them love as well as live by the farm. Only a few months from the city, farm life has many surprises, and I hope it will always charm as now. MRS. M. S. MILLER.
Norfolk Co., Va.

LETTERS FROM BOYS AND GIRLS.

UNCLE MARK:—I see in the last number of the RURAL, that Uncle True has given up his purposed voyage. I have spent many an idle minute in imaginary voyages, and find it quite pleasant. The only book I need is Eclectic Geography No. 3; thus I make that branch of study very interesting, which is by many considered dull. I am very fond of vegetables, but care but little for flowers. I think a rich source of pleasure and profit for the cousins, would be to have a swarm of bees. Procure, if possible, Italians, in a good movable frame hive, and never handle them without smoke, which makes them harmless. If you have no smoker, twist a roll of cotton rags an inch thick, light one end and hold near the entrance, and blow the smoke into the hive for a moment or so until they set up a peculiar hum, then wait a moment and blow again; they are now ready to handle. If any elevate their sting, give them some smoke. Respectfully yours,
Pickaway Co., Ohio. ALLEN LEWIS.

The Little Carpenter.

OF course all the cousins know what a bee is, but I don't know whether they have all noticed the wonderful home of the carpenter-bee. The carpenter-bee is rather pretty and has a sort of auger with which it bores in wood. Its house is quite a wonder, the doorway is round, just the size of the bee's body and opens into a long passage from which smaller openings lead into the cells. In these cells the eggs are laid. Along with the eggs are put a number of spiders, on which the young bee lives till it is large enough to come out. Before the young bees are full grown the old bee gets some clay with which she fastens up the doorway and then leaves the young bees to make their own way out. EDITH H. TAPLIN.
BERGEN CO., N. J.

[I am inclined to doubt the carnivorous nature which Edith attributes to this bee. The larvæ feed upon pollen or bee-bread the same as the larvæ of other bees.] U. M.

DEAR UNCLE MARK:—I would like to belong to the Horticultural Club. I love flowers and like to take care of them. I have some of my own. Mamma has some very nice plants, grown from seed sent by the RURAL. My brothers have land every year to grow crops for pocket money. They raise pop corn, potatoes and beans. I will ask them to join the Club and tell you how much they make. I can catch the horses, ride the colts and drive the milk to the factory. I have a little pet kitten, and I am eleven years old. Please give my love to Uncle True and the Editor. I am going to the lot to pick potato bugs now. Your affectionate niece,
Onelda Co., N. Y. ALICE SPARROW.

[The Editor and Uncle True thank Alice for her love and send her their affection in return.]

DEAR UNCLE MARK:—We have taken the RURAL only this year. We have been living in the country only a few months, and have not had opportunity to have much of a flower garden. This fall we hope to have a flower garden. Unfortunately, the moles have destroyed most of our RURAL flower seeds. We hope the loss will teach us the lesson to be more careful. Our lovely yellow Jasmine, low and tall Ivy grow in wild profusion, and have been excelled but by few garden flowers. I would have been very glad to have been a recipient of your new radish seed. I would like to join your traveling party also: or has it been abandoned?
Norfolk Co., Va. HELEN J. WILSON.

DEAR UNCLE MARK AND COUSINS:—I want to join your Horticultural Club, if you will accept me. I like the RURAL, oh, ever so much, and especially the letters from my dear cousins. I read of their earnings, which induces me to tell that I, a twelve-year-old school girl, with only two years' experience in farm life, have sold $6 worth of chickens. I thought I did pretty well, but perhaps the cousins will laugh at such a small sale after reading Robert Harbison's letter. My garden is doing nicely, and my watermelons thrive well under the directions given in the RURAL. I like Miss Jack's letters, and would like to hear again from Miss Blair. FRANKIE M. BROOKS.
Dane Co., Wis.

DEAR UNCLE MARK:—I am a little girl, ten years old. I go to the academy, where I read in the fifth reader and study arithmetic, and Colton's geography, grammar, spelling, writing and drawing. I have a little sister six years old. We have a flower bed this year, ten feet long and four feet wide, filled with Pansies, Verbenas, Phlox, Petunias and a number of other plants, with some of the RURAL seeds. I am sorry that I am too late for the package of radish seeds. Please enter my name and my sister's on your Horticultural Club.
Oswego Co., N. Y. ETTIE ROBBINS.

DEAR UNCLE MARK AND COUSINS:—It would give me great pleasure if you would receive me into your circle. I would like very much to join your Horticultural Club. I have taken great interest in our little corner. I have a vegetable garden and am also a great lover of flowers. Uncle Mark, I think that story, "An Ugly Girl," is a splendid story. This is the first letter I have written to Uncle Mark, so please do not throw it into the waste-paper basket. LAKE SIDE.
Wesleyville, Pa.

UNCLE MARK:—Please take me into your circle of boys and girls. I will try not to trouble you too much. I like flowers very much, although I have but a few house plants, but I have sown a good many seeds, and hope they will do well. I think it would be nice for the members of the Horticultural Club to exchange plants with one another. Please put my name on the list of the Horticultural Club. I am thirteen years old. Yours truly,
Madison Co., Iowa. IDA M. WILSON.

Sabbath Reading.

"FOR MY SAKE."

THREE little words, but full of tenderest meaning;
Three little words the heart can scarcely hold;
Three little words, but on their import dwelling,
What wealth of love those syllables unfold!

"For My sake" cheer the suffering, help the needy,
On earth this was My work, I give it thee;
If thou wouldst follow in thy Master's footsteps,
Take up My cross, and come and learn of Me.

"For My sake" let the little ones be tended,
All that I gave unto thee safely keep;
I took them in My arms, received, and blessed them,
Do now the same for Me, "Feed now My sheep."

"For My sake" let the harsh word die unuttered
That trembles on the swift impetuous tongue;
"For My sake" check the quick rebellious feeling
That rises when thy brother does thee wrong.

"For My sake" ever press with patience onward,
Although the race be hard, the battle long;
Within My Father's house are many mansions,
There thou shalt rest and join the victor's song.

And if in coming days the world revile thee,
If "for My sake" thou suffer pain and loss,
Bear on faint heart, thy Master went before thee,
They only wear His crown who share His cross.

O Thou, dear Lord, who walked on earth incarnate,
Fain would we follow, but we fear to fall;
Lo! at Thy feet we bend, Thy aid imploring,
Our only plea that "For Thy sake" we call.

[*National Baptist.*

ST. PAUL AND INGERSOLL.

THE most eloquent of materialists, Col. Ingersoll, Monday, delivered a discourse over the remains of his brother. Side by side with his oration we give the words of St. Paul:—

So also is the resurrection of the dead. It is sown in corruption, it is raised in incorruption:—

It is sown in dishonor, it is raised in glory; it is sown in weakness, it is raised in power;—

It is sown a natural body, it is raised a spiritual body. There is a natural body, and there is a spiritual body.

And so it is written, The first man Adam was made a living soul; the last Adam was made a quickening spirit.

Howbeit that was not first which is spiritual, but that which is natural; and afterward that which is spiritual.

The first man is of the earth, earthy: the second man is the Lord from heaven.

As is the earthy, such are they also that are earthy: and as is the heavenly, such are they also that are heavenly.

And as we have borne the image of the earthy, we shall also bear the image of the heavenly.

Now, this I say, brethren, that flesh and blood cannot inherit the kingdom of God; neither doth corruption inherit incorruption.

Behold, I show you a mystery; We shall not all sleep, but we shall all be changed.

In a moment, in the twinkling of an eye, at the last trump; for the trumpet shall sound, and the dead shall be raised incorruptible, and we shall be changed.

For this corruptible must put on incorruption, and this mortal must put on immortality.

So when this corruptible shall have put on incorruption, and this mortal shall have put on immortality, then shall be brought to pass the saying that is written, Death is swallowed up in victory.

O Death, where is thy sting? O Grave, where is thy victory?

The sting of death is sin; and the strength of sin is the law.

But thanks be to God, which giveth us the victory through our Lord Jesus Christ.

MY FRIENDS:—I am going to do that which the dead oft promised that he would do for me. This loved and loving brother, husband, father, friend, died where manhood's morning almost touches noon and while the shadows still were falling towards the West. He had not passed on life's highway the stone that marks the highest point; but being weary for a moment, he laid down by the wayside, and using his burden for a pillow, fell into that dreamless sleep that kisses down his eyelids still. While yet in love with life and ruptured with this world he passed into silence away. This brave and tender man in every storm of life was oak and rock, but in the sunshine he was vine and flower. He was the friend of all heroic souls. He climbed the hights and left all superstitions far below while on his forehead fell the golden dawning of the grander day. He loved the beautiful, and was with color, form and music touched to tears. He sided with the weak, and with a willing hand gave alms. With loyal heart and with the purest hands he faithfully discharged all public trusts. He was a worshiper of liberty, a friend of the oppressed. A thousand times I have heard him quote these words: "For justice all place a temple and all season Summer." He believed that happiness was the only good reason, the only torch, justice the only worshiper, manhood the only religion and love the only priest. He added to the sum of human joy, and were every one for whom he did some loving service to bring a blossom to his grave he would sleep to-night beneath a wilderness of flowers. Life is a narrow vale; we strive in vain to look beyond the hights; we cry aloud, and the only answer is the echo of our wailing cry. From the voiceless lips of the unreplying dead there comes no word, but in the night of death Hope sees a star and listening love can hear the rustle of a wing. He who sleeps here when dying, mistaking the approach of death for the return of health, whispered with the latest breath, "I am better now." Let us believe, in spite of doubts and dogmas, in spite of fears and tears, that these dear words are true of all the countless dead.

And now, to you who have been chosen from among the many men he loved to do the last, sad office for the dead, we give his sacred dust. Speech cannot contain the love we bear. There was, there is, no gentler, stronger, manlier man, and now for wife and children, for myself and mine, we tender to you, one and all, our dearest life.

Which does the reader prefer?—*New York Mail.*

PERSONAL ITEMS.

General Wood, one of the British commanders in the Zulu war, has never undressed or had his boots off, save for his bath, since the 10th of January last.

Daniel Hayes, grandfather of the President, was once carried away to the frontier of Canada and kept a prisoner for two years by the Indians, in retaliation for a boyish freak in abbreviating the tail of a dog. He is buried in the old cemetery at Granby, Conn.

General Grant, who will reach San Francisco in August, expects to remain on the Pacific coast for several weeks, and will then go to Galena and stay until cold weather. He has not decided where to spend the winter, but may go to Florida and Havana.

The three children of Senator Hill, of Colorado, are young persons gifted with great health and strength. "I ascribe their fine development to their being allowed plenty of sleep in their childhood, and never being allowed to keep late hours," said the Senator to some one remarking upon their beauty.

James Palmer went into an undertaker's shop at Riverton, Va., and got measured for a coffin, which he said was for a man exactly his size. "Have it ready this afternoon," he said, "for the corpse will be ready by that time." Then he went to a railroad track near by, lay down on it, and let a train run over him.

Senator H. W. Blair, the newly-elected Senator from New Hampshire, has taken his seat. He is a young man, not over 45 years of age, tall, slender, and, with the exception of chin whiskers, looks very much like Senator Don Cameron. He was cordially greeted by his fellow-Senators and many members of the House.

Mary Clemmer says that no men in Washington public life have changed so rapidly in appearance as Conkling, Carpenter and Blaine. "While men like Senators Hamlin and Morrill do not look a day older than they did ten years ago, these three men, who are more than twenty years younger, have grown swiftly old by their sides."

Senator Conkling, says a correspondent, probably pays more attention to his physical condition than any other Congressman, regulating his diet, exercising, and abstaining from strong drink and tobacco. He thus preserves his manly form, though his Hyperion curls are rapidly disappearing, including the little top-knot which used to point heavenward.

On the occasion of Sir Garnet Wolseley's departure for the war among the Zulus about three hundred persons assembled at Bristol, England, at midnight to meet the express train that carried him. The enthusiastic crowd, says the London Truth, fought for a shake of Sir Garnet's hand through the window (little witting that a lively member of the staff was holding out his hand to save his chief) until the train left the station.

In one of the four letters written on the last day of his life, Charles Dickens disclaimed irreverent intention in any scriptural reference in his works, and added: "I have always striven in my writings to express veneration for the life and lessons of our Saviour, because I feel it; and because I re-wrote that history for my children, every one of whom knew it from having it repeated to them, long before they could read, and almost as soon as they could speak. But I have never made proclamation of this from the house-tops."

No one can be sick if the stomach, blood, liver and kidneys are well. Hop Bitters keeps them well.

Implements and Machinery.

Attention, Owners of Horses!

THE ZINC COLLAR PAD is the only permanent and reliable pad for sore-necked horses or mules, that has ever been produced, and has been greatly improved since Jan. 1st, by being specially fitted to first-class tight and loose-topped collars. The new pad of proper sizes will fit either. Being of smooth metal, they do not wear the mane, and always dispense, when needed, their medicinal virtues. There are over a million and a half of them in use. Pads made of other material can only temporarily have any curative properties whatever, and soon become worthless by abrasion in cleaning them. The Zinc Pads are sold by leading Saddlery Houses throughout the country, and harness makers generally. Ask your Harness Maker for them.
Manufactured by ZINC COLLAR PAD CO.,
BUCHANAN, MICH.

ESTABLISHED 1840.

The Robbins Cultivator

AND BROADCAST SEEDER.
CHEAP! "The Implement for the Times." CONVENIENT!

Adapted to almost every variety of farm tilling and seeding, and sold at less than the price of a Grain Drill alone.
THE ROBBINS is a two-horse riding or walking Cultivator: is especially adapted to breaking up fall plowing and fitting it for spring crops; for cultivating Corn, Potatoes, Beans, or any crop planted in rows or drills, the axle being set high enough to clear corn at the last working; for work on fallows, and for fitting any ground which would ordinarily require cross plowing.
It is provided with an accurate and reliable *force feed* seeding attachment, which sows all kinds of grains *broadcast*, in front of the shovels, in any desired quantity to the acre; and by gauging the depth at which the shovels are allowed to work, the grain can be covered as deep or as lightly as desired. Send for circular,
Manufactured by the
Robbins Cultivator Co., Jackson, Mich.
And for sale by dealers generally.
State you saw this in the Rural New-Yorker.

BIRDSALL ENGINE.

Possesses More Points of Excellence than Any Other now Offered.
IT CERTAINLY STANDS UNRIVALED IN EFFECTIVE POWER, AND THE SAVING OF FUEL AND WATER.
Its saving qualities are super-excellent. Its steaming capacity saves time. Its durability saves repairs. Its weight saves heavy hauling. Its simple construction saves employing skilled engineers, and many times, much perplexity and vexation. The genuine material used in their manufacture saves breakages. The satisfaction they give saves jobs, saves money, saves reputation, and preserves the good will of all. Trial given in all cases before requiring payment. For special circulars address

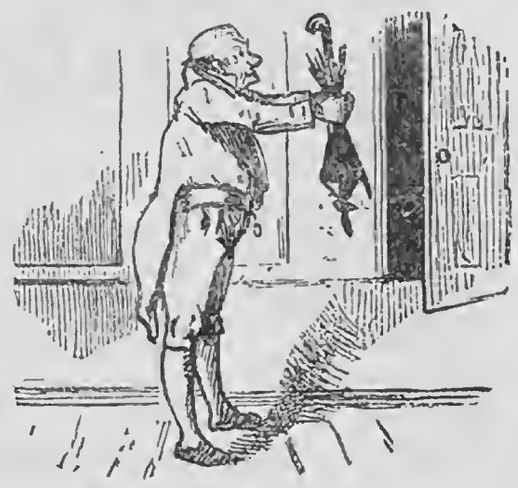
WHAT CAME OF A SUMMER SHOWER.

2. I wonder who that is behind the tree."

3. It was so lucky he had an umbrella, even after the rain left off.

1. It was coming on to rain, and she took shelter under a tree. Presently a footstep was heard.

4. It was solemnized in the village church, and the villagers attended.



5. "Confound your impudence," he exclaimed, twelve years later; "it was all your doing."

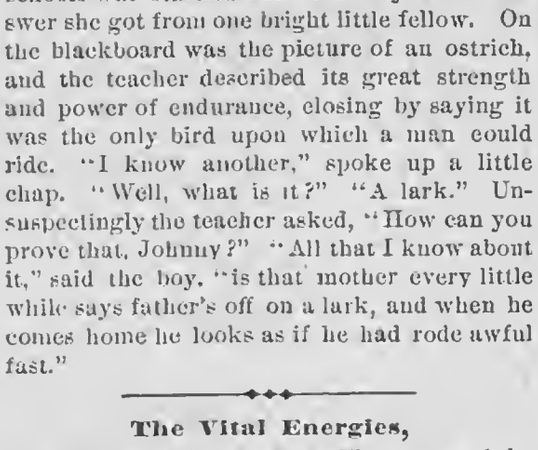
Wit and Humor.

A SHORT time ago a little boy went with his father to see a colt. He patted the colt's head and made quite a fuss over it, until finally the stable-man told him to be careful that the colt did not turn round and kick him. When the little chap went home his mother asked him what he thought about the colt. "I like him pretty well," was the reply. "He's real tame in front, but he's awful wild behind."

A TEACHER in one of the Westfield public schools was startled the other day at the answer she got from one bright little fellow. On the blackboard was the picture of an ostrich, and the teacher described its great strength and power of endurance, closing by saying it was the only bird upon which a man could ride. "I know another," spoke up a little chap. "Well, what is it?" "A lark." Unsuspectingly the teacher asked, "How can you prove that, Johnny?" "All that I know about it," said the boy, "is that mother every little while says father's off on a lark, and when he comes home he looks as if he had rode awful fast."

The Vital Energies,

When depressed by fatigue, bodily or mental, by exhausting diseases, or the influence of a debilitating temperature, should be reinforced—physicians tell us—by some wholesome stimulant; and among those which have been tested and administered by them, none has received such hearty recommendation as Hostetter's Stomach Bitters. It has been preferred by them from the fact that its spirituous basis, which is of the purest description, is modified by, and made the vehicle for, the vegetable medicinal principles incorporated with it. These latter render it conspicuously serviceable in cases of general debility, constipation, and other disorders of the bowels; in dyspepsia, nervous affections, urinary and uterine ailments, rheumatism, intermittent and remittent fevers, which it prevents as well as remedies; and in liver complaint. A household stock of medicines can scarcely be called complete without this inestimable medicine.



We have the best variety of Agricultural Engines in the Market. Not an experiment, but the result of twenty-five years' manufacturing experience. Our Engines are first-class in material and workmanship. Safe, Economical, Strong and Durable. Send for circular. Address,

PRICE FIVE CENTS.
$3.00 PER YEAR.

[Entered according to Act of Congress, in the year 1879, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington. — Entered at the Post-Office at New York City, N. Y., as second-class matter.]

The Herdsman.

EARL BECTIVE'S "DUKE OF UNDERLEY."

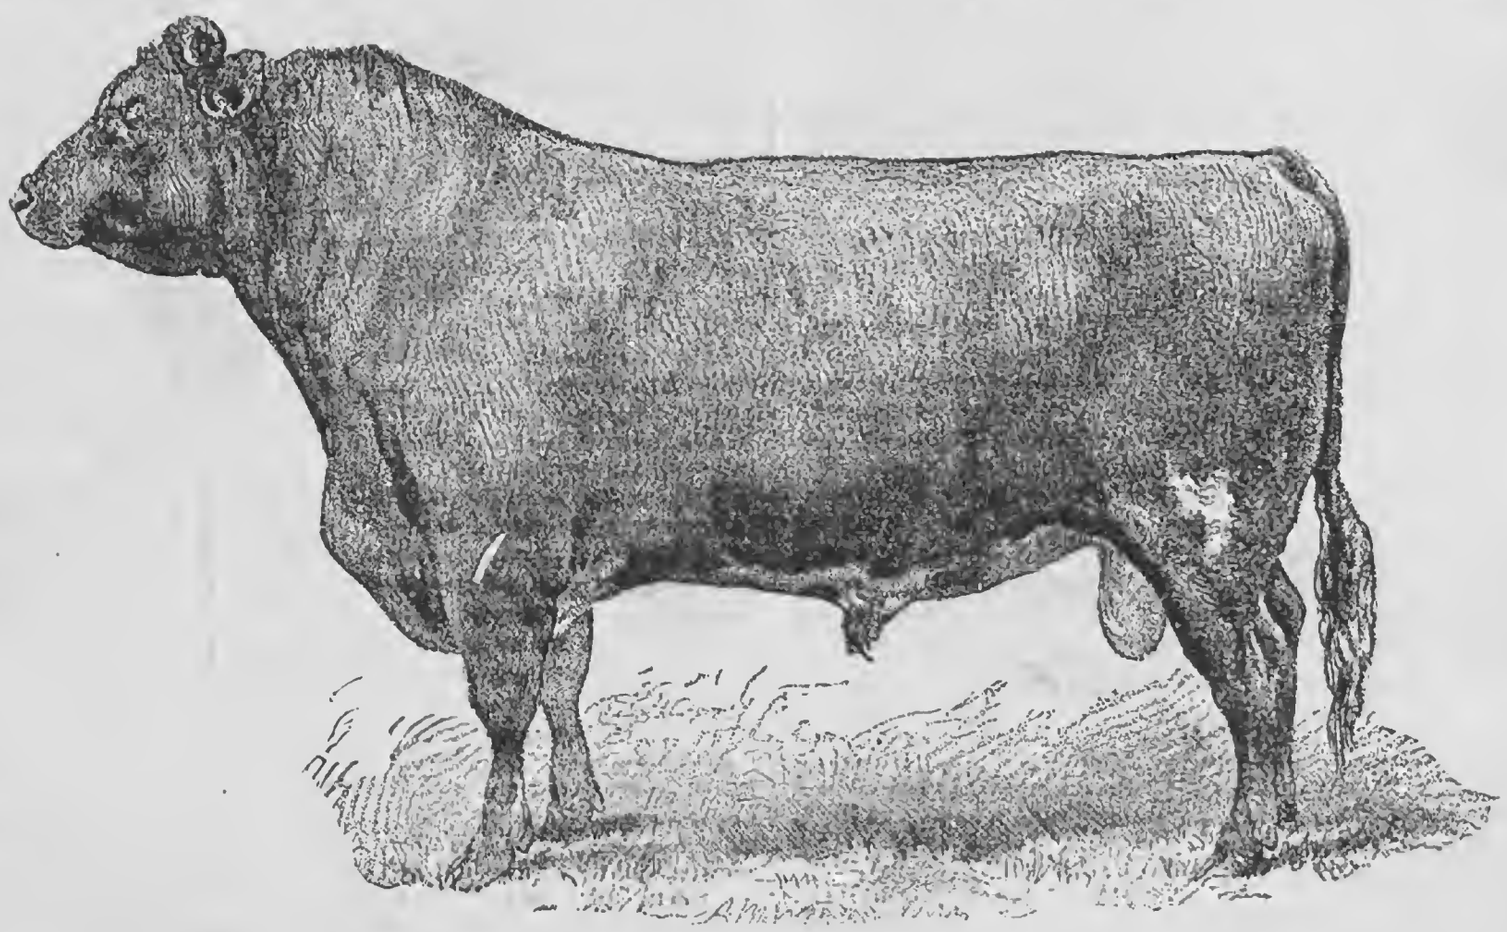
MASON C. WELD.

THE portrait carries with it conviction of its accuracy, and simply as a picture it is worthy of great praise. When will the time come when American photographers and artists will co-operate to produce such a portrait?

THE DUKE OF UNDERLEY numbered 29,389 and (33,745), bred in this country, and dropped in England, was sold in his dam, 10th Duchess of Geneva, at the famous New York Mills sale in 1873,—which I had the pleasure of attending. His sire, 2d Duke of Oneida, 9,926 and (33,702), was bought at the same sale by Mr. Megibben of Kentucky for $12,000, who used him with extraordinary success. His death was chronicled a year or so ago, in many an honorable "obituary," and his numerous offsprings perpetuate his fame. Tenth Duchess sold for the startling sum of $35,000, and many an enthusiastic admirer of this peerless family shook his head as if that was far more than her buyer would ever realize from her. But let us see: The Agricultural Gazette, from which this portrait is taken, says: "It is easy now, after several years, to see that (this) one purchase, at all events, was worth her cost"—and goes on to describe the cow and her sons and daughters in England. It is enough for us perhaps that, bred and handled as they are at Underley, they do full credit to American breeding. The Usurer cross appears in the pedigree of this cow, and this the Gazette fancifully surmises may account for the unusual and beautiful color of the Duke of Underley, his get, and others of the progeny of the old cow. I say *fancifully* because Usurer (9763) was a *roan*. The color is described as "a peculiar, warm-looking, burnt-earth-like red. It is pleasant to look at and it need not be said that his offsprings' coats are pleasant to handle." The Gazette also says of the bull, "He satisfied the most fastidious breeders, whatever their preferences might be." The best cows of the most famous "Bates" herds in England are being sent to him with such results that his service price is fixed at 100 guineas.

It is, perhaps, not necessary to remind the readers of the RURAL that the merit of these fine animals consists in the fact that they possess the most perfect beef points; that is, superior form, being largely developed where the best and most meat lies, smallness of the less useful parts, good handling—which indicates to the expert the quality of rapidly laying on flesh—and evenness in the deposition of fat; nor that these qualities are so strengthened by the fact that they have descended without deterioration through a long line of illustrious ancestry that they are almost unerringly perpetuated in the offspring. This is really that which gives Short-horns their chief value, namely, that for beef they are the best-bred race in the world.

This is the best picture of a Short-horn bull I ever saw. It is drawn from a photograph, by Williams, with great faithfulness not only to the outline but to the light and shade, and his drawing is copied by the photo-engraving process, with, of course, perfect accuracy, but losing much of the delicacy of the pencil which is usually retained in the ordinary process of hand engraving on wood.



EARL BECTIVE'S "DUKE OF UNDERLEY."

CATTLE RAISING IN THE WEST.

L. J. TEMPLIN.

Importance of our meat supply; slight increase in hog production in thirty years; increase in cattle during the same period; capacity of the West to increase the supply indefinitely and cheaply; efforts of that section to improve its herds.

THE question of the future meat supply is one of personal interest to every individual of every civilized community. This question has recently assumed unwonted importance in this country. The successful shipment of both live and dressed beef to Europe, with a demand that is constantly and rapidly growing, opens up the prospect of a demand for our meat, to which we cannot assign any limits. There is also likely to be an increasing demand in this country with the increase of manufactories, that will doubtless follow a return of financial prosperity which is already dawning upon the country. Considering the foreign and home markets, the future demands for American meats promise to be as great as the farmers and graziers of this country can easily meet, even when their facilities are taxed to their utmost. The prevalence of disease among hogs has rendered their production so precarious in many parts of the country, that if this state of affairs continues, we can hardly expect any great development in this industry. Indeed the past history of hog-raising does not promise any great increase in this business. The following table shows the number of hogs in the United States at the dates given:

1850	30,354,213	1870	29,475,500
1860	36,980,772	1875	25,726,800
1865	13,616,876	1878	32,262,500

From this it appears that for nearly thirty years the number of hogs in the country has fluctuated between less than fourteen and nearly thirty-seven millions, the diminution being greatest at the close of the war. During a part of this time their production has been stimulated by extraordinarily high prices; and yet in thirty years there has been an increase of only between two and three million hogs in the country. It appears, therefore, that we are to look to our cattle for a supply to meet the growing demand for meat both on this and the other side of the Atlantic.

The number of cattle in the United States has been for the different dates as follows:

1850	17,778,907	1870	28,074,580
1860	28,967,028	1877	30,522,400

Making allowance for the falling-off during the war—which was not quite regained in 1870—there has been a healthy increase during each decade. A large part of this increase has been in the States west of the Mississippi River, and it is to this region we are to look for the principal part of the cattle to meet the growing demand for beef. A few of these new States show the following results:

	1850.	1860.	1870.	1878.
Texas	333,000	4,397,414	3,990,158	4,008,300
Kansas	——	128,397	701,347	892,243
Colorado	——	——	159,456	430,000
Nebraska	——	39,681	392,716	298,807
Minnesota	2,002	149,080	365,241	539,800
Total	335,002	4,713,563	5,608,918	6,159,150

In this enumeration I have taken no account of New Mexico and other parts of the West from which many thousands of cattle are annually sent to the Eastern market. Supposing the older States to continue to produce as many as heretofore — which is probably about as much as is to be expected—it is evident the principal increase to meet any enlarged demand, must come from the newer States of the plains and mountain regions of the West.

This being the case, two questions arise for solution: first, has the West the facilities for producing an unlimited supply of beef cattle; and, second, can they be produced at such prices as will place the meat in market at living prices to the consumer? It is evident that the Western stock-growers must produce cattle more cheaply than the farmer of the Eastern States, lest when they have paid the often enormous transportation charges levied by the railroad companies of the country, the balance shall be found on the wrong side of the ledger. A statement of the facts as they exist, will be a sufficient answer to both of the above questions. The five States named above, have nearly one and a quarter millions of milch cows now on hand. With such a start, they are capable of almost unlimited increase of their herds within a few years. The facilities for grazing in these States and the adjoining Territories are almost without limit. Thousands, and even hundreds of thousands, of square miles of unbroken prairie furnish grass in such abundance that it seems it can never be exhausted. Even in this part of the country, where almost every quarter-section is occupied, there is probably ten times as much grass burned by the annual fires as is consumed by all the stock kept here. Millions of tons of excellent hay thus uselessly pass away in smoke each year in the State of Kansas alone, and the same loss is taking place to a greater or less extent over all these Western States and Territories.

It is evident, therefore, that not only can cattle be raised, but that they can be raised cheaply. Where abundant pasture can be had for nothing, or next to nothing, and hay can be put in the stack at one dollar per ton, and where calves can be bought in the fall at five to seven dollars each, it is evident that beef cattle can be put in the market at quite low prices. The people of the West are waking up to the importance of this industry more than ever. Efforts are being made to raise the grade of the stock by crossing the native herds with Short-horns, Herefords, and other improved breeds of cattle. More care is also being given to providing winter food and shelter for herds. The result is the grade of the stock is being raised, and animals of a better class are gradually making their way to the market. What is wanted now more than anything else in this connection, is more capital invested in this enterprise. Within reasonable limits, the larger the herd the less it costs for each individual animal. This interest is growing, and the world may well look to the great American Desert for an unending supply of choice beef to feed the hungry millions of the East and Europe.

Reno Co., Kansas.

The Horseman.

FARM HORSES AND BREEDING HORSES FOR SALE.

HENRY STEWART.

The whole business of rearing farm horses for sale needs revising. Those who have watched the tendency of the markets perceive a growing export business and a constant demand from farmers, who, living near the large cities, are compelled to grow market crops upon their high-priced land, and cannot give time to the rearing of horses. The number of horses in the United States is largely in excess of that of England and other European countries (excepting Russia), and the introduction there of horse railroads, or, as they call them, "tram" roads, has greatly enlarged the demand for draft horses. Every week horses are shipped to Europe to supply such demands as well as for driving and carriage uses; and it is but recently that mules have been sought and purchased in America for military purposes in Europe or for the foreign uses of European governments. Everything promises well for a large foreign demand for American horses and mules, and it is not only necessary that this demand should be met in advance, but that it should be filled with useful animals.

As a rule, demands are created by the existence of a surplus for sale. The man succeeds best in business who offers something that creates a new want. He must be shrewd enough to perceive that there is a need for what he proposes to supply, and an opening for him to push in and fill. The whole history of successful business proves this. We did not wait until Europe was starving to push our breadstuffs, and provisions and cattle into their markets, but we sent them; and

we literally "cast our bread upon the waters,' and it found at once a destination, a use, and a profitable market. Just now there is a need of draft animals all over Europe. Governments are obliged to sustain costly stud farms and make requisitions upon their scanty home supplies to fill up the ranks of their armies. Those who live luxuriously, have had their attention drawn towards the excellence of our stock, and are willing purchasers for the few animals we have to dispose of.

At the same time our farm stock needs improving. We have a large number of horses that are defective in size, substance and constitutional vigor. Breeding farm horses receives little consideration. The mares selected for this purpose are too often diseased, broken down and worthless for other purposes. No care is taken to select sires for the colts, and the pedigree of the animals used is sufficient if it is truly or falsely said to run back in a cloudy track to Hambletonian, Morgan or some other horse that was popular in his day. There is no thought as to the purpose for which the colt is intended, and the consequence is that a careful purchaser who desires a horse for road work, or farm work, passes over a hundred where he chooses one.

Our farm horses are too light, and our road horses are generally too small. The country is overrun with small ponies which can trot a mile or two at a rate of three minutes or even less to the mile in a single light wagon with one occupant, but cannot draw a light family carriage with four passengers. Nor can a pair of them draw a heavy coach on the best of roads. Desirable heavy farm horses are so scarce that it is almost impossible to secure them, and *good* roadsters will command more than $1,000 the pair, if well mated.

There is a wonderful opening for turning some skill and opportunities to advantage in this way. A colt costs no more to raise than a calf, and at two years old it is worth as much as three cows, if it is only a common one. One of the right kind would be worth half a dozen heifers, and the mare would cost no more to keep than a poor one. The choice of the mare is very important. Large, heavy farm mares, served by a clean-limbed thoroughbred stallion, will produce a coach horse, or, if a heavier well-bred horse is used, the produce will be such as is required for heavy draft in the large cities. The *true* well-bred Percheron, fine-boned but strong-limbed, and gracefully formed yet massive, still showing in the fine small head and high-blooded characteristics his Arabian ancestry, is such a horse as may be used for either of these purposes, if a mare is properly selected. The coarser Norman, broad-footed, wide-shanked, heavy-chested, large-headed and comparatively sluggish, and the admirable Clydesdale, almost as large and heavy, but with finer bones and better evidences of breeding than the Norman, are well suited for the work of the farm and the country roads. Of these we have many fine specimens already introduced, and breeding animals can readily be procured. In truth, there is abundance of material, if the skill and shrewdness to use it well are furnished.

Just at the present, individual effort is out of the question. All the great successes of the world are secured by association. In the breeding of such farm animals as we already have brought to a high degree of excellence, association has been the chief agent of success. The Jersey Cattle Club; the Short-horn Society; the Ayrshire Cattle Association, have brought their favorite herds to the highest pitch of excellence, and we find on every hand conspicuous instances of similar effects. It is hardly to be expected that farmers can succeed by their own single unaided efforts in carrying out their ideas of what ought to be done in improving any breed of animals. But a score or two of them associated in a county may do wonders. A county horse breeders' association of 20 persons might procure and possess a desirable stallion for a sum no larger than they would have to pay, in all, for a single service for each: $50 is a common price for the service of such a good horse as could be purchased for one or two thousand dollars. The money invested would be returned each year, and in most cases a profit could be made in addition; and besides, much benefit could be done outside of the association. The association could procure suitable books and papers, and could study, learn and discuss the important points in breeding, which should be understood, and in that way could turn their opportunities to the best advantage. Breeding is a fine art, and there are general principles upon which success depends, which need to be known and observed. Haphazard work will not do. There are some breeders who seem to have an instinct, an intuitive skill at mating animals; but it is not true that they have any knowledge that "has come by nature" or has been acquired without the closest observation and the study of cause and effect. The secret is that they have given their minds to the business, and have made a special study of it to the exclusion of other matters. They have been inventors, and like others of that useful class, have pored over their ideas and worked them out to results while others have been sleeping. These are the men who succeed, and a great many more of such men are needed in the necessary improvement of our horse stock.

TURNING OUT AND RENOVATING HORSES.

We kept a team in the stable a week and cut grass for them to get them used to an entire change of diet, mixing the grass with hay, and all this time wondering how we should manage, when we did turn them into the pasture, to keep them from running and injuring themselves. We did not like to risk fetters on such lively animals, for fear they might get strained. We had an idea that if they were made very hungry beforehand, they would forget to run, preferring to eat. A neighbor helped us out. We tried his plan and there was no trouble. A surcingle was buckled around the body behind the fore-legs, and the halter passed through this and fastened to a strap buckled tightly around one of the hind legs above the gambrel. The halters were buckled so tightly that the horses' heads were kept down quite low. Turning horses out to grass has a renovating effect on them, especially when they have been kept for any length of time in a city and driven on the pavements. In six months the hoofs of horses not worked or shod, will be renewed; sore-footed animals will have new feet. We know of instances where a New York city horse-dealer purchased a pair of such horses in the spring of a gentleman, and having sent them into the country for the summer, they became so improved that in the autumn he sold the same pair to their former owner as a country team, and the former owner did not know them. F. D. C.

Pomological.

REPORT OF THE LATE CLEVELAND CONVENTION.

Special Correspondence of the Rural New-Yorker condensed.

The Fourth Annual Convention of the American Association of Nurserymen, Florists, Seedsmen and kindred interests was held in the Probate Court Rooms of the new Court House, Cleveland, Ohio, commencing June 18, and continuing three days.

The convention was quite well attended, members being present from very many of the States, and the proceedings were of peculiar interest. The display of fruits and flowers, although not large, was very fine, the Strawberry "Glendale" and the new seedling Geranium "Wm. Cullen Bryant" exciting great admiration.

The morning of the first day was nearly consumed in members registering their names, following which the Hon. Harvey Rice, in behalf of Cleveland, delivered a welcome address to the beautiful Forest City; to which, in behalf of the Association, the President, J. J. Harrison, replied in fitting words.

A Committee on Business was then nominated, which was composed of the following gentlemen: H. B. Ellwanger, Rochester, N. Y.; Peter Henderson, New York City; Capt. E. H. Pratt, Dansville, N. Y.; N. H. Albaugh, Ohio; Robert Douglas, Illinois; Wm. Smith, Geneva, N. Y.; T. S. Hubbard, Fredonia, N. Y.; A. B. French, Clyde, O.; H. E. Hooker, Rochester, N. Y.; W. C. Strong, Boston; S. B. Parsons, Long Island.

Arrangement of Questions.

On a call for questions from the members, to be placed in the hands of the Committee on Business to assist them in making out the order of business, the following gentlemen were nominated as a committee to arrange the questions: E. Moody, Lockport, N. Y.; H. C. Graves, Sandwich, Ill.; W. C. Barry, Rochester, N. Y.; S. D. Bear, Ohio; S. H. Sweet, Dansville, N. Y.; Leo Weltz, Wilmington, O.; Franklin Davis, Richmond, Va. The meeting then adjourned till 2 P. M.

Upon reassembling in the afternoon the Chair appointed Committees on Exhibits of Fruits and Flowers.

The programme for the convention was reported as follows and adopted:

Wednesday, 2.30 P. M.—Address on methods of disposing of nursery stock, by D. M. Dewey. Discussion on above question. Paper on new fruits, by W. C. Barry.

Wednesday, 7.30 P. M.—Address by George W. Campbell, Delaware, O.; subject, "Grape Culture and its Probable Future in the United States." Essay, "The use of the Feet in Sowing and Planting," Peter Henderson. Address, "New Plants, and the Planting of Trees in Landscape Style," S. B. Parsons, Flushing, N. Y.

Thursday, 9 A. M.—Report of Committee on Election of Officers. Reports on amount and condition of stock. The best way to stimulate a taste and desire for choice ornamental trees, shrubs and flowers, S. B. Parsons to lead in the discussion. Suitable stocks on which to work.

Thursday, 2.30 P. M.—Miscellaneous business and discussion.

Thursday, 7.30 P. M.—Addresses, etc. The address of D. M. Dewey on the best methods of disposing of nursery stock was then delivered. He regards the question of the greatest importance to the country at large as well as to the trade. He had learned that the matter was being considered by the Ohio Legislature, which had a bill before it designed to restrict the sale of nursery products. He thought no such bill could pass, as it was almost impossible to frame a bill which would be equitable to all parties concerned. He deprecated all special legislation on the subject, and thought the length of a hoe handle or the curl of a pig's tail could as well be regulated by law as the sale of our products. He suggested that the convention issue certificates of agency, signed by their officers, to be used by its members for their agents, and to caution buyers from purchasing of those who could not produce such certificates.

Some discussion then ensued concerning the bill before the Ohio Legislature, and upon motion of Mr. Albaugh, a committee of five was appointed by the president, to whom further consideration of the subject was referred. With regard to

The Russian Apples.

Mr. Barry thought they deserved serious consideration on account of the many incorrect and exaggerated reports spread about them during several years. Anticipating their value for the colder regions of this country, his firm planted in their experimental grounds some obtained from St. Petersburg, and others from the Department of Agriculture at Washington. In the summer of 1876 several trees bore fruit for the first time. The following year several others came into bearing, and in 1878 nearly all fruited, enabling them to give the different varieties a fair test. But their expectations of finding among them some valuable acquisitions were not fully realized. Under new names they found several of the well-known Duchess of Oldenburgh, and most of them seemed to be of that type, resembling that variety in appearance and size and of about the same quality. One of the number, Titouka, or Titus, is quite promising. The fruit is large and handsome, resembling that of the Twenty Ounce, and ripens in September. This he regards as beyond a doubt the most valuable in the collection. Another, the Groskoe Seleuka Gruner, is of medium size, roundish, conical form; smooth skin, color of Sweet Bough; ripens early in August. The tree is a good grower and bears abundantly. Repka is a handsome fruit, of medium size, resembling the Lady Apple, but larger. The tree is a free grower and very prolific. A few of the Russian Apples he considers worthy of propagation in those parts of the country where our choice varieties do not succeed owing to the severity of the climate; but at the East he thinks they will be of little or no value.

Other Apples.

From California there has been sent a remarkable seedling of the Yellow Bellflower. The apple is large, roundish, inclining to conical; stalk long and slender in a deep cavity; skin of a beautiful golden yellow color, smooth and fair; flesh firm, juicy, sub-acid, rich, and excellent. It is said to keep as well as the Newtown Pippin, and is one of the most promising new fruits that he has seen. * Highland Beauty is a seedling which the Rev. E. P. Roe has introduced to public notice. It is of small or medium size, roundish, inclining to conical; skin light-yellow; flesh tender and pleasing to the taste. It remains in good order till March, and will probably be esteemed as a table fruit. An Ohio apple called the Onstine Greening, is of the Greening type, about the same size and shape; flesh solid and of fair quality, and it has been said to keep in good eating condition till September. This variety should be included in a list which could be recommended for shipment abroad.

Pears.

A very important accession has been made to the list of Pears in the Messrs. Clapps' new seedling, called the Frederick Clapp. This is undoubtedly the best American pear yet introduced. The acquisition of a pear pronounced by competent authorities superior to Beurre Superfin marks an important epoch in the history of American pomology. The tree is a good grower, and nurserymen can afford to propagate it. One of the new pears which deserve to be better known is the Petite Marguerite, raised by Andre LeRoy in 1862 and called Marguerite Appert. It ripens about ten days before the Bartlett. Andre Desportes was raised by Andre LeRoy from seed, and has the delicious flavor of the Bartlett without its muskiness. It may be regarded as one of the best fruits of the season. Ripens in August, and he considers it is one of the best pears ripening in that month.

Cherries, Peaches, Grapes.

Of Cherries of recent introduction, Montmorency Ordinaire is becoming more and more popular wherever grown. It has just acidity enough to be pleasant, and one can eat his fill without any discomfort afterward. Ripening as it does, ten days after the Richmond, it is valuable on that account, not to speak of the wonderfully prolific qualities which the tree exhibits. The year 1878 has been rendered memorable by the large number of new seedling Peaches which fruited in all parts of the country. If the same progress be made in '79, we shall be soon able to boast of ripe peaches in June in New York State.

T. B. Miner's seedling Grapes, twelve in number, seven of which are white, will be watched with considerable interest. Pringle's hybrid grapes, three in number, two of which are white, are now being distributed; so are Mr. George Haskell's, about forty varieties, obtained by hybridization. Some of the best of Rickett's seedlings are now in the market, and in another year this interesting collection will have been tested to some extent. Rockland Favorite is a new grape, said to be a seedling of the Concord, earlier, better, and hardier than its parent, and a great bearer. In New York State there are four new white Grapes which may prove valuable: the Prentiss, owned by Mr. Hubbard, is very promising; the Pocklington, raised in Washington county, is large and handsome, but seems to ripen a little late; Niagara, raised at Lockport and Duchess, at Union Springs, are also highly spoken of by those who ought to know what constitutes a good grape. None of the four is in the market. Some of the newer sorts of Strawberries are getting hard knocks. The Sharpless, however, is highly commended.

The Japan Persimmon would be a valuable addition to our list of fruits were it hardy, but this he thinks is doubtful, but he has not tried it. Mr. Albaugh reported that the Wild Goose Plum in his locality (70 miles north of Cincinnati), was exceedingly profitable. It is of handsome color and good shape—ripens July 4th to 15th. It is fine for dessert, fully as large as the Lombard, but not of good cooking quality. T. W. Manning, of Mass., was very favorably impressed with the Moore's Early Grape. It was ripe with Mr. Moore when the Concord is green. Peter Henderson, of New York, placed the Forest Rose Strawberry ahead of Sharpless—then Seth Boyden, Monarch, Chas. Downing, Capt. Jack, Great American. He had no robins, but the children preferred the Forest Rose. S. B. Parsons, of Long Island, thought highly of the Miles's Grape, which, though not new, was very early and good.

At the evening session, Peter Henderson made a valuable address on

The Use of the Feet in Planting and Sowing Seeds.

He said that although engaged in gardening operations for over a quarter of a century, it has only been lately that he fully realized how indispensable is the use of the feet in sowing and planting. In the sowing of seeds he thinks millions are lost annually through neglect of "firming" the ground around the seeds. During the past dry season, enormous losses were incurred by market gardeners and other cultivators of cabbages, cauliflowers, celery, etc., mainly because they persisted in sowing the seeds without taking the precaution to firm the soil by rolling. His own practice is, after plowing, harrowing and leveling the land smoothly, to draw lines by the "marker," which makes a furrow about two inches deep and a foot apart; after the man who sows the seed follows another who with the ball of the right foot presses down his full weight on every inch of soil in the drill where the seed has been sown. The rows are then lightly leveled longitudinally with the rake, a light roller is then passed over them and the operation is done. By this method his cabbage and celery crops have never once failed, and what is true of these seeds is equally true of all seeds requiring to be sown during the late spring or summer months. On July 2d, 1874, as an experiment, he sowed twelve rows of sweet corn and twelve rows of beets, treading in after sowing every alternate row of each. In both cases, those trod in came up in four days, while those unfirmed remained twelve days before starting, and would not then have germinated had rain not fallen, for the soil was as dry as dust when planted. The result was that the seeds that had been trodden in, grew freely from the start, and matured their crops to a marketable condition by fall, while the rows unfirmed did not mature, as they were not only eight days later in germinating, but the plants were also to some extent enfeebled by being partially dried in the loose dry soil.

The same season in August he treated seeds of turnips and spinach in the same way. Those trod in germinated at once and made an excellent crop, while those unfirmed germinated feebly and were eventually nearly all burned out by a continuance of dry, hot air penetrating through the loose soil to the tender rootlets. A large proportion of the blame often laid at the doors of nurserymen on account of selling dead trees, he attributes to the neglect of growers to compact the soil about the roots.

M. B. Bateham, of Ohio, obtains the same results by using a wheel-barrow half loaded. R. Douglas, of Illinois, uses a pounder for packing earth around trees. W. C. Strong, of Mass., deprecates the use of water when planting. He thinks it does more damage than good, especially on evergreens. Mr. Spaulding,

* See RURAL, April 19, for first illustration of this apple.

of Illinois, uses water when very dry. He watered his small evergreens this season and his loss was very small. He dug a small trench by the row, partially filled it with coarse manure and then applied water. R. Douglas had in former years moved evergreens during the entire summer. He found those which had been moved previous to Sept. 15th had done the best. He used water. He found the hotter the day the more rapidly they rooted. He would advise planting before the growth was made. S. B. Parsons agreed with Mr. Douglas, but had had good success in transplanting evergreens and deciduous shrubs in June and July by reducing them to a dormant state—removing the fresh growth. Mr. Manning preferred planting evergreens April 20th to May 20th. Mr. Strong would plant in August and wet the tops but not the roots. E. Moody, of New York, would plant May 1st to May 15th, and never expose the roots to the air. Mr. Parsons then followed with an address upon "the planting of trees in a landscape style," which of itself would fill an entire page of the RURAL, and which should be read by all horticulturists.

Thursday morning the Committee on Nomination of Officers reported as follows: For President, T. S. Hubbard, Fredonia, N. Y.; for Secretary, D. W. Scott, Galena, Ill.; for Treasurer, A. R. Whitney, Franklin Grove, Ill.; Executive Committee, T. S. Hubbard, of New York; D. W. Scott, of Illinois; S. W. Hoover, of Ohio; Franklin J. Davis, of Maryland; George B. Thomas, of Pennsylvania. The old list of vice-presidents was retained. The report of the committee was accepted.

MR. G. W. CAMPBELL, of Delaware, Ohio, gave an instructive address on

Grape Culture

That the purely foreign kinds—Vitis vinifera—cannot be successfully grown in this country, having been universally conceded, he said that we must now look for success to our best native or hybrid varieties, but he thinks that the great majority of hybrid seedlings between the domestic and foreign sorts will prove unsuited to general cultivation, mainly because whatever fine qualities they possess, are often, or always, accompanied by the same tenderness of vine, and consequent liability to disease, which renders the success of the foreign Grapes impossible. Rogers's Hydrids, though nowhere extensively used for wine-making, he considers among the hardiest of their kind. The Diana he believes is destined to occupy a higher place in public estimation than at present. Many Grapes that brought high prices ten years ago are now deemed worthless, such as the Iona, which proved to be a total failure with the average cultivator. A general misapprehension of the care needed, and ignorance of the proper treatment of the vine by many of those who engaged in grape-growing, were doubtless great causes of the failure. The fact that different varieties should have different treatment, some requiring long and some short training and pruning; that many Grapes can only be grown in soils and situations suited to their special characters and habits; that others need protection in winter; and that all kinds are seriously injured, enfeebled, and often destroyed, by overbearing, seemed to be either unknown or disregarded. Another minor evil, which has an injurious effect upon the business of grape-growing, is the persistent and unscrupulous pushing and sale of pretended new and remarkable Grapes, which in reality have no existence. Bottles containing the large, white foreign grapes preserved in alcohol, are exhibited to gullible purchasers under fancy and fraudulent names, with the assurance that they are new native varieties; and vines are sold at $2 or $3 each which are claimed to produce these Grapes, but which, if they ever bear, prove to be of the wild and worthless Fox tribe; or perhaps Concords, Ives, or whatever is most easily obtained or cheapest in the market. The "Empress" was the favorite name of this swindle a few years ago. This year it has appeared as "Conover's Seedling," accompanied by a fanciful engraving.

The most serious hindrances to American grape culture are mildew and rot, and he believes both these evils are measurably within the control of the skillful vineyardist. The remedy is the timely application of sulphur. How serious the phylloxera may prove cannot yet be determined; but it is at least probable that the Southern Grapes of the Æstivalis family, as well as the Northern natives, of Labrusca origin, will be able successfully to resist its attacks. The finer varieties of hybrid Grapes containing an admixture of the foreign Vinifera, are much more liable to be injured; but that even these *can* be grown, in favorable circumstances and by intelligent care, is proven by J. H. Ricketts, the originator of the finest collection of this class of Grapes, that has ever been produced. Every year he brings for exhibition specimens of the most beautiful hybrid Grapes, highly-flavored, well-colored and admirable. Much of his success is doubtless due to his position and to his skill and attention. But there are places equally as good, and the same care will produce like results. Successful and profitable grape culture is *possible* in nearly all sections, by means of careful selection of varieties suited to special localities, and by more careful and intelligent cultivation. To this end, only such varieties should be grown as are best suited to the soil, climate and location, selecting always the best with which we are able to succeed. It is nearly useless to plant any of the finer hybridized Grapes in the Northern States without pruning in the fall and protecting during the winter. The same may be said of the more tender native kinds.

The Lady Grape, he thinks, will prove valuable for an early white variety, especially for near market, as it is of better quality than other early kinds, and he believes it can be successfully grown wherever Concord, Ives, Hartford, and other hardiest Grapes succeed. It has not, so far, shown a tendency to rot, even when the Concord has been seriously affected. For some reason, the white seedlings from the Concord, including Martha and Eva, have been quite free from this malady. The Brighton Grape has been quite largely planted during the past two years. Whatever may be its good qualities—and he hopes they are many—it will not endure our severe winters without protection. The past two winters it has been killed to the ground, seeming to be little, if any, hardier than Diana Hamburgh, its staminate parent. Mr. Ricketts has now sent out his "Lady Washington," and Messrs. Hance & Son have also sent out the Highland Grape, which are regarded as two of the most promising of Mr. Ricketts's remarkable collection.

Miscellaneous.

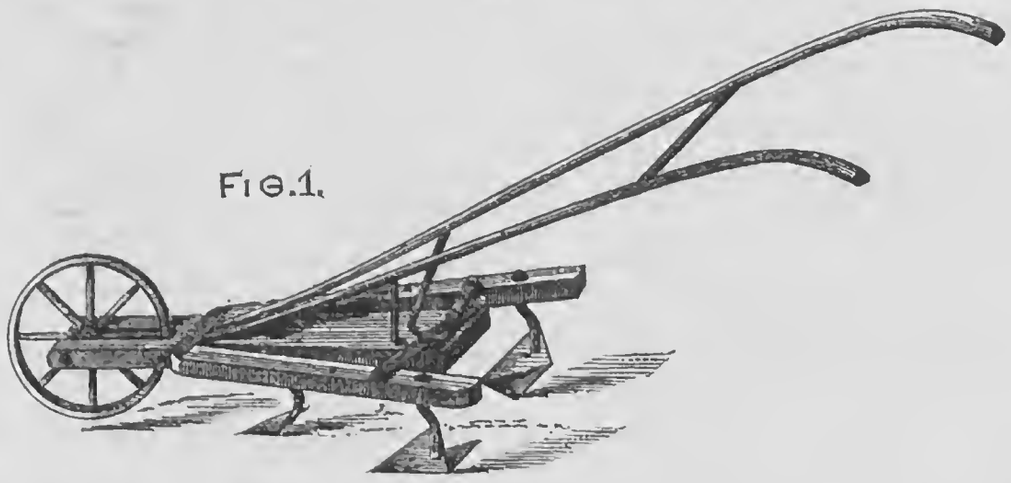
Then the committee upon the best method of disposing of nursery stock, in their report, gave some well considered suggestions to their nurserymen *confreres*. Next in order, Jonathan Periam made an excellent address upon the "Art of Horticulture in Civilization." Mr. Meehan's *extempore* address on the future of the nursery business, stated that $40,000,000 were received annually from the sales of nurserymen and florists, exclusive of the sales of those indirectly engaged in the business. Not one-third of this sum was derived from the sale of fruit trees, and such sales would grow less as the country advanced in wealth and refinement. The best sales are from ornamental trees, plants and flowers. In summing up his own remarks, he said that he wished it to be understood that the amount of money involved in the nursery business was much greater than those actually engaged in it had any idea of; that it was well worthy of a study of those business rules especially adapted to it; that it was a business that gave pleasure to thousands and pain to none, and that that part of it which dealt with the beautiful, rather than that which was merely the useful, would most assuredly grow in popular estimation, and that it was in this direction that those who were looking to the future prospects of the business should carefully attend.

Farm Economy.

FARM HELPS.

F. A. GULLEY.

IN growing the small vegetables in rows from 10 to 20 inches apart, the hand cultivator is almost indispensable. With it one man can do as much work as four or five men with hoes. The objection to many of the hand cultivators is that they cannot be run close to the rows of plants when first coming up, without covering them with dirt, and thereby destroying them. After using several of the cultivators sent out by different manufacturers, and having teeth of various forms made to order, we found nothing equal to the implement shown in the accompanying cut, Fig. 1. The merit lies in the shape of the two back teeth or shovels. The right-hand tooth is shown enlarged at Fig. 3.



The upright, a, is made of ¾x⅜-inch wrought iron, the upper part, c, forged round ½ an inch in diameter, and thread ent and nut fitted at upper end; below a burr, b, is welded on to form a solid shoulder to rest against the lower side of the cultivator frame, to keep it from turning when the nut is drawn down tight. The lower part, d, is cut from an old saw-plate, or from an old steel shovel blade, in shape like e, of which side f is seven inches, sides g g, 5½ inches each. It is bent at a right-angle at the dotted line and fastened to the upright, a, with two rivets. The lower end of the upright should be drawn down thin, the edges beveled and the rivets well headed down and filed off smoothly, so that neither dirt nor weeds can catch.

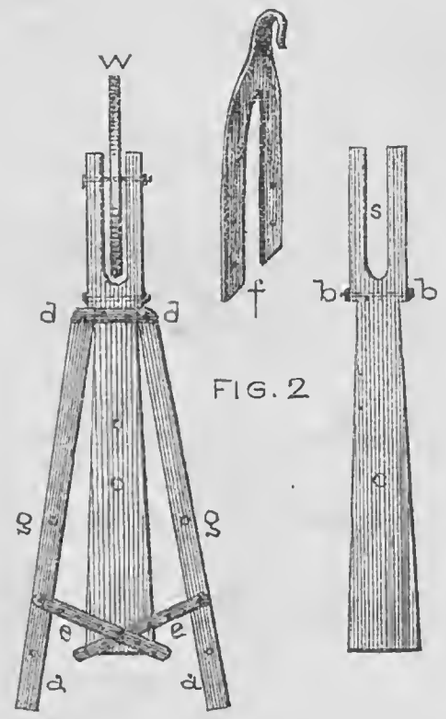


FIG. 2

The front point of the shovel, d, should be ¼ inch lower than the back part, to hold the tooth in the soil. The whole tooth is six inches in length from the shoulder, b, to the bottom of the shovel. The front tooth, Fig. 4, is shown in two parts. The upright, a, is the same as in Fig. 3, but longer; the shovel, b, is made of the same material as the others and riveted to the upright; it measures four inches across, and the point in front should dip ¾ of an inch.

The uprights are made to curve back so they will not be so liable to turn around as if they were straight. In cultivating small plants, the front points of the back teeth should be set a little out, so that they will tend to throw the dirt from the row. In clean, mellow soil, this cultivator can be run as fast as a man ordinarily walks, within one inch of plants just coming up, without throwing any dirt on them. These teeth can be made by any blacksmith and attached to many of the hand cultivators in use, much to their improvement.

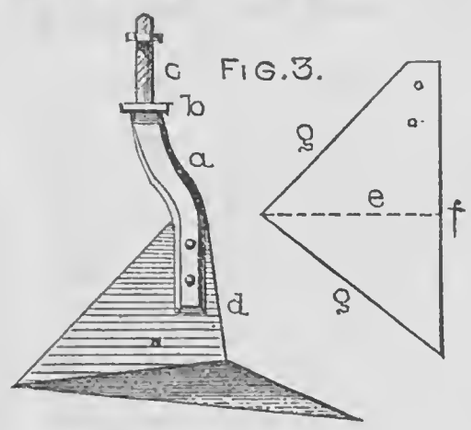

FIG.3.

I have just made a cultivator like Fig. 1. The wheel and handles were taken from an old seed drill; the frame, Fig. 2, was cut from 1½-inch oak plank; the center piece or body is shown at c, with ¾-inch bolt at b to prevent splitting. It is 30 inches in length; the slot s for the wheel is eight inches, and wheel w, 12 inches in diameter. The side-pieces a, a, are 1½-inch square, two feet long and attached to the body at *d*, *d*, by an iron plate one-eighth of an inch in thickness above and below with two bolts through the plates and body, and one through the ends of the side pieces. The adjusting irons, e, are 3-4x3-16 of an inch with holes ¾ of an inch apart. They are bolted to the arms a a, and there is a bolt through the body c, and both irons have a nut on top. By removing the nut the side pieces a, a, may be set at different widths. When the teeth all rest on the ground, the wheel should be one inch above; if level, the front tooth would ot run deep enough.

At Fig 5. is shown a better way of attaching the wheel, to run deep or shallow. The block b, in which the axle turns, is fastened to the body-piece C, with two bolts; the bolts may be taken out and the blocks put on top of the body-piece C, raising the wheel two inches, or the axle, if not fast to the wheel, may pass

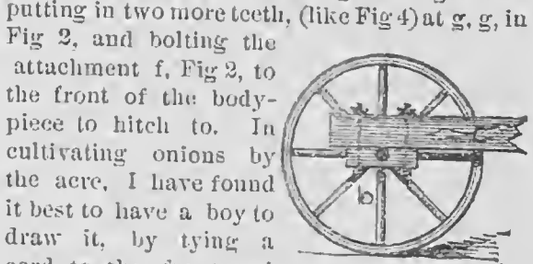

FIG. 4.

through the body piece as in Fig. 1. A blacksmith made the three teeth for 60 cents and charged 40 cents for the other irons and bolts. I made the wood-work in half a day, and I have a cultivator superior to those sold at all the way from five to ten dollars.

The great objection to growing roots with many farmers, is the cost of cultivation when the plants are small. The ordinary cultivators cannot be used or, at most, but one or two teeth can be run along in the center between the rows, leaving a great amount of work to be done with the hoe by hand. By having two teeth made like Fig. 4, doubling the size, they may be attached to the ordinary low-frame horse cultivators, and can be run close to the row, or a cultivator, like Fig. 1, can be made for this purpose, making it longer and putting in two more teeth, (like Fig 4) at g, g, in Fig 2, and bolting the attachment f, Fig 2, to the front of the body-piece to hitch to. In cultivating onions by the acre, I have found it best to have a boy to draw it, by tying a cord to the front end of the cultivator, and a man to hold it and push by the handles. I have had men average 16 miles of rows per day for a week with this cultivator. Fig. 3. represents the right-hand tooth, with the flange of the shovel turned to the left or center between the rows. The left tooth would have the flange turned the other way.

Farm Topics.

FARM NOTES.

PORK.—Let all who doubt that pig pork is preferable to old hog pork, test both, and I believe they will always use pig pork in their family, when possible, and sell the old hog pork. The nicest as well as cheapest pork a farmer can make, is that obtained by feeding pigs all they will eat until six or eight months old, when they should be butchered.

ROOT CROPS.—I am convinced that root crops receive far less attention than they should. I have always found they were a profitable crop to feed to calves and sheep, and have seen their good effects on other farms, when fed to cows. I would say to every farmer who has not been in the habit of raising root-crops for his stock: "Try a piece of ground to roots, this year, and next winter feed them to your stock, and it is probable you will ever afterward continue to raise them."

YIELD OF CROPS.—Every farmer needs to study, and study hard, too. When we consider what the present yield of our crops is, and that they may, by proper selection of seed and judicious cultivation, be doubled, is it not a little strange that so few farmers give their attention to this matter, and labor both with brain and muscle to accomplish this result? We, as farmers, must till our land better; cultivate only as many acres as we can make rich with manure, and take special pains in the tilling of it. The soil cannot be mellowed too much. The basis of good farming is good plowing, for if you do not plow well you need not expect good crops, no matter how much manure you apply; and after the ground is plowed the harrow should be used twice as much as many use it. I have seen some, when fitting ground for corn or grain, harrow but once, and then leave a strip untouched by the harrow, nearly every time in crossing the field. This, of course, is not the practice of a good farmer. Good cultivation will make up in part for a light dressing of manure.

STAY WHERE YOU ARE.—The plan practiced by many of selling out every few years and going to a different place, is a very bad one. Before purchasing a farm, a man should look around with his eyes open and find one that he likes; and when he buys and moves onto it, it should be with the intention of remaining. If he, at length, finds some things that do not suit him, as he will be likely to, he ought to try and bring them as near his ideas as he can, and then make the best of the matter. One farm cannot have every advantage, and the man who is constantly seeking for one that suits him in every particular will, in time, discover that he is after that which he will never find. A farmer cannot sell out and buy again

without a loss, in one way or another, even if he moves but a short distance. Remember the old proverb: "A rolling stone gathers no moss,' and stay where you are, on the old homestead, or near it, and take an interest in the Grange, or Farmers' Club, try to build it up, improve and beautify your farm, and try to have your neighbors do the same. Cultivate sociability among neighboring farmers, and try in every way practicable to elevate your occupation, and you may, if you will, be happier and better off than if you change for some new location. F. H. D.

Steuben Co., N. Y.

HINTS.

Raise Your Own Seed.—In your vegetable garden reserve room for a row of seed plants. Every gardener or farmer should raise his own onion, parsnip, turnip, cabbage, salsify and beet seed as well as save seed from his choicest cucumbers, squashes, tomatoes and melons. Gather them in paper bags of a size to suit the quantity desired, and then at once label before storing them. The room for seeds enough to supply the needs of a large garden, will hardly be missed, and the culture is not at all troublesome. In this way an annual outlay of five or ten dollars is saved and good, fresh seed made a certainty.

Hardiness.—A great mistake is made by many persons in planting their tender shrubs and trees with a southern exposure. All pains should be taken to protect tender trees from the winter sun. Give them, if possible, a northern exposure, especially to the north of a hedge. The Apricot thrives with me under the above condition. The Rhododendron, also, and the Quince, the Peach and a few of the deciduous trees that are generally pronounced not hardy, do well. The Persimmon, grown from seed, has stood six winters. Peaches bear well occasionally, which is all we can expect for this latitude. It must be borne in mind, at the same time, that a shelter from both the north wind and the southern sun is a still better protection, especially for Quinces. A good supply of arbor-vitæ or hemlock hedges will furnish the needed screens. A few choice trees can be saved by binding hemlock boughs around them in October or November. In addition, keep weak shoots cut out in summer; force all the vigor of the tree into a few well ripened limbs, and winter will not be likely to do much damage. E. P. Powell.

Oneida Co., Co.

Field Crops.

MANAGEMENT OF ROOT CROPS.

A WESTERN FARMER.

Many farmers may have been induced, from the favorable reports in your columns regarding root crops, to plant an acre or two, or some may have made the common error of jumping into this, as a new thing, over their ears, and are now floundering in an abyss of difficulty. The difficulty will be weeds. These are the bugbear of the root-grower; and if they are once permitted to get the upper hand, the outlook for a crop is disheartening. But weeds must not be permitted to grow; and if they have been allowed to get ahead of the plants, the finger and thumb and a crooked back are the only resource. And these must not be used grudgingly, but perseveringly until the crop is cleaned. Beets and mangels start slowly, and at first the growth is slow. The common danger, hard to avoid, is the planting too deep, and if the seed is down more than one inch below the surface, or the soil is cloddy, many plants do not come up in the rows for a month after the sowing. By that time the weeds are well started.

The first precaution, which is still timely for the sowing of sugar beets, ruta-bagas and turnips, is to run the rows in conspicuously rounded beds, as shown at Fig. 1. These are made by running back furrows, thirty inches apart, and plowing other furrows to these, or by dragging the ground with a plank ten feet long, divided, as shown at Fig. 2, into rounded hollows, each thirty inches apart from center to center. Then the seed furrow, or the drill, may be run on the crest of each ridge, leaving the row very distinct. Then there is no need to wait until the plants are above the ground to use the cultivator. Otherwise a good plan is to harrow the ground repeatedly, having plowed it in time to do this, and have the final harrowing made crosswise of the direction in which it is intended to make the rows. Then, in using a hand or a horse planter, the rows are made very conspicuously across the harrow marks, and the spaces between can be cultivated at any time close up to the rows, and the young weeds killed. As soon as the plants are above ground, I run a plow as near to the rows as possible, throwing the land away from them, as shown at Fig. 3.

This is the best time to thin out the plants, and it is done very rapidly by a man who walks along the row and chops out the intermediate plants, leaving bunches or single plants about 12 or 18 inches apart. The rows appear as at Fig. 4. After the hoeing a boy follows and takes out all the plants except the most thrifty one at each place left. Some talk of transplanting beets or mangels. I never found one transplanted to be worth the trouble. I would rather prepare a bed of cabbage plants in season and put one of these in every vacant place, than take the trouble to transplant a beet; or I would drop a few seeds of rut-baga or Gray-stone turnip, and let these occupy the room.

Fig. 1.

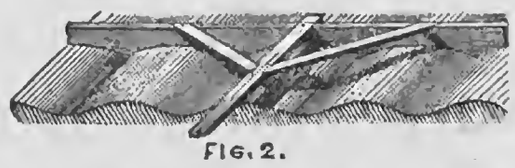

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

I now take the opportunity to throw a little fertilizer, two hundred pounds of blood guano, or of finest ground bone flour, in the furrow; and as soon as this has been done, the soil is thrown back again. To scatter the soil and make it fall loosely in the row, I tie a piece of rope about the mold-board above the heel of the share, and the earth caught by this is broken up and scattered, and does not turn over in a compact mass. The rows then appear as at Fig. 5. After this a common cultivator, or one with scrapers, may be advantageously used to loosen up the soil and keep it clean until the rapidly growing leaves cover the ground or shade it sufficiently. The crop is then safe until the time comes to gather it, and this work is sufficiently important to be treated of by-and-by specially.

Miscellaneous.

THE WORK FOR AGRICULTURAL COLLEGES

PROFESSOR S. M. TRACY.

In a recent number of the Rural an article urged that agricultural colleges should be made experimental stations, and that tests for the best method of culture for various crops, the best method of feeding and breeding stock, the culture of fruits, etc., should be made a part of the college work. The idea is an excellent one, and one that ought to be carried out much more fully than it is; but, until farmers as a class can be made to see and feel the necessity for such work more clearly than they have ever yet done, there is little hope of very much being accomplished in this direction. Strange as it may be, the greatest opposition to agricultural colleges and experiment stations comes from the farmers, and not from the lawyers, brokers, merchants and other non-farmers, who, as a rule, are men of more education than are the farmers.

Properly managed, agricultural colleges might be of incalculable benefit to the farmer in at least two ways: one is by giving him an education, the general culture of which will do much to make him respected and influential among his neighbors, while the technical part will benefit him financially by enabling him to conduct his farm scientifically, and therefore successfully—for successful farming is scientific farming; the other way in which the agricultural colleges may benefit agriculturists is, as suggested by the article referred to, by making them experiment stations. The science of farming is based almost entirely upon experiment, and experimental work is both difficult and expensive, and must be continued for years before it can be of much real value. Experimental work, as it is too often conducted, is worse than useless. The experiment is usually closed within a few months, or a year at most, and the results are announced as definitely settling the question at issue, and by far too many accept these results and act upon them without knowing anything of the peculiar circumstances under which the experiment was made. The culture which is most successful in particular seasons, on certain soils, and under a certain amount of rainfall, may be an entire failure when any one of these three circumstances varies. Reports of farm experiments should never be accepted as being of any value whatever, excepting so far as the circumstances under which they were made are given; the reliability and ability of the party making the experiment should also be considered, and the greater the length of time the experiment was continued and the more widely varying the circumstances under which it was made, the more valuable and reliable does it become.

Very few farmers have the means, and still fewer of those who have the means have the inclination for long-continued experimental work. Those connected with the agricultural colleges *ought* to have the ability to do this work, and it is only by doing such work that they can, to any great extent, benefit the thousands of farmers who are unable to enter the class-room. The endowment given by Congress was "for the benefit of the industrial classes," and the comparatively small number of students in the colleges is a very small proportion of these classes. Some of the agricultural colleges are doing good work in this direction, but most of them are laboring under the disadvantages of insufficient or unavailable endowments and meager appropriations. One who has never tried it has no idea of the expense and labor necessary for experimental work which will really be of any actual value.

To give a single example: Suppose it is desired to test different varieties of wheat, the ground must be selected carefully, to have it as even as possible; the whole ground should be plowed without rain, and the whole crop sowed on the same day, and several strips or plots of some one variety should be sowed in different parts of the field to furnish means of correcting any inequalities arising from differences in the soil. When harvested, the crop must all be weighed, and in thrashing, great care is necessary to keep each variety by itself. A report of the trial should include: the character of the soil; the crops raised on it in previous years; the manures used and the mode of applying them; the method of preparing the ground; the date and manner of sowing, and the amount of seed; the ability of each variety to withstand frost, drought and rain; the date of ripening; the weight of straw and grain; the weight of grain per bushel; the character of grain, yield per acre and character of the season. To make the report complete, the grain should go to the chemist, that we may know which varieties are of the most value for flour. The work will then be duly commenced, for it should be continued for years, and the true experimenter will not be satisfied without selecting and hybridizing seed, and endeavoring to obtain new varieties of still greater value.

This is work which, from its very nature, cannot be directly profitable, and which we cannot expect to have conducted without governmental aid. At the agricultural colleges are men fitted for the work, many of whom have been fitted for it by years of training in colleges and on the farm, and the State and National governments cannot devote the necessary money to any other work which will be so advantageous to the whole country as by supporting an experiment station at each agricultural college.

Columbia, Mo.

ABOUT BARNS.

It seems to me that your correspondents have succeeded in knocking all preconceived notions of the average barn-builder into "pi," with high barns and low barns and so-called axioms. It seems to me that some of us who use barns and understand our needs should briefly state our requirements, and the kind of barns we have built, are building or hope to build, thereby throwing some practical light upon the subject.

Now in regard to the size of the barn: my preference, for mixed farming, is a large building, with basement, if the site is suitable; if not, then a two-story structure, with a driveway graded as wide as the floor, protected by walls which curve outward as they reach the level ground. The bank or graded drive-way should be connected with the barn floor by a bridge. The basement, or lower story, as the case may be, is to be used for stabling, tool-storage, root-cellar, etc., etc. With proper elevation, no floor is needed in this part of the building. Stables for sheep or horses are much better without floors; and for cattle, with proper care in paving or grouting, or, what is perhaps better, by using a mixture of clay and gravel tamped hard, there will be no need of wooden floors. The upper part of the building is so largely varied to meet the needs of the owner that I will not particularize, only saying that it should be at least 20 feet from sill to plate, and not to exceed 30 feet under ordinary circumstances.

The talk about the necessity that the timbers for buildings should increase in proportion to their hight is true, but not practical; nor will it apply to barn-building at all until the hights I have mentioned are exceeded. The expense of framing is the same, excepting a few dollars' worth of labor in framing girths and braces. The expense is but little for timber until this hight is exceeded. The expense for outside covering is easily computed, and is but a small part of the cost of the building, while the saving in foundation (which should be, in all buildings thoroughly built, sunk below frost, raised above the action of damp, protected by drains, etc.,) is large; so also is that of the roof, as has been estimated. If a larger building is needed than can be conveniently placed under one roof, add wings, or build another barn, but do not build a number of small barns to annoy you while you live to use them. E. L. M.

COAL ASHES AND CURRANT-WORMS.

In looking through your issue of June 14th, under the heading "The Garden," I find two articles disconnected, viz., "Death to the Currant-Worms," and "Coal Ashes." Let me connect the articles.

First, my currant bush or bushes are not planted under a fence, but ten feet from it. Second, early in the spring, i. e. before the leaves start, I cut out all old stalks; clean all dirt and grass from the roots, throw the refuse away as far as I can with a shovel, cover the roots with fresh dirt, and the dirt with manure, and the manure with from two to four inches of coal ashes.

I have followed this plan for years, and when the workmen obey orders, I am never troubled with currant-worms. When they "slight the job" I get a few currant worms, otherwise my currants are very fine. I don't mean to advise a little pile of coal ashes close to the bush, but I do advise that the ashes should be spread all over the ground as far as the bush will extend.

Every family that uses coal can save enough ashes for their own bushes, but to those who have, say, twenty acres of Currants, more or less, I say put on the coal ashes, if you can get them. Plow under the old ashes and you kill the eggs. It may take two or three years to kill all the eggs, but stick to it and you will conquer. D. K. Barker.

WHAT OTHERS SAY.

Budding Roses.—The editor of the Gardeners' Monthly says that the rose season reminds him to say that he is almost sorry they are so generally grown on their own roots, for it was such a nice employment for many people, not professional gardeners, to bud them on the Manetti stock. But the suckers from these wild stocks came up, and in time so weakened the grafted part that it soon died. Florists would say that amateurs should keep the suckers cut away; but it is not easy for amateurs to distinguish one from the other. Yet we hope the pleasant practice of budding Roses will not fall into disuse. Any hardy kind can be used for a stock, and one may have a dozen or more kinds on one plant in this way. In budding Roses, or indeed in budding any kind of plant, strong, healthy stocks should be selected, and above all, strong, healthy buds. It is chiefly when weak stocks or weak buds are used, that failure follows. On a recent visit to Boston, he saw especial reason to refer to this matter of budding Roses. A person was complaining that his fine English imported Roses—beautiful a few years ago—were "running out," and he doubted if the Boston climate was good for the Rose; but the editor found the "running out" merely meant that one-half the plants were now nothing but the Manetti, on which the English now bud extensively. The stocks had outgrown the grafts.

To Destroy the Cabbage-Worm.—Mr. O. S. Bliss tells the N. Y. Tribune that the best thing he has ever found for the cabbage-worm is to dose it with pepper from the little four-ounce boxes so common in the stores nowadays. It seems not to be a sure cure, but he has sometimes saved a crop by it. Instead of hellebore for currant-worms he uses the root of the false hellebore (Veratrum viride), a plant found in all our low meadows and fields and commonly known here as Indian Poke, sometimes as wild hellebore or black hellebore. He gathers in a few minutes roots enough for the year, and throws them upon some high shelf to dry.

When the worms put in an appearance on the currant bushes or rose bushes, he puts a root or two into an old three-quart fruit can and sets it on the back of the stove for a few hours, when with a wisp of hay or an old whisk broom, he sprinkles the bushes on a dry day. It is a little trouble, but no work, and does not cost over a cent a bush to keep the whole crowd of leaf-eaters in subjection.

Best Varieties of Fowls.—Professor A. J. Cook says—we do not know what publication is entitled to the credit—that he has decided that for both meat and eggs no variety ranks higher than the Light Brahma. Possibly the Plymouth Rock ranks nearly as high. The Brown Leghorns he has found to be perfect non-sitters. They are admirable layers, except in cold weather, when he found them inferior to the Light Brahmas. The Leghorns mature quickly, when they weigh three to four pounds, and are, he thinks, almost useless for the table. They are wild and intractable. A fence five feet high is Brahma-proof. As much cannot be said of one three times as high if the word Brahma be replaced by Leghorn. He cannot recommend the Brown Leghorns, though he has a flock for sale.

FREIGHT INJUSTICES.—At a recent meeting of the Farmers' Alliance, as reported in the Rural Home, railroad monopolies were talked about. One member said he did not believe there would be sufficient resistance to railroad oppression till it had fairly strangled the people. Another added: "Shall we control the railroads, or shall the railroads control us? Vanderbilt has control of all the railroads leaving Chicago, and running through this State. The chartered corporations have the statutory rights, and we are told that there is no other way but for the people to submit. Is that so? There are the people on one side and the corporations on the other, and the people can beat, if they *will* it."

UPLAND CRANBERRIES.—A year or two ago there was a great ado made about the cultivation of Cranberries without the assistance of marshes or water, says the Germantown Telegraph. Very careful directions were given how it was all to be done; how it would avoid the insects, diseases, etc., to which the bog Cranberries were subjected, and so on. Of course there was money to be made in this. There were plants to be sold, and we suppose that a good sale was made; for by the time the fraud could be discovered there were no more offered to be sold. At least we do not notice that such was the fact. Cultivating Cranberries on upland and Whortleberries in gardens are about on a par.

STRAWBERRIES.—The Indiana Farmer gives a report of the proceedings of the Montgomery County (Ohio) Society. Dr. John A. Warder said he raised berries to eat, not to sell, and he preferred the Burr New Pine above all others. It may not fill the eye, or have good market qualities, but it is early, and fully an inch in diameter, large enough for anybody of ordinary-sized mouth. "For a Strawberry for home consumption, give me Burr's New Pine." Mr. Ohmer called the Crescent Seedling "The Lazy Man's Strawberry." He says it is "an easy grower, needing little culture."

POTATO WATER.—The Scientific American says that an immediate and effective remedy for lice on cows and other cattle, also for ticks on pigs, is to wash the affected parts with potato water—water in which potatoes have been boiled.

CATALOGUES, &c., RECEIVED.

OUR readers know of Mr. J. T. Lovett, the enthusiastic and reliable small-fruit cultivator. He has favored the RURAL with a number of articles upon various small fruits, which have shown how carefully he observes and records the new facts which in this pleasant occupation are ever presenting themselves. We speak of Mr. Lovett at this time merely to say that he is now sole proprietor of "Monmouth Nurseries" (Little Silver, New Jersey), to which, we understand, he proposes to give his undivided attention.

The Poultry Yard.

POULTRY NOTES.

Some farmers think it does not pay them to keep poultry. Their hens do not lay, and they are wandering all over the farm, scratching up corn, tangling the oats and wheat, destroying the garden, etc. Of course this does not pay him. But let us take a look at his barnyard. In one corner stands his poultry house—if such you could call it—which consists of a little shanty 6 by 8 feet square and about 3 feet high on one side and 4½ feet on the other. He keeps about 100 hens, with one rooster, which must either be huddled together in this small pen or roost out-of-doors on the coldest nights we have. The manure is two feet deep underneath one or two cross-pieces for the hens to roost on. The roof is rotten, and part of it fallen in. Here and there lies a dead hen, which died either from some disease, from exposure to the weather, or from starvation, as he never feeds his hens anything—"it don't pay," you know. What water his hens get they drink out of a hole in the barnyard, which contains liquid manure, which is going to waste the same as many other things on his farm. This much you could have guessed, as any man that will not take proper care of his chickens is slack in his other work. There are no places in which the hens could lay, even if they would under the circumstances. I am sure of one thing, that is, that poultry *does* pay here at "Cherry Dale" farm, and I think they would on any farm if managed the same as here. Our chickens are supplied with water the year around, and fed night and morning. We always try to keep egg shells for our chickens to eat. We have a good, roomy, and clean poultry house, and always have plenty of nests filled with clean, bright straw. We find our hens lay a great deal better when they have a change of food every week. As soon as we find a hen that wants to sit, unless we want her for that purpose, we shut her up in a small coop, water and feed her regularly, and in a few days she will come out and go to laying.

CIRCULATION OF MOISTURE IN THE EARTH.

S. RUFUS MASON.

HEAT and cold are the two principal agents producing the phenomena of life, not only of animal life, but also of vegetable life, as well as that pre-existing condition of the elements which induces animation in creation. Water is an extremely sensitive fluid, never for an instant in a state of rest, and so easily affected by heat or its absence that it rises and falls, ebbs and flows in the soil almost as promptly as the atmosphere does upon a fitful summer's day. The ill effects of stagnant water—so-called—are well known; it poisons the air, the soil it lies upon, the vegetation near it, and the very animals compelled to breathe the vitiated atmosphere about it or drink its fetid nastiness. But it is not stagnant in the true meaning of the word; it still rises by day and falls at night, although it does not ebb and flow. It has really become dead water—in contradistinction to living water—because it has no motion over its bed, which tends to refresh it by constant mixing with the atmosphere. We have here the secret of pure water, as water deprived of constant accessions of fresh air, becomes foul and decays. Although water in the soil seems, at first thought, to be too far removed from the atmosphere to feel its influence, yet it will be found extremely sensitive to it, and under proper conditions more will readily mix with air, than when in large bodies on the surface.

The internal heat of the earth tends to expand the water in it, which thus by its heat and its consequent loss of gravity, rises toward the surface. This vapor, mist or exhalation is probably invisible, but is nevertheless ample in quantity to permeate the stratum of cultivated soil, where (especially at night) meeting a cooler temperature, it is partly condensed, just enough to act as a solvent to the constituents of the soil, and thus serve to prepare plant-food. Changes of temperature in the atmosphere serve to accelerate or retard this action, and between the earth's internal heat, and the sun's heat applied to the soil externally, well cultivated soil can never become *sour*. The only mode by which soils can become sour, is to so neglect them that circulation is checked or totally stopped. When the exhalation arising from internal heat is so great that it cannot all be condensed in the soil, but a part rises into the air, it is then caught by a cooler atmosphere and is at once condensed into water, which collecting on herbage and objects lying near the surface, forms dew.

This is a consequence of cold, and in opposition to heat, drives down whatever heat forces up. Heat acts always in opposition to gravity; cold always in favor of it, and these two powers incessantly in action, maintain a constant circulation of water, moisture, vapor or exhalation in the soil, according to their respective thermometrical differences.

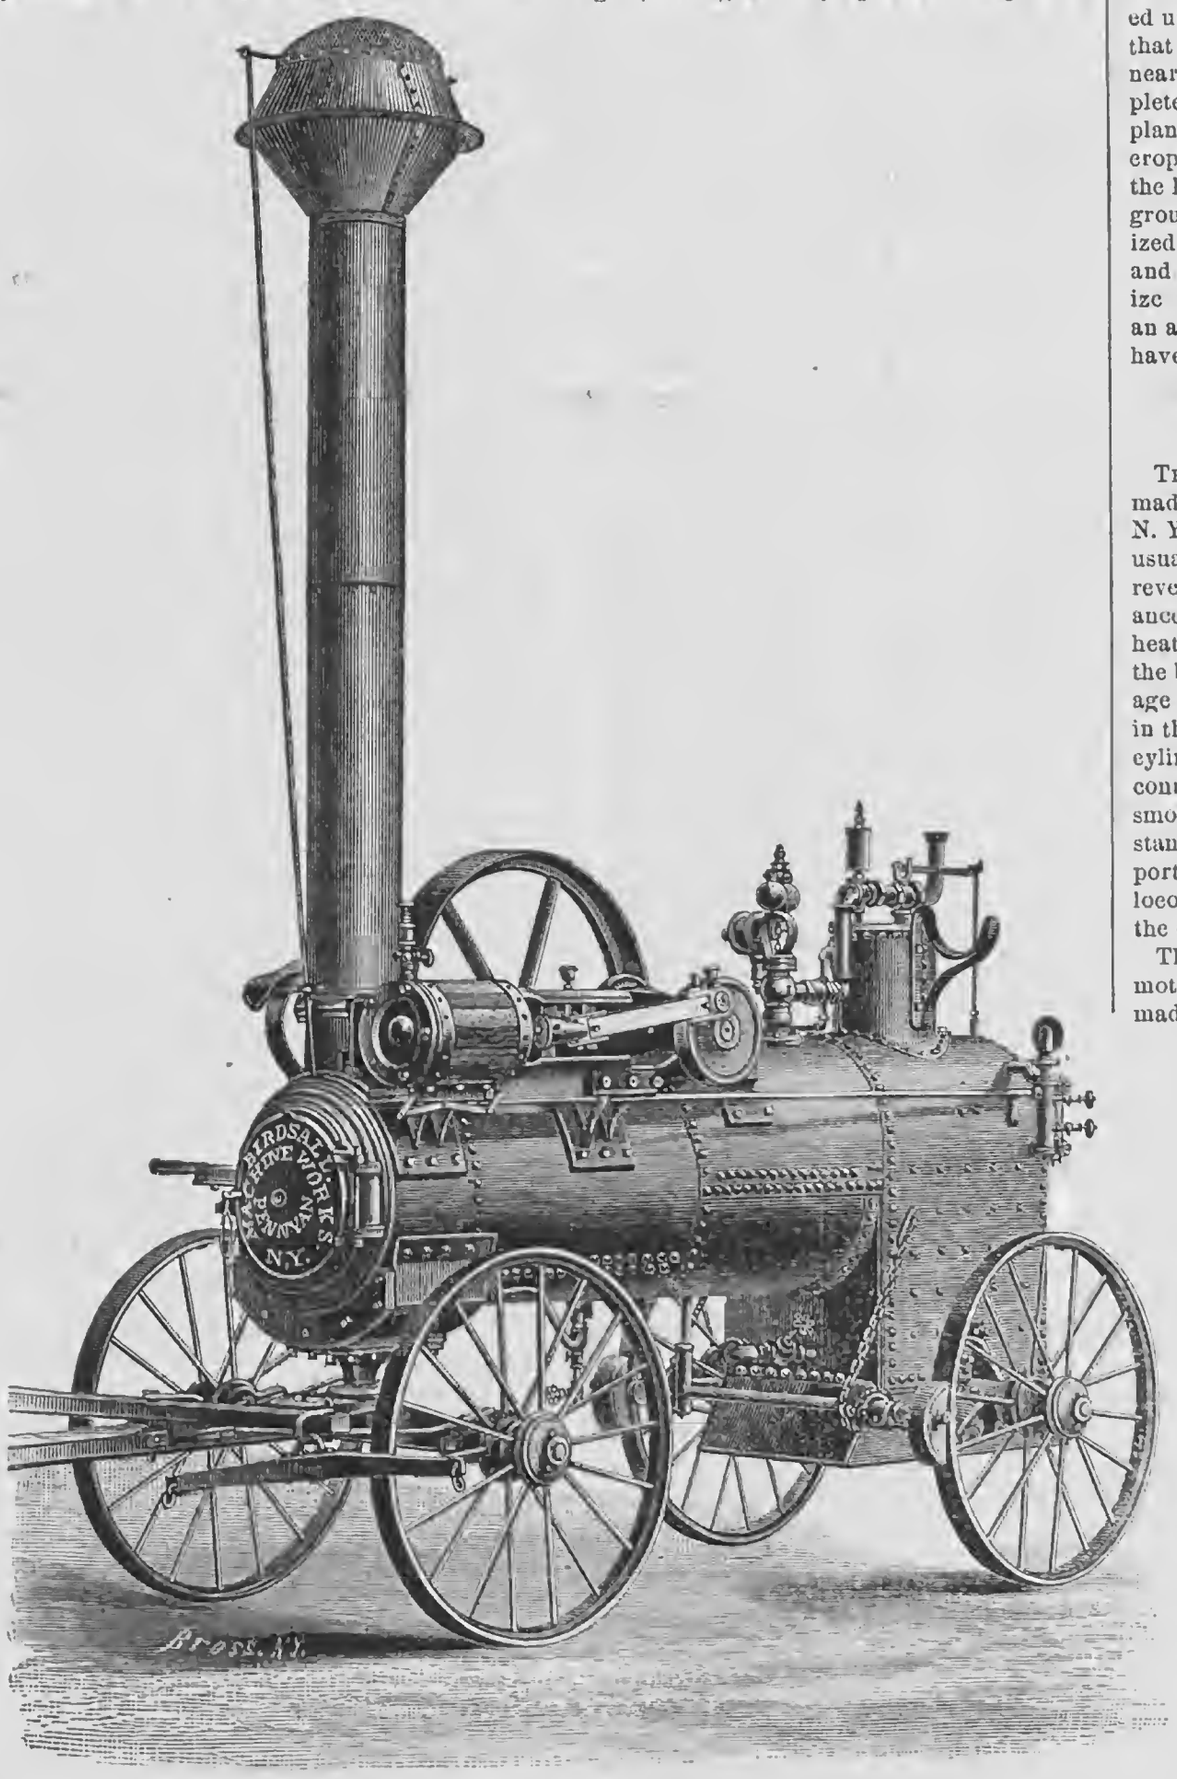
Dodge Co., Neb.

Industrial Implements.

THE WESTINGHOUSE ENGINE.

THIS Engine is comparatively new in many of its features. It is capable of driving the largest grain thrasher, and its actual weight is not more than 3,800 pounds. This of itself should attract attention, because it is many times a very anxious question how to move large machinery, especially in hilly sections of the country or when roads are in bad condition. To make one of so light a weight as that mentioned herein, there must needs have been some modification of the customary methods of construction, and these modifications consist of, first, a naturally reduced weight in the boiler, which from its peculiar construction retains abundant strength and has an ample area of heating surface; next, a quick-moving engine, having all its proportions adapted to the work required. The boiler of this engine will naturally be classed as an upright, but its interior construction is different from the vertical boilers. The tubes, instead of being vertical, are horizontal, and so arranged that the water circulates through them, and thereby present a large heating surface acting upon a small quantity of water. The engine has a novel balance valve, which seems to be almost entirely free of friction, and the whole of the running parts lie very low upon the truck, so that the engineer can have a full view of the entire engine at all times, and can have ready access to all the parts requiring his attention.

Westinghouse & Co., of Schenectady, N. Y., the manufacturers of this new engine, are also preparing to manufacture their Combined Clover and Grain Thrasher, on a larger scale than heretofore. The long-continued monopoly which has controlled the production of clover machines having two cylinders, which has been the source of so much vexation and litigation during the past eight years, seems likely to come to an end with the expiration of the patent.



THE BIRDSALL ENGINE.

THE SYRACUSE CHILLED PLOW.

REPORT FROM THE RURAL EXPERIMENT FARM.—Last March we received from the Syracuse Chilled Plow Co., of Syracuse, N. Y., one of their full-rigged, two-horse plows, with a request to thoroughly test and report our opinion of it. In our locality the farmers are very conservative, and have held steadfastly to the common, cheap plow, so that the advent of the "Syracuse" excited quite an amount of curiosity which culminated in its traveling about the neighborhood and being extensively used. It has made warm friends and converts. Its performances have demonstrated its superiority, and shown that it is in every respect a cheaper plow for sixteen dollars, than a dozen of the old-fashioned concerns at a quarter the price.

The thoroughness of the work performed, the ease of draft and handling and solid construction are the merits that are most apparent. We put it into a pasture that had been in grass nine years. The sod was very tough, but the plow went through it handsomely, cutting a clean furrow slice, and turning the furrow so thoroughly that all the grass was plowed under perfectly. Again it was put into sod that was overgrown with grass and daisies nearly a foot high, but this growth was completely turned under and covered. Corn was planted on this plot, and now that the growing crop requires working, it is found that only the hoe need be used. The plowing left the ground in such an excellent, perfectly pulverized condition, that it is uncommonly friable and free from grass or weeds. We particularize these instances as we consider they make an admirable record for the "Syracuse." We have expended nothing for repairs.

THE BIRDSALL ENGINE.

THE very excellent illustration of the engine made by E. M. Birdsall & Co., of Penn-Yan, N. Y., shows some decided departures from the usual manner of construction. The cylinder is reversed, throwing the crank-shaft and balance-wheel near the middle of the boiler. The heater is directly under the smoke-box end of the boiler, and is arranged to permit the drainage of every pipe, elbow connection and bend in the feed, in cold weather. Being near the cylinder, too, it receives the exhaust by a short connection and discharges directly into the smoke-stack. It also serves to make a substantial attachment to the front axle and supports the boiler saddle-wise. The boiler is of locomotive pattern, but differs somewhat from the ordinary portable farm engine.

The fire-box end is what is known in locomotive practice as the wagon-top form, being made with the sheet which forms the shell of the fire box several inches higher on top than the tube-shell, connecting with the latter by a taper waist, and surmounted by a steam-dome, which together form a large steam and water space. The fire-box is provided with rolling grates, which are actuated by a lever outside for cleaning the ashes. The ash-pan is provided with a draft-door at either end, in order that adverse winds may be guarded against.

The cut gives a very clear illustration of the manner in which the cylinder and frame are attached to the boiler. The design of the frame is of the truss pattern, giving rigidity and strength, together with symmetry and beauty of proportion. It is all cast in one piece, comprising the cylinder, steam-chest, elbow-pipe connections, guides, crank-shaft box, valve-stem guide, and bracket supports. It is attached to the boiler by broad, heavy brackets, the one at the cylinder end being secured to that part of the sheet which forms the smoke-box, and hence is not liable to cause leaks in the tube-sheet by the bolts working loose.

The various parts of the engine are conveniently accessible, and it is seldom that we are called upon to inspect a piece of mechanism that has been so carefully worked out in detail with a view to encompassing worth, strength, economy and finish. The circulars sent on application are fully explanatory and well illustrated, giving the reader a very clear conception of the engine.

Everywhere.

RURAL SPECIAL REPORTS.

MASS., Monument, Barnstable Co., July 1.—Many people think that Cape Cod is a sand hill; I wish they were here now, for they would change their minds. We have had nice rains and everything looks green and beautiful. There are some very good farms here, and nearly every one has at least a good garden, while the love of flowers grows more and more every year, even the very poorest houses having their little flower beds by the door, and some having very handsome gardens. A. W. B.

NEW YORK, Fluvanna, Chautauqua Co., June 29.—The weather is delightful; showers frequent; mercury from 60 deg. at 6 A. M., 90 to 92 deg. at 2 P. M., and 70 to 72 deg at 8 P. M. Crops of all kinds are looking well. Wheat is fine; grass about three-fourths of a crop, and in some places above an average. Corn is rather small, but of a good color and growing rapidly. Oats, barley and spring wheat are above an average. Potatoes are looking fine. We have had new Early Rose potatoes for dinner; also green peas—McLean's Little Gem. Turban squash vines are four feet and looking unusually fine. Early onions are beginning to ripen. Fruit prospects are good. We have plenty of old apples in the cellar in fine condition, and the new ones are large enough for sauce. Orchard-grass is cut and in the barn. Celery is large enough to begin to hill. Beets and turnips are unusually fine. Cabbage is good—no moths or worms appeared up to date. I shall start the plow for buckwheat and sweet Russian turnips on the 30th. Shall put turnips in drills, rows two feet apart, so as to do the work with a cultivator. The new potato, Beauty of Hebron, is very promising; shall keep all for seed. Butter very low—12½c. per pound; pork advancing a trifle—5½c.; beef, 5c.; sheep scarce—no sales. H. A. W.

N. Y., Croton, Del. Co., June 30.—We had a very long and severe winter in this locality, the snow laid on until late in the spring, and consequently farmers were very late in getting at their spring's work. The ground was dry and in good condition for sowing soon after the snow went, and remained so through seed time, but the weather being cold and with very little rain until recently, was not favorable for growth of vegetation. The prospect for the hay crop has been rather discouraging, but the numerous rains in the fore part of the month, together with the warm weather, made all crops grow lively, and our farmers are looking more cheerful than they have done, though with the present prices of butter, most of our dairymen get "the blues," especially such of them as are in debt for their farms. E. J. B.

NEW YORK, Preble, Cortland Co., June 30.—Wheat is very poor: some pieces were winter-killed, some so much so that they were plowed up. Corn came up very unevenly and is late for the time of year. Oats are looking fair. It is too early to say anything definite about potatoes; only the "bugs" are very plentiful. Pastures are very short and meadows very light in consequence of the cold, dry weather since the snow went off; we have not had more than six hours' good rain, and from April 28th to May 27th, we did not get rain enough to lay the dust well. Fruit prospects are poor, indeed, as we had so many hard frosts—four in succession—when the trees were in blossom. J. D. F. W.

N. J., Bricksburgh, Ocean Co., June 26th.—With the exception of a slight drizzle yesterday, we have had no rain since the 11th inst., when we had a heavy shower. All crops are much in need of a soaking rain, and from the indications to-day we shall soon get it. Corn has a fair stand. Hay is poor to fair; sweet potatoes are backward, but of good color—they are a leading crop with us. Strawberry picking for market closed about the 17th inst.; the yield was very fair, and the prices better than expected. The mercury, for the last few days, has ranged high. G. A. M'B.

PA., Nittany, Centre Co., June 25.—The spring was very dry, and early summer has been the same. Wheat will average something over 50 per cent. of an average crop in this county. Hay will hardly be 50. Oats are looking well—just heading out. Corn is looking fine: a good deal of it was injured by worms; but the prospects are good for a full crop. Potatoes are good—a large acreage planted. Peach trees are loaded; some are dropping. Apples will be a short crop, this being the "off year" here. Wheat is selling for $1@1.15; corn, 50c.; oats, 25@30c.; potatoes, old, 75@80c.; new, $1.50. Our lands are much exhausted, and there is not enough interest taken in the improvement of the soil in this valley. J. H. B.

OHIO, Businessburg, Belmont Co., June 28.—The prospects for good crops are not so flattering as last season. Wheat is an average crop. With oats the farmers will do well if they get their seed. Corn is now beginning to grow. The season has been too dry for any spring crops. The meadows are very light. If the weather should be favorable from now on during the season, the corn and potato crops might be fair averages. Fruit is almost a failure. Apples will not be a quarter of a crop. There are no peaches. Plums and cherries are very good crops. We are now busy harvesting our wheat, which is principally Fultz and Clawson, these two varieties excelling all others for yielding. T. N.

OHIO, Lima, Allen Co., July 1.—The wheat harvest commenced this week and is first-rate, better than in 1878. Corn looks good, although it is about two weeks later than usual. Flax and oats are looking fine, so are potatoes. Rains through the month of June have made pastures good, and the hay crop will be very heavy. Apples will not be half a crop. S. S.

IND., Lapelle, Madison Co., June 30.—Farmers are now in the midst of their wheat harvest. There never was such a good wheat crop raised in this part of Indiana. Corn and flax, too, since the seasonable rains we have had, seem fairly to spring up. We had a splendid rain the 28th of this month, and now the gardens are beginning to yield a return for all the labor that has been bestowed on them. Potatoes are doing finely; no bugs this year, nor have we many cabbage-worms yet. The few that made an appearance were quickly settled with a good dusting of black pepper. Plenty of wild raspberries and blackberries can be had in the woods. There are no cultivated ones; all were winter-killed. There will be a few apples, but no peaches or cherries. We shall get some pears in sheltered places. The Blunt corn is far ahead of all other corn in the same patch. J. A.

MICH., Shelbyville, Allegan Co., June 28.—Wheat hereabouts will be an average crop, although it was somewhat damaged by frost. Corn is backward. Potatoes are fair, so far. Fruit is going to be better than last year. A. L. B.

ILL, Fairfield, Wayne Co., June 21.—Farmers are all busy harvesting. The weather is cool. Harvest hands are scarce; wages $1.50 per day. Early-sown wheat is good, but late-sown is poor. Oats are very light. Corn looks very well. Potatoes are good. Apples are scarce. Peaches, none. Grass is a very light crop. Prices of produce are: wheat, 75 @ 80c. ₮ bush.; corn, 40@50c.; oats, 25@30b.; potatoes, 60@75c.; eggs, 7c. ₮ doz.; butter, 15c. ₮ lb.; hogs, 2@7c. ₮ lb. E. A. R.

WIS., Wauzeka, Crawford Co., June 26.—The wheat crop in this section is very good. Oats are heavy and very promising. Rye is an average crop. Grass is good; potatoes just middling. Corn is not so promising. Our spring has been too cold and backward for corn. Fruit prospects are not so good; late frosts hurt nearly all fruits. We shall commence cutting wheat in about two weeks. The weather is very warm, accompanied with heavy thunder showers—an excellent growing time. M. T.

MINN., Cedar Mills, Meeker Co., June 25.—Wheat, on the whole, promises at least an average crop; some fields are looking remarkably fine, while others, which were sown later by reason of the drought which prevailed at that time, do not compare favorably with those sown early. Some pieces of wheat are heading out, and it is thought that harvest will commence in three weeks. Oats and barley are looking fine, and corn also promises a good crop. Potatoes will probably yield well, from present prospects. Very few beetles have made their appearance. Fruit prospects are only tolerably good; less small fruits of all kinds than usual. We had an unusually dry winter and early spring, which injured fruit more or less. S. D. L. B.

KANSAS, Parsons, Labette Co., June 28.—Rain, I find by the RURAL, has fallen everywhere during the last thirty days, except just around here. Up to Thursday of this week everything, except corn, trees, and the osage hedges, were burning out. But on the evening of the day mentioned we had a good shower, and on Friday about midday we had a fall of three-quarters of an inch, which was followed in the evening by a rain of several hours, which, added to the preceding rains, made 4½ inches. Our reservoir, for the use of stock, had become so low that the water was so hot and muddy that the fish were laid dead on the margin. This morning I find that it has received, within 36 hours, 140,000 barrels of water, which will serve all the season. It is quite reasonable to suppose that this rain will "make" three-fourths of the area planted in corn hereabouts, as some of it is now in silk. Corn is eight days earlier than last year, which, itself, was early. This is brought about by the extremely hot weather of this month. At least on one-half of the days the thermometer has been 94 deg., or over. The heat was accompanied by strong southwest winds, and had not the soil been generally in a fine condition, there must have resulted severe injury, as in exceptional cases corn had commenced *firing*. We have a reasonable promise for a great yield, and this, coupled with the increased acreage, will give us such a quantity as was never before seen. Our Blunt's Prolific is eight feet high, the stock averaging 1½ inch in diameter, and is in tassel. It was planted April 23. Our ordinary corn was planted about the 10th, but it is behind the Blunt. Wheat is mostly stacked and in perfect condition—a thing that has not happened here in five years, as Kansas seems to have rains in June always, though an exception was threatened in this season. Oats are poor here, as elsewhere. Early potatoes are good, and those late ones recently planted will probably do well. The prairie grass is now too thin on most places to make hay; whether this rain will start the present brown grass, I cannot say. On a portion of our corn land, about half of it was plowed early last fall, and received several inches of rain before winter set in, but so late that no verdure appeared. It was harrowed and made smooth just before being planted this spring. The other portion was plowed this spring, and was in splendid condition—the corn being planted as soon as it was harrowed. The fall plowing seemed to be hard, below the surface, and we had a decided impression that the spring-plowed would excel the other. One farmer, a young one, said that "fall plowing had not succeeded this (the first) winter." Another farmer said we should "find the fall plowing would win, though it might look unpromising." The result is, that the fall plowing is, for a given number of plants, 25 per cent. heavier, and the stand is 15 per cent. better. J. B.

KAN., Phillipsburg, Phillips Co., June 23.—The prospects for small grains are not good. With all our rains we had heavy winds together with hail down to May 30, when it set in dry and we didn't have a drop of rain until the 16th inst. The hail and drought have injured the crops. Winter wheat and rye will not be over half crops. Spring wheat, oats and barley are poor; the heads are short and farmers are plowing under some pieces. Corn is looking fine. "Bugs" have hurt the potatoes somewhat. There are some peaches and small fruits. V. B.

KANSAS, Edgerton, Johnson Co., June 27.—Our drought here is at an end. It commenced to rain on June 20th, and has been raining every day since, and is still raining. This will help oats and flax a great deal, but wheat will be injured in the shock; there is none stacked here yet. Corn and potatoes will be heavy crops. My Blunt corn was planted the latest of any I have; but it is now the largest, standing fully six feet high. I thinned out about half the suckers and left the rest. It beats any corn I ever saw in suckering. Probably the manure caused it. A. B. D.

KAN., Ellsworth, Ellsworth Co., June 25th.—Winter wheat is good. Spring wheat, half a crop. Potatoes are injured by "bugs"—will make two-thirds of a crop. Fruit is doing well where cared for; most of our trees are too young to bear. Peaches are a failure this year; cherries are doing well. All kinds of small fruit are a success. It was too cold last winter for our peaches. This is a good fruit county. W. E. F.

KAN., Kinsley, Edwards Co., June 23.—The weather continues dry. There will be no harvest of oats or barley. Winter wheat will average about five bushels per acre; spring wheat, an entire failure. J. D. B.

NEB., York, York Co., June 22.—I have lately been in the south and west parts of this county and the east part of Hamilton County, and I have found the crop prospects are good, with the exception of rye—it was too dry last fall for that. Corn is just splendid; some were afraid that the small grains would not be long enough to bind, but on the 19th and 20th we had a good, heavy rain, which will help the length of the straw. There will be some few pieces of barley ready in a week or ten days. Farmers are expecting a better yield than last year, and wishing for better prices. Wheat is now worth from 83 to 88 cents; corn, 25c., and hard to get; hogs, $2.50@2.65. Immigration continues at a rapid rate. There have been as high as 26 teams in a single day in York, besides many who are coming by rail. J. B. R.

NEV., Mason Valley, Esmeralda Co., June 20.—We have had a very backward season—the thermometer ranged 50 to 70 degrees in daytime, and from 30 to 35 degrees during night. Grain looks very fair; straw will be short. Barley is our main crop, and will average about 25 bushels per acre, though as high as 60 are reported. Wheat is not a good crop. There is enough planted for home use; it averages about 15 bushels per acre. Oats are not raised generally, and what there is will be a poor yield. I am experimenting with Waterloo White Oats, received from the Agricultural Department; it looks promising. Fruit trees, so far, are only ornamental, late frosts having killed the blossoms. The Pearl Millet from RURAL NEW-YORKER was killed by frost. Defiance Wheat looks well. Haying will commence next week; entirely Alfalfa; yields about five tons per acre. C. F. M.

IDAHO, Salmon City, Lemhi Co., June 30.—The prospects for wheat, oats and all other small grain are good. As to potatoes and other vegetables, we always have good crops, and the prospects now are better than ever before. Corn and fruit have not been raised here successfully, so far. J. S. J.

OREGON, Halsey, Linn Co., June 26.—We had only one shower of rain in May, but it lasted 31 days. Fall-sown wheat looks fine, and is in bloom. Early spring-sown wheat looks good, and that sown late is just out of the ground. The apple crop is light—late frosts injured it. J. D.

WASHINGTON TERRITORY, Alpowa, Columbia Co., June 20.—The farmers in southeastern Washington Territory including the counties of Walla Walla, Columbia, Whitman, Stevens and Yakama, were never in such high hopes of securing an abundant harvest as this season. Wheat is the principal crop in the above counties and the very promising yield is so flattering to the cultivators of this cereal that extensive preparations for securing it are being made many weeks before it matures. Expectations in regard to the yield run as high as 60 bushels to the acre, and even this great yield has been exceeded in seasons less favorable than the present. Home consumption will require only a very small part of this immense crop, and the surplus will be taken to the seaboard, there to be shipped to the markets of the world. Rates of transportation to tidewater are exhorbitant now, but the great number of prospective railroads gives the wheat-raiser a strong hope that he will soon sing the song of "hard times" no more. The growth of oats and barley is exceptionally fine, and an abundant harvest is expected. Corn is quite late, corresponding with the season, but sufficient is *always* raised for home consumption. A great yield is *never* expected, for this is not a corn country. Potatoes in enormous quantities are raised every year, and this season has been a remarkably good one for an extra crop. Apples, peaches, plums, pears and cherries are in great abundance and there is an excellent promise of the quality being very choice. N. A. W.

DAKOTA, Deadwood, Lawrence Co., July 22.—Wheat is looking good; but I don't think there will be any more than enough seed for next year, as a large increase of acreage is likely to be planted. This is the first year in which we have tried corn. Oats are fine; there will be too much for market. This is *the* potato country, and the crop is looking in fine condition. H. C.

MONTANA, Boulder Valley, Jefferson Co., June 22.—Wheat is at present looking very favorable; it will probably be a No. 1 crop, as there are no grasshoppers this year. The outlook for the potato crop is good. Corn in this Territory is of but small account, as there is but little planted, and that is the small and early kind. Fruits, where trees have been set out, are looking very well, though heretofore the altitude has been considered too great for fruit-growing. J. E. R.

WYOMING TER., Lander, Sweetwater Co., June 25.—The weather is fine, and the crops promise well. Young grasshoppers, however, are bothering some of the crops. Wheat last year averaged thirty bushels per acre. Potatoes were so plentiful that hundreds of barrels were thrown away. Cattle are getting fat, but for humans times are still very hard. J. J. F.

CAL., Norwalk, Los Angeles Co., June 21.—This is one of our dry seasons. Crops in general will be light. Of wheat there is scarcely any raised here. Early potatoes are plentiful, and selling at 50 per cental. Corn is a short crop, very low, about 50c. per cental, sacks furnished. Fruits look pretty good. Barley is a short crop. Alfalfa is about the best crop here. N. J. K.

CAL., Fresno City, Fresno Co., June 25.—Wheat, corn, and crops of all kinds are total failures, except on irrigated lands. Fruits will be large crops. H. N. C.

VA., Chula, Amelia Co., July 1.—Wheat is an average crop, although badly winter-killed. Corn is very fine, having been well worked and the season being suitable. The fruit prospects are bad, our hopes being confined to apples and a few defective peaches. Owing to dry weather the early potatoes are a failure; late potatoes are looking well. W. O. H.

ALA., Selma, Dallas Co., June 26.—After a long spell of dry weather we are having a fine rain. This will make corn a good crop: Cotton looks well and will be a fine crop, if the worm forgets to visit it. Not many potatoes are raised here. I don't think that this year we shall have half as many as usual, owing to the injury done them by late frots. Oats are all saved in good order. Cotton is well worked; laborers are doing finely. I hear no complaints on any side. Everyone looks and feels prosperous. J. M.

LOUISIANA, Pattersonville, St. Mary's Parish, June 24th.—We are too far South for wheat; none here. Potatoes are not planted as a field crop. What were planted this season are ripe and dug; our yield was rather below the average on account of drought. Very little fruit is grown here, except oranges. They were in-

jured by the severe winter. The main crop here is sugar-cane. It is planted to the almost entire exclusion of everything else. The crop is below the average. Dry weather caused a bad stand. Corn is very poor. We had little or no rain from Feb. 10th until May 20th.

A. E. G.

TEXAS, McKinney, Collin Co., June 28.—This is the 53d day since we had any rain of consequence, a quarter of an inch yesterday and the day before. However, it has rained abundantly all around us. This drought will somewhat *dampen* the ardor of the hopes on the experimental part of our farm, at the same time it will test the powers of endurance of Pearl Millet and other semi-tropical plants. Oats are in shock—not very good. German Millet and "Millitarian" will not be high enough to mow. There is ample time, however, to secure a crop of hay before frost. Common field corn will not yield over half a crop. Red May wheat is not as good as Mediterranean which will yield from 20 to 25 bush. per acre, bringing 90c. to $1 per bush. in market. Produce of all kinds is lower than usual; eggs, 5c.; butter, 10c.; chickens, 12½c.; no game on the market, as the law will be strictly enforced, so that, in a few years we may expect game to be more plentiful. W. N. W.

CAN., ONT., Metz, June 28.—Spring wheat will be an average crop. Oats and peas look very fine. Early-sown barley is not very good. Apples are a small crop. Potatoes are not far enough advanced to know how they will "eventuate." Hay is a medium crop. There was considerable frost here this spring. We had some fine rains lately, and these will give us better crops. J. L. J.

The Querist.

ANSWERS TO CORRESPONDENTS.

Summer-Pruning Grape Vines.

T. R. S., Benton Harbor, Mich., has a vineyard. He uses no trellis, but trains each cane around a post. Not wanting to renew the canes, he desires to prune them so as to form fruit spurs for next year, and he asks how this pruning should be done.

ANS.—From the letter we cannot form an exact idea of the condition of the canes, or just what pruning is necessary; consequently we cannot answer as confidently as if we were better acquainted with the case. Summer-pruning of grape-vines is a most beneficial operation if judiciously done, but may also prove harmful if done without system or a proper knowledge of what is needed. Supposing that at each stake there is one cane five or six feet tall, with spurs on the sides, from which proceed the bearing branches, these being each year cut back to two buds, we should, as here mentioned, cut each branch off three buds beyond the last bunch of grapes. As soon as all laterals are a few inches long, prune them over the first leaf, and when they start from the remaining bud pinch them again over one leaf, and so continue. There will still be a sufficient number of leaves to assimilate the sap, and, the growth being checked, the berries will receive a greater amount of nourishment. No superfluous branches should ever be allowed. These should all be broken off when they are a few inches long, and what remain should be tied to the stake as well as it can be done without crowding one another.

Miscellaneous.

A subscriber—no address—asks whether there is any danger in using white hellebore to destroy currant worms and other insect pests on fruit.

ANS.—We know of hundreds of cases in which this remedy has been successfully employed, but we have yet to learn of a single case in which its use has been hurtful to those who have eaten the fruit. It should always be greatly diluted, either with water or as much as fifty or even a hundred times its bulk of flour, gypsum or some innoctious powder. Of course it is poisonous, so that unless rain has fallen between the date of its application and the time when the fruit is gathered, it is always safe to wash the latter.

R. S. R., Upper Kanab, Utah, asks whether X. A. Willard has published any work on cheese-making.

ANS.—He has published no special work on that subject, but in his Practical Dairy Husbandry the manufacture of cheese in all its details is treated.

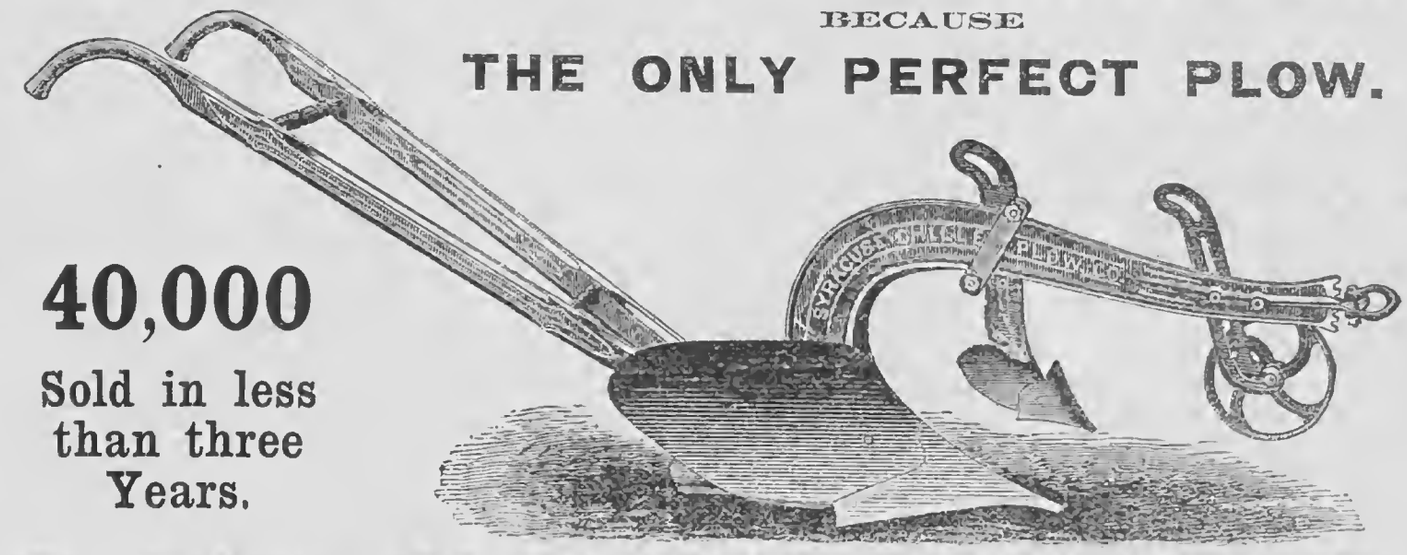
THE SYRACUSE CHILLED PLOW.

The Cheapest and Best in the Field,

BECAUSE

THE ONLY PERFECT PLOW.

Perfect Workmanship.



Perfect Material.

40,000

Sold in less than three Years.

POSITIVE EVIDENCE OF ITS VALUE.

READ THE TESTIMONY.

THE EVIDENCE.

MAYVILLE, N. Y., Oct., 1878.
Your plow suits me. It cleans the best of any Plow I ever used. It is just the thing. W. H. CRANE

MINA, N. Y., Sept., 1878.
I recommend farmers to try one of your Plows before purchasing elsewhere. I am using one, and consider it the best Plow I ever used. D. P. HORTON.

MT. JACKSON, Pa., Nov. 20, 1878.
GENTS:—I have used the Syracuse Chilled Plow, and am fully satisfied that it does better work and in every respect surpasses any Plow that I have ever used.
Yours truly, JOHN R. HAYES

BROADALBIN, N. Y., July 27, 1878
GENTS:—I have used your Plow, and consider it the best in the market. I would not sell the one I have for $100, if I could not obtain another like it.
J. B. CHAPMAN.

GLENVILLE, N. Y., July 20, 1878
SYRACUSE CHILLED PLOW CO.:
Gents:—I have tried a number of the leading Plows in the market, among them the Gale & Remington Carbon, and returned them and bought one of yours, which is the boss Plow, works to a charm, and is the best Plow in the market. Yours,
ISAAC WETHERBY.

SMITH'S CREEK, St. Clair Co., Mich., Oct. 19, 1878.
This is to certify that I have used one of the Syracuse Chilled Plows, and find it one of the very best Plows I ever used for all uses; and, further, my team only weighs 1,400 pounds, and can plow any clay land with perfect ease, and can recommend it to any one needing a Plow for general purposes. If I could not get another of the same kind, I would not take $20 for it.
SAMUEL H. PARKER.

WOODSTOCK, Ct., January 24, 1879.
We, the undersigned, have each within the past year become the owner of a "Chilled Plow" from the celebrated manufactory of the "Chilled Plow Co.," Syracuse, N. Y., and we do not hesitate to say that we believe this implement to be a most useful and valuable invention, and should be in the hands of every farmer.
HENRY T. CHILD,
FOTION SAMPSON,
STEPHEN MORSE.

MT. JACKSON, Lawrence Co., Pa., Nov. 20, 1878.
MR. W. C. HOPPER, Agt.:
Dear Sir:—The Syracuse Chilled Plow bought of you this fall gives perfect satisfaction. I have used your Plow to plow twenty-eight acres, and I find that the Syracuse Chilled Plow is the best Plow for all kinds of ground that I ever used. I think I can plow much more ground in the same time, and one-third easier, than with any other Plow.
Respectfully yours, W. H. HOPPER.

CALIN, Chester Co., Pa., Aug. 8, 1878.
We, the undersigned, having witnessed the performance of the Syracuse Chilled Plow, both Right and Left Hand, in both rough and stoney and smooth land, throwing a furrow sixteen inches wide in smooth land, and fourteen in rough, and from seven to eight inches deep; the rough being in grass and in many places eighteen inches high, do not hesitate to state that we consider it the best Plow we have ever met with, for any purpose.
[Signed by] H. GRAHAM
JAMES PENSON,
And twenty others.

WEBSTER, Mich., June 4, 1878.
SAM. MCLAREN:
Dear Sir:—The Syracuse Chilled Plow that I purchased of you is, I think, the most perfect Plow for general use that I ever saw. I have plowed with it some of the worst soil I ever saw—it being low, mucky stuff, that I have tried to plow before with three different kinds of plows, and the Syracuse Chilled Plow is the only one that would work at all in it, and that done its work very nice, and for draught and ease of handling, I think it has no equal. I have lent my Plow to two of my neighbors, and they join with me in its praise, pronouncing it to be the most perfect Plow they ever saw. Mine is the two-horse, No. 1.
Yours, respectfully, D. F. THOMAS.

OTTER CREEK, Mercer Co., Pa., March 11, 1879.
PACKARD & CO.:
Gents:—In reply to your note of the 5th inst., regarding the merits of the Syracuse Chilled Plow, I would say, that I have used, during the last forty years, almost every pattern of Plow, from the small corn size to the heavy Eight-Horse Railroad Plow, and can honestly say, that the Syracuse is the most perfect for farm use that I ever owned. It will turn down heavy tangled clover and cover every blade, and leave the surface clean and loose, and will work equally well in dirty stubble. It will turn a sod up hill, and unless thrown out by large stones, will keep in the ground with but little attention from the plowman. The head-gear is so well arranged that it can be set to the work as needed, and the draft is very light. It is in fact the plow that every farmer needs.
Very truly yours, M. D. SCURRY.

THE REASONS.

They are a more durable Plow than any other in use.

They will clean in any soil superior to the best tempered Steel Plows.

They possess the like superiority over any Cast Iron Plow, and their draft is twenty-five per cent. less.

We have this season 40,000 of our Plows in the field, and every Plow is warranted to give satisfaction.

Our Plows command a higher price in market than any other Chilled Plow. We do not enter into competition with manufacturers of inferior Plows as regards prices, any more than they can compete with us as regards quality. Our Plows are, however, practically the cheapest Plows ever put into the field.

Each purchaser of one of our Plows is furnished with a guarantee, if he desires it, giving the name of the purchaser, his residence, date of the purchase, style of the Plow, and the name of the agent by whom the Plow was sold. To the guarantee is attached the corporate seal of our Company.

Wherever a colter will work, the Jointer will work, and do all that the colter can do, and much more effectually. When the Jointer Point needs replacing, the farmer can replace it by loosening one bolt, with a new point that will cost him but twenty-five cents. This is a great saving over the time and expense required to re-face and sharpen a colter.

THE EVIDENCE.

PANAMA, N. Y., May, 1878.
I have bought and used one of your Plows, and I consider it in all respects the best Plow I ever used.
LOREN B. SESSIONS.

CANFIELD, Ohio, Sept. 10, 1878.
GENTLEMEN:—I took two of the Syracuse Chilled Plows on trial, this fall, and find them all you recommend them to be. MARTIN NEFF.

HUDSON, Ohio, Dec. 7, 1878.
DEAR SIR:—I have used the Syracuse Chilled Plow bought of you and am satisfied it does better work, and in every way surpasses any Plow I have ever used
WENDEL KROEHLE.

WHEATFIELD, Mich., June 22, 1878.
The Syracuse Chilled Plow is the best plow to hold and run steady, in the market. I think of getting another soon, as I need another plow, in preference to any other kind. WM. BYERS.

HUDSON, Ohio, Dec. 21, 1878.
DEAR SIR:—I have used a Syracuse Chilled Plow bought of you last summer, and am satisfied that it runs easier, cleans better, and does the best work of any Plow I have ever used. My men fully agree with me. JOHN MACK.

WILLIAMSTON, Mich, June 1, 1878.
I was induced to buy one of the Syracuse Chilled Plows of Mr. Lyon, and, after trial, would state that I intend to get two more, and don't want any other kind of Plow for my use. They wear the points twice the length of time the Curtice and don't break.
EGBERT TOMS.

EDENBURGH, Lawrence Co., Pa., Aug. 20, 1878
W. C. HOPPER, AGT.:
I have this day tested and bought the Syracuse Chilled Plow, and unhesitatingly say I have never seen its equal for lightness of draft, workmanship and ease of handling, and holding to the ground when dry and hard; of its clearing properties I have no doubt.
Yours truly, FRED. KEAST.

COITSVILLE, Ohio, Sept. 20, 1878.
MESSRS. ANDREWS, HILL & CO.:
Gents:—The Syracuse Chilled Iron Plow I bought from you this fall is a success. I have used it in *stubble* and *sod* ground and know it is by far the best Plow I have ever used. It runs steady and draws easy, and I challenge any other Plow that I have ever seen to equal the quality of its work. S. F. STEWART.

LIBERTY, Ohio, Sept. 21, 1878.
ANDREWS, HILL & CO.:
Gentlemen:—I have used one of your Syracuse Chilled Iron Plows bought from you this fall, and put it in competition with an Oliver Chilled Plow that I bought last spring, and find upon trial that it possesses many points in its favor over the Oliver Chilled Plow, and I do not hesitate in saying it is by far the best general purpose plow I have ever used, and cheerfully recommend it to any in want of a first-class Plow. JONATHAN KEEFER.

NEW PHILADELPHIA, Ohio, Dec 19, 1878.
SYRACUSE CHILLED PLOW CO.:
Gents:—I took one of your Plows on trial with those of other manufacturers, and among them was included the Oliver Chilled Plow. I gave each of them a fair trial, and have no hesitation in pronouncing your Plow superior to them in all respects. It holds easier, cleans perfectly, and draws lighter, and runs steadily where the other plows would not. I also think it pulverizes the ground and leaves it in the best shape of any plow I ever saw. It will pay any farmer wanting a plow to give it a trial. J. B. WALLACE.

DEERFIELD, Mich., June 7, 1878.
MR. BURNETT:
The No. 1 Syracuse Chilled Plow I bought of you last spring, I can unhesitatingly say is the best general purpose plow that I ever used. After using it upon my farm, I lent it to several of my neighbors for trial, all of whom, with the exception of one, pronounce it a number one plow for business. In this section some of the Chilled Plows fail to clear in our sticky soil. No such objection has occurred here with the Syracuse Chilled. It runs light, holds easy, and turns admirably.
Yours truly, ARMON BARRITT.

PREDONIA, Mercer Co., Pa., March 12, 1879.
PACKARD & CO.:
Dear Sirs,—I take pleasure in stating that I am well pleased with the Syracuse Chilled Plow. I have tried it in sod and stubble ground both, and it gave perfect satisfaction; and I tried it in clover from fifteen to eighteen inches high, and it turned it down so that you could hardly see a stalk, and there were several of our best farmers saw it work, and they said it beat anything they ever saw. As regards scouring, where I could not get another plow to turn without clogging, the Syracuse Plow turned it without a bit of trouble, and I would say to any farmer that stands in need of a plow to try the Syracuse before purchasing any other kind, as I think it is the best.
Yours respectfully, JAMES McCANN.

NIHILISM.

Nihilism, which is simply Russian Socialism, has for its principal object the overturning of absolutism; in place of which it is proposed to establish a representative government. The established Church and some phases of social life come in also for their share of denunciation, but to free Russia from the blighting influence of Imperialism, and to elevate the peasantry, are the two "reforms" which the Nihilist regards as of paramount importance, and to bring about which he is willing to sacrifice his life, if need be. Many who are wont to sympathize with nations that are struggling to free themselves from the yoke of an oppressor, are either coldly indifferent to the present efforts of the people of Russia, or regard the movement with disfavor. The reasons for this are, first, the impression which prevails that the Czar is a wise and beneficent ruler, beloved by a people who are content to be his subjects; and then the methods the Nihilists have adopted to attain their ends have prejudiced many against them.

The only ground for thinking the Czar "wise and beneficent" is the fact of his abolishing serfdom. As this, however, was a political and not a philanthropic measure, there is very slight foundation for the "beneficent" theory. The insurrections and petty rebellions which follow each other in such quick succession as to make a standing army of a million, or more, of men necessary for their suppression, and Siberia, that living grave, are eloquent witnesses of the kind of contentment developed by the rule of the Czar. It is impossible to defend assassination, whatever the provocation, but still there is something to be said in extenuation of the Nihilists' terrible methods of bringing about a political regeneration in Russia. It is not wholesale butchery, nor do they "strike in the dark." There have been only some twenty assassinations, and the victim is repeatedly warned in advance, so that his life lies in his own hands. He is invariably one who has been guilty of acts of heartless brutality and tyranny. No person in private, civil or military office has fallen before the dread vengeance of Nihilism. When it is remembered that thousands—some estimate the number at 15,000—have within the last few months been exiled on account of supposed sympathy with the reform movement, without being allowed a trial, banished on the word of a Government spy, one wonders at the marvelous moderation of these men, who, keenly alive to the tyranny under which they live, and burning to avenge the wrongs inflicted on their kindred and friends, yet content themselves with so few victims.

In a measure the *role* of assassin has been forced on the Nihilists. Their petitions for redress have been answered by atrocities which rival the heartless cruelties of the most uncivilized of nations—witness the Students' Riot, in December, 1878—and as no opportunity was afforded them to make themselves heard through the ballot, what was there left them but the bullet? Assassination is a most terrific crime; of this there can be no question; but upon whom should be laid the responsibility in this case—the ruler whose government is a cruel despotism, or the poor men who have seen their brothers, fathers, yes, and mothers, sisters and wives, condemned to imprisonment, and to four, eight and twelve years' hard labor in Siberia, on the word of a spy acting for the "wise, beneficent" Czar? There is absolutely no redress. What shall the Nihilist do? A wise ruler might by timely concessions avert a revolution, but the Czar has shown no disposition to try the experiment. He ignored the demands for reform as long as he could, and when by threats and bullets the Nihilists compelled a hearing, the Czar chose to deal with them simply as assassins, and by executions, banishment and the maintenance in some portions of his dominion of a state of siege, he is attempting to crush out the spirit of revolt, which in a despotism is always the forerunner of liberty. What measure of success will crown his efforts, remains to be seen.

The most superficial student of Russian history knows that the Empire of the Czars is, and has been for centuries, in a state of chronic revolution; but these numberless attempts to resist the tyranny of the government have failed mainly because the peasantry are so degraded, superstitious and apathetic that it has been all but impossible to secure their co-operation. A few earnest souls, burning to deliver their country from thraldom, have more than once rashly undertaken the mighty work with inadequate preparation, and paid for the venture with their lives and the death and banishment of their kindred. The Nihilists of to-day are shrewder; they have set before themselves the task of educating these millions of peasants to a realizing sense of their degradation, and inspiring them with a desire to be freemen. The times are propitious.

Several things have conspired to influence the popular mind against the existing order of things; chief of which are the legacies resulting from the Turko-Russian war. As a consequence of that expression of Imperial ambition, the Russians find themselves to-day with increased taxes and a currency depreciated to one-half of its original value—a state of things which hardly inclines them to view with favor a government for whose philanthropy (?) they have to pay so dearly. Another result, is that the Russian soldiers who freed Bulgaria from Turkish rule have not been oblivious of the fact that the Bulgarians enjoy greater liberties than they do. "Shall I free others and remain myself a slave?" is being asked by the returned volunteer, just as a question somewhat similar was asked by the soldiers of Lafayette on their return to France, after having aided in establishing our own independence. The French soldier's query led to the great French revolution; to what will the Russian soldier's lead? All who have the interest of humanity at heart must earnestly desire that an end should be put to the system of tyrannical oppression and persecution practiced by the Russian government, but can lovers of justice and morality welcome men professing the principles of Nihilism to the government of a country like Russia? So far as they demand civil and religious freedom, Nihilists must command the sympathies of all in their struggle against oppression; but when they avow themselves opposed to all religions and at war with the institution of marriage, they must expect to be regarded and treated as foes dangerous to the well-being of society.

SOAK THE ROOT SEEDS AND GROW ROOTS.

It is much the best way to soak all kinds of root seeds before planting. When soaked for four days, they will come up in the same number of days, and get the start of the weeds. This early growth will save a large amount of weeding and hoeing afterward, which is the most discouraging part of root-growing. Seed may be soaked in dry weather without any danger of "going back" or not growing, if the ground is slightly packed. This prevents evaporation, and will insure germination. Turnip seeds may be sown by a drill, after soaking, by first rolling them in plaster or flour, to cause them to separate, so that they will drop readily. Beets and mangels should be planted by hand and covered with a hoe. The depth should be according to the condition of the soil,—if damp, an inch deep; but if dry, fully an inch and a half. A furrow the right depth can be made with a hoe, and the seed dropped into this, sixteen inches apart.

We like the plan of planting turnip seeds, especially Swedes. They are put just where they are wanted, and, if soaked and swelled beforehand, will come up in two or three days. By planting the seed there may be a saving of three-fourths, and the care afterward will be lessened fully one-third, if not one-half. As soon as the rows can be seen, the cultivator should be started and run as close to the young plants as possible. A cultivator with harrow-teeth is much the best at first, and then, when the plants are larger, one with the outside teeth made to throw the earth toward the center of the row. By using these implements promptly and frequently the amount of hand labor is reduced to a small percentage in the care of the crop. Hand-labor is the great bugbear in the production of this crop, and prevents its more general growth.

Roots, properly managed, are the best crop a farmer can raise. More food can be produced by them on a given spot of ground than of any other crop. Roots, more than anything else, are the backbone of English husbandry. They make the finest animals and the best meat at the least cost. Corn, the American staple for making meat, is a feverish food, and must have an effect on the flesh of animals fed on it, and this flesh doubtless has its effect on the constitutions of those who eat it. We want more of the cooling and healthful influence of roots, in the various phases of our diet. The food of a nation has as much as, if not more, to do with the character of a people than anything else. Roots make tender and juicy meat, and such meat is more easily digested. Corn makes firm and oily flesh, which lays the foundation for dyspepsia. English mutton is easier to digest and more palatable than American. Turnips make the difference. We need more succulent feed for stock during our long and trying winters. With more roots there would be less constipation, barrenness, less abortion, less disease of nearly all kinds.

Swedes, a very productive and excellent root, may be put in up to the middle of July, and flat turnips until the first of August. Swedes may be kept over until July. Fifteen and twenty tons can be raised on an acre. They can be put in after a crop of clover or early grain. The ground should be made mellow and rich with barn-yard manure. Three feet apart is a proper distance for the rows, or they may be closer. A pound of seed is ample for an acre, when put in with a drill, or one-fourth of a pound when dropped by hand sixteen inches apart. Several seeds ought to be put into one place, to allow for flies and accidents.

PRICE OF GRAIN LIKELY TO BE HIGH THIS SEASON.

In a public speech, some months ago, the Earl of Derby conceded that in view of the unlimited facilities possessed by this country for producing all cereals cheaply, and of the impossibility of re-establishing the old-time corn laws for the protection of domestic agriculture, the time was close at hand when the British farmer should abandon grain-growing and seek his profit in meat-production, leaving the supply of bread-stuffs to the bountiful harvests of this country. Despite the late reductions of rent, pretty general throughout the country, hundreds of good farms have this year and last been thrown upon the hands of the landlords, because farmers feared they would be unable to "make both ends meet" if they rented them. Such abandoned farms are, in nearly all cases, turned into meadow or pasture lands, so that the area under cereals in Great Britain is rapidly diminishing every year, while the population is increasing at the rate of 1,000 a day. Already Mark Lane and other English grain markets have ceased to be affected by changes in the weather beneficially or injuriously affecting domestic crops. Last week the telegrams reported that the weather throughout the British Isles was very unfavorable to the crops, and that at a critical season; but they also reported that in view of the slight dependence lately placed on the home supply, and the bright crop prospects announced from this side of the Atlantic, the grain markets had remained unaffected by the unseasonable weather.

Last Saturday the French Ministry announced that in view of the scant harvest this season throughout the greater part of the country, France would have this year to import $100,000,000 worth of foreign grain. As a rule, that country is an exporter of cereals to a considerable extent, so that this year, not only will those countries which have a surplus of cereals have to supply nearly $100,000,000 worth of grain to the French market, but they will also have to furnish to other countries, chiefly to Great Britain, the quantity hitherto drawn from France.

The latest advices from Southern Russia, our chief competitor in the grain markets of the world, are highly unfavorable. Wind and rain storms have greatly injured the crops in the territory tributary to Odessa, while swarms upon swarms of locusts have ravaged many parts of the country. From Germany, late crop reports are good; but it is hardly probable that there will be much of a surplus of any, except tobacco, for exportation. There is considerable agitation in Spain for the repeal of duties on importations of cereals, but in view of the fair outlook for the domestic harvest, the ministry this year have felt themselves strong enough to concede only a slight diminution of the tax on imports of flour. Italy is pretty sure to be one of our customers, or at any rate she will not be able to spare any cereals to compete with ours in other markets.

On the whole, the grain crops in Europe this year are very considerably below the average, and the deficiency is precisely in those countries in which it will do us the most good. Great Britain and France are, both by situation and friendliness, naturally our greatest customers, and as both are wealthy, they are also our best. As in both of these the harvest is especially small, their demands on our surplus will be especially large. Moreover, the mishaps that have lately befallen crops in Southern Russia, by crippling our greatest rival, will raise the price of our products by curtailing exportations from that quarter.

PRICES OF FERTILIZERS.

We consider artificial fertilizers to be a prime necessity in the pursuit of agriculture. No farmer can hope to procure the highest profit from his business without their use to some extent. At the best, a farm that is worked on the self-supporting system as regards manure, must lose its fertility to some extent; slowly, more or less, it may be, but surely. But there is small encouragement held out by the manufacturers of fertilizers for farmers to use their wares. The prices exacted for them are excessive. This is shown by the irregularity in the price lists. One entirely respectable and responsible manufacturer may offer superphosphate at $25 per ton, and another may ask $40 for an article which may be no better. The basis of the market rates of fertilizers is fixed, in a measure, on the prices of Peruvian guano. But the trade in this article is a huge monopoly. The Peruvian Government has hypothecated its guano and nitrate deposits to its foreign bondholders, to pay the interest on large debts, and it exacts a large price. To make these articles the basis of the price of nitrogen in other fertilizers (such as sulphate of ammonia, which is a by-product of gas works), is monstrous. So with potash salts, which are a refuse of the German salt mines, and dried blood and flesh, which are the refuse of the large slaughter-houses, and were formerly disposed of by flowing or dumping into rivers. Before farmers can be induced to use these fertilizers to any large extent, the prices must be reduced.

BREVITIES.

The Japan Persimmon was alluded to at the late Cleveland Convention as of doubtful hardiness. There need be no doubt about it. It is not hardy or any approach to it.

Last week we selected an average head of Clawson wheat not cultivated (sown broadcast), and an average head from our cultivated plot. The first contains 30 grains, the latter 37. The latter were larger, also, than the former.

And now Mr. Roe follows Mr. Lovett, who stated last year, in the Rural, that Belle de Fontenay and Henrietta Raspberries are the same, and was strongly contradicted by several correspondents. Mr. Roe says: "I cannot tell them apart."

The Pinxter (Azalea nudiflora) blooms in May, and before the leaves are half grown. Now, A. viscosa is blooming. Its flowers are large, generally pure white, and covered with a viscid fluid of sufficient tenacity to hold little flies, aphides, and other minute insects that venture upon them.

In the report of the New Jersey Bureau of Statistics, the Secretary speaks of the Indian Mallow, or Velvet Leaf (Abutilon Avicennæ), as a plant which yields a strong fiber. The plant is a native of India, and is now naturalized in most of the States. Steps have been taken to test its value thoroughly.

We call the attention of our California readers to Teosinte, which the Rural was the first to illustrate (see our issue of Nov. 2, 1878, page 695) as a fodder plant. It tillers remarkably and the stalks are sweeter than, and do not become so hard as cat-tail millet. It will stand drought and heat and we should suppose might prove serviceable in the climate of Middle and Southern California.

To Kill the Peach Borer.—To kill the larvæ of the peach borer, that may be at work on the trees, and to prevent egg-laying, apply to the base of the trunks during July and August the following compound: To ten gallons of soft soap add as much hot water; then stir in half a pint of crude carbolic acid and let it stand over night; next add three times its bulk of water, and it is ready for use.

We learn that the expenses of the last New York Horticultural Society were $800. The receipts were $400. If the florists and horticulturists would think a little more of "the advancement of horticulture," that they talk so much about in their essays, and less of "the advancement" of their business, we might hope that the outside horticultural public would show a livelier interest in their exhibitions.

There is but one object in pot-layering Strawberries, viz., to insure a heavier yield on a new plot than can be accomplished in any other way. If we desire fifty plants of any variety, as many pots—say three inches in diameter—must be sunk in the earth under as many runners, and filled with soil. The runner must be pressed into the soil of the pot and there held by a little stone or lump of earth. As soon as these runners are well rooted, they are thumped out of the pots and set in the ground prepared for their reception. In this way the roots are less disturbed than they would be if the runners were dug up and transplanted in the usual way.

Literary Miscellany.

GEMS FROM POPULAR POETS.

My name is J. L. Sloss,
Of money-brokers I'm the boss.
And a pillar of the church I be,
I pass around the plate,
A pious look I cultivate,
And I never, hardly ever, use a big, big D.
[*William Cullen Bryant.*

There is a boarding-house, far, far away,
Where they have fried ham and eggs
Three times a day.
Oh, how them boarders yell,
When they hear the dinner bell;
Oh, how them eggs do smell
Three times a day.
[*Oliver Wendell Holmes.*

A gushing young damsel, Lucinder,
Leaned out of the back bed-room winder,
'Neath which her lov-ar
Lightly picked his guitar,
With no bull-dogs or shot-guns to hinder.
[*Longfellow.*

A hysteric creature, Deborah,
Sat admiring the crimson Aurora;
When a mouse in distress,
Ran under her dress,
She fainted and fell on the floor-ah.
[*Walt Whitman.*

There was a young lady from Muscle,
Run off with a feller named Russel,
They came to this town,
And were walking around,
When our billy goat busted her bustle.
[*Henry W. Longfellow.*

Now the swell in style arrayed
Goes forth to promenade,
But wilts 'neath the fervor of the sunbeam's glance,
And so do his collars and his jackets and his pants.
[*Shakespeare.*

Two heads with but a single thought,
Two hearts that beat as one!
Two pairs of lips in suspense held—
Two little smacks—yum! yum!
[*John G. Whittier.*
